S. ALLCOCK & CO.
FISH HOOK,
ROD LINE, TACKLE,
AND SILKWORM GUT MANUFACTURERS,

STANDARD WORKS, REDDITCH (ENGLAND) HARDY'S NEW PATENT WINCH FITTING.

Having purchased the sole right of Hardy's "New Patent Winch Fitting," for Fishing Rods or other articles to which the invention may be applied, we take this opportunity of introducing it to the notice

DIAGRAM No. 1.

DIAGRAM No. 2.

PRESS NOTICES OF HARDY'S PATENT WINCH FITTING.

THE FISHING GAZETTE, July 30, 1880.
"It will be seen at once that the brass plate on the winch for holding it to the rod, instead of being held by brass rings, as is now usually the case, is slid along the grooves, A A, in the new fitting (which is let into the butt of the rod) and is held in place by them and by the locking bolt, C. Here, then, we have a fastening which offers the following great advantages:—1st. The winch can instantly be attached to or detached from the rod. Every angler knows what a nuisance the old rings are, very often either loose, or else too tight. Now, fishing with a winch which feels loose and may fall off at any moment, (when wading, too) is worrying, and breaking one's knife or nails over a "stuck" ring to get the winch off is worse. 2nd. The winch is held perfectly firm, and the ordinary blister-raising brass rings are absent, so that one can grasp the rod quite close to the winch."

THE FIELD, Sept. 10, 1881.
"The present system of fitting on a winch is somewhat cumbersome, and the manipulation of the sliding ring, which slips over the slab of the winch, is often troublesome, both to get on and off, often sticking from wet, etc. Messrs. Allcock & Co., of Redditch, have brought out a new method of winch-fitting which is very simple and satisfactory, and the reel can be put on or taken off instantaneously."

FOREST AND STREAM, (New York.)
"The new patent winch-fitting which Messrs. Allcock & Co., of Redditch have just purchased the exclusive rights of is the best invention for rod-fitting ever introduced."

BELL'S LIFE, August 6, 1881.
"It promises, indeed to be the fitting of the future. We have here a very simple, yet marvellously complete and effective, contrivance. Moreover, it is one that will entirely do away with the annoyance which often ensued when the old-fashioned fitting, swollen with wet & damp, contracted in the course of a day's fishing, obstinately refused to move. The new fitting appears to us to be admirable in every way."

BIRMINGHAM DAILY POST, Sept. 5, 1881.
"The new fitting is so simple, so convenient, so easy of application, so certain in its arrangement that the only wonder is it was not brought into use years ago, for, like many other really practical inventions, its simplicity is obvious at a glance."

BIRMINGHAM DAILY GAZETTE, Sept. 7, 1881.
"Messrs. Allcock & Co., of Redditch, the well known manufacturers of fishing appliances, have purchased the exclusive patent right of a new winch fitting, which obviates all difficulties experienced with the old fitting. It is not only effective in working, but is handsome in appearance, and should become as great a commercial as it is a practical success."

THE NEW REGISTERED "FISHING GAZETTE" WINCH.

MADE IN ALL SIZES, WITH CHECK AND WITHOUT.

MESSRS. S. ALLCOCK & Co. beg to draw special attention to this Registered New Winch, which they have brought out in conjunction with the Editor of the "Fishing Gazette" and the inventor Mr. J. T. HARRIS. The great advantages offered by this Winch are:—

- 1.—Its peculiar shape gets rid of that nasty angle between the winch and the rod in which the line so frequently catches, causing loss of fish, especially in salmon, trout, and pike fishing.
- 2.—Its peculiar shape gets rid of the weak point which must exist in all winches which are fastened to the rod by a plate held on only in the centre. A glance at the illustration will show the great distance the screws are apart compared with the ordinary winch. This gives an immense increase of strength, and prevents all chance of shakiness or breakage.
- 3.—Its peculiar shape gets rid of the unnecessary side bars, the line runs off easily without friction on the bar, and dries easily.

*** The form of this Winch recommended by the Editor of the F. G. is with a SILENT GENTLE CHECK.*

The New Improved Registered Fishing Gazette Live Bait Float, which can be put on the line and taken off in an instant.

The New Registered "Gregory" Spinal Rod, Cap and Ring for Winch-fitting which is Indestructible.

The Patent Luminous or Glow-worm Float, enabling a Fisherman to fish in the dark.

The Fishing Gazette Leads, made on an Improved Principle.

The New Durable Phantom Bait.

The Sole-skin Phantom Bait.

The Hexagonal Split Bamboo Rods.

The New "Fishing Gazette" Gregory's Spinning Bait for Pike or Salmon.

The above New and Special Goods can only be had through Respectable Fishing Tackle Makers. The Patent Winch Fitting can be had affixed to Rod or separately.

Messrs. S. Allcock & Co. Supply Wholesale Only.

N O T I C E.

Communications relating to the Literary Department, Fishing Tackle for Notice, Books for Review, &c., must be addressed to the Editor of THE FISHING GAZETTE, No. 12, *Fetter Lane, London, E.C.* and should reach the office not later than Tuesday morning.

Contributions are solicited, but the Editor will not undertake to return rejected MSS., unless accompanied with a stamped addressed envelope.

Correspondents are requested to write on one side of the paper only and give their real names and addresses, not necessarily as signatures to their letters, but as a guarantee of good faith. Unless this rule be adhered to no notice will be taken of such communications.

THE FISHING GAZETTE is published every Saturday, and can be obtained at Messrs. W. H. Smith and Son's Railway Bookstalls, and of the following, amongst other Fishing Tackle Dealers in London and the Provinces:—

Messrs. Alfred and Son, Moorgate-street.
Messrs. Price and Co., 8, Seymour-street, Euston-square, N.W.
Messrs. Williams and Co., Great Queen-street.
Messrs. Gee and Co., St. Andrew's-street, St. Martin's-lane.

Mr. John Cocks, Baker Street, Weybridge, Surrey.
Mr. Wm. Reid, Northgate, Darlington.

Newsvendors can obtain the journal through their London Agents.

* * The "FISHING GAZETTE" SPINNER (Registered) is sold by all the above firms.

ANNUAL SUBSCRIPTION.

The Annual Subscription, payable in advance, for the United Kingdom is 8s.; or post free, 10s. 6d.

To any part of Europe, the United States, and Canada, the Annual Subscription, including postage, is twelve shillings and sixpence.

ADVERTISEMENTS.

All communications respecting advertisements must be addressed to the Manager of THE FISHING GAZETTE, No. 12, *Fetter Lane, London, E.C.*

N.B.—All Remittances must be sent, and all Cheques and Money Orders must be made payable to ROBERT B. MARSTON.

The Fishing Gazette.

SATURDAY, DECEMBER 25, 1880.

A NEW YEAR'S YARN.

"YES, that's jist fortin year ago. I 'members it as it bin but yesterday." This was uttered by a fisherman, one among a group of five lounging on ——— Bridge on New Year's Day. The snow was falling fast, and a sharp frost had set in.

"You're right, old Carrot," observed another they called Ned,

"and I can swear to every 'dential word, for I was your mate during the whole of that time."

"It's a large mouthful to swallow," said a listener with an incredulous grin.

"I wish my breath may never blow froth off beer again," declared Carrot, "if it arnt as true as—as—"

"Yourself," suggested the unbeliever, upon which there was a roar of laughter from the rest of the group.

"Always on the watch to get a wrinkle anent the river," I beckoned old Carrot and Ned, from their companions, spoke to them confidingly of beer and gin, to which they their ear did seriously incline, and we entered the snug little parlour of the public at the foot of the bridge overlooking the river.

"Now, my men," said I, "have what you like."

Carrot smacked his lips with the snap of an uncoiled lock, and uttered the words:

"Flip, made with Ind, Coope."

"How much can you drink?" I asked. "The day is cold, and it is always better made in bulk."

"Any *given* quantity," he replied, with a chuckle.

I refrained to give him credit for his hint, as Robert Brinsley Sheridan had said the same thing before.

"A quart?" I asked.

"Two," said he; "there's Ned to help."

"Three?" I rejoined.

"We'll try," he added.

After a moiety of this quantity had been disposed of between them, for it was too early for any indulgence in such seductively heavy stuff, I requested Carrot to tell me what it was that he had been speaking of as occurring just fourteen years ago on that day.

"Well, master," said he, "leastwise I must have a pipe, and a little more gin in the next pot, for this last is only dog's-nose, and not the real regular flip; there is a smell of eggs in it, but the jacky must have gone over the side."

"Order it as you like; but on with your story."

The pewter being replenished to Carrot's estimate of the proper flavour of the compound, he commenced his narrative:—

"Many years ago a patron of mine, none of your stingy bread-and-cheese-and-beer chaps was he bred, but a hamper gentleman—raised pies, port, sherry, whisky and cigars. 'All equal when afloat,' he would say. 'What's mine is yours, Bill, so help yourself, and don't overwork. Pitch into that cold pheasant; stick your fork into that tongue; draw another bottle of that yellow seal; have a nip of this "curious so." Throw the stump of that Havannah away, and light another; here's my case.' And if it was hot weather he would say, 'Put me under the shade of those trees while I get a nap, and you can give yourself a glass or two of hollands from the square bottle. You'll find it prime, and the river water is just soft enough for it.' So, while he had his forty winks at the rate of about one a minute, I used to serve all the bottles alike, and before he was stretching himself again, you may be sure I had had my whack besides filling a private bottle I always carry about with me for such emergencies. Then he would declare he had had enough fishing for the day, although he hadn't caught a fish, and would go ashore. Tell me I might take the remainder of the contents of the hamper and the rest of the liquor home, or give it away, which the latter I didn't do; and then, after giving me a couple of sovereigns, we would order a fly and go over to—— to catch the train, for we had no railway here at that time. Now, sir, that was the sort of life I liked to lead; no exertion—get under the first bushes and lie on your back in the sun, and swizzle and call it chubbing. Well, on this occasion which I wish to tell you about just fourteen years ago on this blessed day, I got a letter to say he should leave the shop and come down on the following Saturday, which, between you and I, sir,

meant not only for us to have a clean punt with live and other bait and prepare a swim or two—for he liked an hour's bottom fishing—but to have the well pretty full."

"Pretty full of what?" I asked.

"Of fish, of course! Why, sir, you beant no angler, I can see, or you'd know what I means."

I expressed my ignorance.

"Why, you see, sir, although I say he was an out-and-out gent, free with his brads and grub and all that, he was not one of those sportsmen who don't care about the fish they catch, 'cos you see he used to show them to his friends in Shoreditch, and take the credit of catching the lot, when perhaps a perch or two was all he laid hold on with the hook. So you see, sir, me and Ned used to go out each day, afore he came down, both with cast net early in the morning, and rod and line arterwards, and make up a stunning lot of fish for him to take away to town. Well, sir, on this 'ere New Year's Day I am speaking on, a chap as was with some strolling players at Reading, who I knowed when a boy, axed for to go out with us, and as he was a pretty fair fisherman, we took him. We started just afore light, and arter a few throws with the cast net, over some holes we had ground-baited, we pitched the punt under them willows you see there, and went to work for chub—I always bait with half-boiled carrot, that's why I am called so—and, as luck would have it, Cross-Eyed Tom—that was the lad—got hold of the first fish, a chub of about 3 lb. He brought it round for me to land. Well, sir, I hope this flip may choke me if the fish didn't call out, as I was putting the landing-net under it, 'You let me alone, Carrot, will you!' as plain as I speak now, and the fish made a dash out into the main stream. Cross-Eyed Tom gave him line and brought him up to the side of the punt again. And I wish," added Carrot, with vehement emphasis, "that the sausage-maker may have me if the thing didn't open his mouth, throw out the bait and hooks, and cry 'Did you think it, Carrot!'"

Here Carrot became so affected, either with the flip or the horror of the occurrence, that he forgot to take the pewter from his lips until it dropped empty from his grasp, and he slid off the chair as though it had been buttered, and he lay in a heap on the sanded floor.

"Never mind him, Master," observed Ned, indifferently, "it is only a way he has got. He'll be all right presently."

"But about the talking fish?" I remarked.

"Oh, I can go on with that, master," and Ned took up the thread where Carrot had dropped it. "Well, both me and Carrot was so stunned we did not know what to say or do, and not another bite did the three of us get that day. Well, the next day we went out after jack, and got four trimmers out besides our three rods, when Cross-Eyed Tom, who was fishing with a gudgeon, had a run, and just as he did with the chub the day before, he tackled it up to within reach of the landing net. The fish was about 5 lb., and came to the surface with its eyes as fierce as could be, snapping and tugging at the line. 'It's all right,' says Carrot, as he got the net well under it. 'No it isn't,' says the fish; 'don't you know me, Carrot? Didn't I see you when you were poaching the ditches where some of my mistresses spawn. And don't I know where you keep the flue net which reaches across the river. And——' 'Hold your tongue, you beast,' cried Carrot, and had the fish on the bottom of the punt in a jiffy. 'You had better let me go,' says the fish, 'or I'll tell your pul here that it is you and not him that ought to pay that three bob and a tanner a week.' I saw that Carrot trembled ever so, yet he got the snap hook carefully out of the jack's mouth, and pretending to carry it to the well, stumbled and dropped it overboard. And the whole of that day we did not get another fish. Carrot was like a mad-man about our bad luck. We had a few fish in the well, but not

sufficient to satisfy the master shoemaker, for that's what he was. Carrot looks into the well, scratching his head, and says, 'This won't do.' 'No,' says a voice from the well, 'and if you don't let us go we'll sink the punt.' Lord! didn't Carrot holloa then! He took the scoop and ladled out every fish into the river."

"Don't you think, sir, it was the devil, come to make Carrot pay the parish fee, as he did arter that?"

"No," I replied. "The explanation is clear enough. 'The strolling player was a ventriloquist. He had the power of throwing his voice into the fishes' mouths; and as he was doubtless well acquainted with Master Carrot's little tricks, used his art to touch his pocket and his conscience at the same time.'"

"But the devil does interfere with fishermen sometimes," urged Ned. "I have a book at home, left by a customer of mine, where the devil went fishing for souls, and made a fool of hisself."

"Indeed," said I; and my eagerness was enough, for he went off to fetch it. It was a common ruled copy-book, the narrative in manuscript, and was as follows:—

"On one occasion, after fishing many miles of water, with nothing but a few perch and jack in the well as the result, we dropped down to the weir. Wearied with no sport, and the day being hot and sultry, I stretched my listless length on the dry boarding that flanked the main weir, and watched with half-shut eyes through the tremulous aerial medium that often attends a warm summer's day, the osiers on the left. The thundering of the fall had, by degrees, something soothing in it, and I felt that I was sinking fast into a doze, when I beheld a tall figure, in rusty black, with a club-foot, swarthy, sharp visage, and an eye that positively glared, looking down upon me.

"'Ah,' said he; 'no sport! Well, I, too, am a sportsman, and a devilish bad sportsman (here he winked), but I am getting old, and I cannot walk the weirs now.'"

"How he could ever have walked the weirs with that foot of his seemed a mystery; but the love of sport will carry people over anything."

"Finding I made no reply, the figure continued:

"'What would you give to have on your line that fish, whose glittering side you saw but now, as he leaped from the river, till his splash was heard above the noise of the waters?—he that was afterwards chasing the bleak on the shallow till his huge shoulders and back were fairly shown?'"

"'Anything,' replied I; for I had been watching this fish—a twelve or fourteen pounder at least—strong on his feed, and making the small fish skip into the air before him. 'Anything.'"

"'I do not want anything very substantial,' said he, meekly.

"'I looked up.

"'You said awhile you would give anything?'"

"'I did.'"

"'You will give it, then?'"

"'Certainly.'"

"'Agreed.'"

"He produced a small but most brilliant fish—such a one as I had never seen, and I had seen many—a kind of miniature opal or king-fish, and fixed it on the trace most skilfully.

"'You don't repent?' said he.

"'No. But I am to have that great fish on my line?'"

"'Yes.'"

"'And land him?'"

"'The fish shall be landed.'"

"'I shall want to send him to town. Can you meet me at the church with a basket?'"

"'I don't go much to churches,' said he; 'people would stare at me so; but if you mean there (as I pointed with my rod towards the tower), I will see you in the churchyard.'"

"I examined my splendid bait to see that it was all right.

Neither Pennell, Francis, or Wheeldon—no, not even Wilder—could have arranged it better. I tried it in the still water, and it spun admirably. When I raised my head to praise the baiter he was gone.

"I was anxious to try my bait, and beckoned to my puntman, who was sitting on the other end of the long weir-beam by my companion, as the latter was fishing between the two last spurs, near the eddy in the corner. He came.

"'Have you had a run?' said I.

"'Yes, but not from the big fish, although the one as come at us was a *solaker*—I put him at seven or eight pounds.'

"'Where was it?'

"'There, in the corner. He came out of the foam and took us in the *wambling*, but the hooks drew.'

"'Then the fish are on the feed?'

"'Yes, the sun has drawed the baits up close to the weir; and the fish have come up arter them. That great fish drew the baits right out of the water but now, at the far side there, just by that shallow.'

"'I showed him my bait fish.

"'Where did you get that?' said he. 'And who put it on?'

"'Did you not see the man in black who was talking to me?'

"'No. I sid no man in black. I sid a great, dark-looking heron fly away just beyond them osiers, and I wondered how he came to let you be so nigh him. You must ha' bin werry quiet.'

"I began to climb on top of the weir-beam.

"'Is it any use to try again, think you?'

"'It's a wery odd bait as ever I see,' responded my attendant; 'but it's wery bright, and you may as well try the weir over with it.'

"I stood on the weir-beam.

"Now, no one who has not walked the Thames weirs can tell what a task it is to walk them till practice has made it easy. The weir in question is one that affords as steady a footing as any; but to stand on that narrow beam for the first time, whilst the ear is stunned by the roar of the fall, and the head reels as the eye is dazzled with the raging, boiling white water of the pool, fifteen feet below, demands good nerves. To fish in such a position requires strong ones.

"My bait was at one time spinning far down in the pool thirty yards off, and at another, as I shortened my line, which then lay at my feet on the beam, or hung down from it, and reversed my rod, it was glittering close beneath me in the foam on the apron. Suddenly I lost sight of it, and, at the same instant, there was a snatch that I felt to my spinal cord. I had him! I raised my rod in the twinkling of an eye, gave him the butt, and up he sprang into the broad sunlight, showing a side like a sow.

"'Don't check him!' cried my man, in a voice that was heard above the river thunder. Out ran the line. Who can be collected in such a moment? It coiled round my ankle, and down I went headlong into the mad waters below.

"Strange as it may appear, my principal anxiety, as I struck out into the pool to avoid being sucked back under the apron, was to secure the fish, which I felt was still fast. This embarrassed me, and, notwithstanding my efforts, I was drawn back into the weltering waves under the weir. I looked round, and there I beheld that dreadful face glaring ghastly at me through the smooth glassy sheet of the falling water; and I felt the long deadly arms dragging me feet foremost under the apron. In the delirium of despair I cried out—'You said that I should land the fish?' 'I said,' shouted the fiend, 'that the fish should be landed, and that I should see you in the churchyard;' and he mercilessly pulled me under.

"Lord! Lord! methought, what pain it was to drown. The long cruel arms kept pulling me deeper and deeper. The bright-

ness became less and less. My agony was inexpressible. Then came darkness—the blackness of darkness. Suddenly my sensations were even pleasant, and I fancied I was in a delicious meadow. A fearful change succeeded—I found myself in a burial vault.

'Girt by parent, brother, friend,

Long since numbered with the dead,

and there was that grim form still claiming me, and the long lean arms were stretched out to grapple me, and the grasp entered into my soul. I turned to make one desperate effort to escape, and opening my eyes I found myself still stretched on the dry boards. My companion was shaking me by the shoulder, and inquiring with something like reproach if I thought that was the way to get the big trout into the well."

A murmur of applause from several voices follows my closing of the manuscript, for the whole of the fishermen had quietly followed Ned into the room, and thus swelled the number of my audience. Carrot, who had partly recovered himself by this time, swore that every word of it was truth. That it was not a dream, and that the Devil had more to do with fish than people supposed. For my part, I said, that it had occurred to me while reading the narrative that I had heard it somewhere before, and that it was not new—perhaps copied out of some book, now out of print or forgotten. But the majority of my audience declared that it sounded brand-new, and there was nothing stale about it, so that I had to content myself with the unanimous opinion of the fishermen that, whether it was of the musty past or the blooming present, it was a devilish good story.

THE CULTURE OF CARP AND CONSTRUCTION OF PONDS.

BY RUDOLPH HESSEL.

PART II.—CONTINUED.

I NOW proceed to give a few rules of general importance for the construction and management of carp-ponds.

The ponds should have as shallow a border as possible. Their depth should be in accordance with their size, one foot in the culture or regular carp-ponds where large fishes are kept; one-half foot in breeding, and one-quarter to one-half foot in hatching ponds. The borders should be of considerable width; it is desirable in any case that a great number of such shallows be contrived in ponds, as these are the principal feeding places of the carp.

Another important condition to be considered is this, that the water in ponds must be of the same depth all the year round, any variation in this having an injurious influence upon the fishes.

Ponds of smaller circumference, of from ten to fifteen acres, are, according to results obtained, better suited for carp-culture than very large ones, 100 to 1000 acres in extent. These are frequently found in Central Europe upon tracts of land belonging to some princely domain. In the former the fish finds more security, the bottom of the pond being smoother: it also suffers less from the waves, these being high and rough in large ponds, becoming very detrimental to the spawn and breeding fishes, especially during storms, when they are cast ashore and become the prey of water-fowls or perish in some other manner.

The diminution of water by evaporation must be made up for by a fresh supply; this, however, must not exceed the quantity actually needed for maintenance of the regular height of water. Small ponds of from one to fifty acres area, which serve some commercial or industrial purpose, as mills, etc., and which are constantly varying the height of their water, cannot be considered

as favourable or regular culture-ponds. Although the fishes may grow to a pretty good size in them, they must still be regarded as belonging to the category of waters for "free fishing," like lakes and rivers. In these neither the height of water, nor the hatching of the eggs, nor yet the increase of aquatic animals can be regulated at will. Still, leaving these waters to lie waste on this account would be a pity, for if stocked with carp they will, in spite of all disadvantages remunerate the proprietor, and the care which he bestows on them will be a source of much pleasure.

I beg to make some remarks, in conclusion, relative to the introduction of the carp and its increase in open waters, in which it is solely left to the care of nature, and to which subject I alluded at the commencement.

We introduce into our waters migrating fishes, such as the salmon and shad, and find it profitable for the reason that they consume but little food in the rivers, growing up in the sea and ascending into fresh water as large fishes. We also maintain in our lakes white-fish, bass, pike, &c. These are all fond of animal food and belong, in part, to the class of fishes of prey. The carp, on the contrary, lives upon vegetable food, insects, larvæ, and worms, but it never attacks other fishes or their spawn. It can be produced in masses and then be transferred into the waters destined for its reception. This can be done either by artificial impregnation and hatching, or in the way of natural increase.

For each of these methods two ways of action are open: (1) The spawn can be transferred into open water as soon as it is free from the egg; or, (2) the young fishes may be kept in ponds for a season until they have had time to grow—that is, for one summer. In the latter case, the rule, that fishes which are destined for open waters must not be artificially fed, is to be strictly adhered to. Carps which have been used to feeding in that manner will not be so apt to find the food for themselves which, until then, had been supplied to them. Tormented by hunger, they will lose the fear of their enemies and the consequent cautiousness, falling an easy prey to them before many weeks will have elapsed.

If artificial feeding is not intended, the ponds for the reception of the small fishes must be proportionately larger, so that they may find food in sufficient quantities in a natural way. Both methods have their advantages. If the young fry is transferred into open water five or six days after hatching, there will be no necessity for the establishing of large ponds. A great number of eggs must, however, be hatched in this case, for the small fishes will be destroyed in vast numbers by their enemies.

The better method of the two is certainly this: To keep the young fishes in large ponds until the autumn, when they will have reached the age of five or six months. During this time they will have had the opportunity to learn how to find their food by their own efforts, such ponds producing it profusely to satisfy all their wants, and thus they will be prepared for their stay in open waters. To carry through the latter method, a larger extent of water is required, nature itself having indicated precisely the conditions under which and the limits in which the natural and unimpaired growth of the young fishes may be expected.

They do not require as extensive a pond during the first months of their development and growth as those which have reached a more advanced age. For this reason it will be more advantageous to choose the middle way by retaining the young fishes in the ponds for about one or two months and then to give them their liberty instead of transferring them immediately after the hatching, or keeping them for five or six months. By acting upon this suggestion, the incalculable advantage will be gained that the fishes profit by the rich food of the open waters during the season, and will have grown strong enough to fight more

successfully for their existence. For this purpose, establishments for artificial breeding, constructed with a regard to the demands of climate, are essentially needful in these open waters, so that the greatest possible number of eggs may be hatched.

In Europe the subject of stocking open waters with the carp has been discussed, because there, in its native country, its excellent adaptation for this purpose has been recognised.

I observed above that this fish is found in great numbers in most of the European rivers, particularly in the Rhine. Although this river has a very swift current, which at times forms rapids, here neither mud nor suitable ground is to be found which would qualify these localities for feeding places for the rather indolent carp; still, there are numbers of shallows and small creeks, the borders of which are richly overgrown with grass and *Festuca fluitans*, where the fishes find food plentiful and multiply.

The river carp is not as fleshy as the pond-carp; this is accounted for by the great amount of bodily exercise which it is naturally compelled to take. In many places it is more highly appreciated than the pond-carp, probably because the river water does not impart to it the mouldy taste which is sometimes found with the carp inhabiting ponds situated in marshy localities and morasses which have not a sufficient supply of fresh water.

The assertion in regard to the preference given to the river-carp will be found to be correct, especially in regard to the rivers Rhine, Elbe, Weser, Vistula, Loire, Rhone, Garonne, and the Danube. The latter is celebrated in song as the beautiful blue Danube; in reality its water has, during the greater part of the year, a greyish-white, muddy colour, and a very swift current. It has, however, particularly in Austria, Hungary, and the lowlands in general, which border upon it, numerous branches which creep along sluggishly, and also many small creeks with almost stagnant water.

A great number of fishes of prey inhabit this river; the pike, perch, the rapacious Hucho (*Salmo hucho*), and, above all, the never-satisfied Wels (*Silurus glanis*), which, in the lower Danube, reaches a weight of 500 pounds. Its habits being similar to those of the carp, it lies on the mud-banks or feeding-places of this fish and becomes its most dangerous enemy, and insatiable destroyer, and still the carp increases in the Danube. From the city of Ulm, where the river begins to be navigable, after its escape from the Black Forest, a thousand miles downward to its mouth on the Black Sea, as also in this one, the carp is found. To this fact allusion has been made on a former occasion. The carp thrives best in those parts of the Danube where the water is the least clear, at the influx of the muddy waters of its tributaries. At one time I was present at a draught of a seine which took place close to the quay of the city of Pesth, in Hungary, and was arranged by Mr. Szihelsky Ferentez. At that point the river is constantly ploughed by steamers, steam-tugs, canal and ferry boats, and it would have seemed that there could not be many fishes there, yet 300 fine carps, weighing from one to five pounds each, were taken in one draught of the net, within the distance of about one-quarter of an English mile. The carp is partial to this locality because it finds abundant food there in the offal from kitchens, slaughter-houses, breweries, and the sewers of both the cities of Ofen and Pesth. In the European lakes, for instance in the lakes of Constance, Zurich, and Geneva, the carp comes sometimes from these into the ports to seek for food.

PART III.

5.—TAKING THE FISH FROM THE PONDS.

The emptying out of ponds demands the greatest caution and attention. The water must be made to flow off very gradually through the several outlets, all of which are to be kept open at the

same time; it requires frequently from ten to eighteen days to draw off the water. The fishes are driven carefully and slowly with boats into the principal ditches. They must not be chased on any account, or they will bury themselves in the mud; occasionally many thousands will do so within a few moments, and will remain there, pressed together closely, and so perish through suffocation. This is recorded as having occurred from time to time, when, during the process of driving them into the ditches, the fishes were startled by some unknown cause, and all sank into the mud instantaneously. Through the impossibility of extricating them speedily enough, many hundreds and even thousands perished, the owner sustaining heavy losses in consequence. To guard against such an emergency, preparations should be made for an immediate supply of water in similar cases, in order to save the fishes. If the fishing-out progresses in the regular manner, the fishes will by degrees, draw off from the ditches into the collector. The collecting takes from five to six days in large ponds, containing frequently 100 to 400 tons of fishes. Care should be taken that crowding them together may be avoided. On the evening before the fishing-out, when the water of the pond has been diminished to the depth of half a foot, those fishes which have been collected are shut off from the pond by a large net, and in the early morning, at the dawn of day, they are caught. As so large a number of fishes cannot be disposed of at once, they are transferred to the so-called market ponds, from which they are sold by degrees to fish dealers. These market-ponds are quite small, capable of holding from 2000 to 3000 pounds of fish only, and are supplied with running water.

(To be continued.)

A TRAVELLER'S TALE.

WHILST on an angling excursion a few days since, on slipping into a railway carriage on the L. and S.-W. line, I was accosted by a stranger, the only other occupant of the compartment, with "Going a-fishing, sir?" On my replying in the affirmative, he informed me that he was also on the same errand bound. No further introduction was necessary, and we were soon chatting over our varied experiences in angling. As we were nearing a country station, he called my attention to the river over which we were passing. "Look," he said, "at that pool under the alder bushes yonder. One of the best day's fishing I ever had was there. And now, do you see that old grey church tower some three miles distant? The same evening, in a house close by that tower, I spent the most awful night of my life." Hearing this much my curiosity was excited, and I begged him to tell me all about it, and, as the train sped on, he related to me the following remarkable story:—

"'Tis many years ago," he began. "I was a young fellow then, about twenty. I was articled to a solicitor in London, and had received an invitation to spend my Christmas with a friend living within fifty yards of the old tower I just now pointed out to you; and early on the morning of the 24th December I was snugly ensconced in a railway carriage with my portmanteau and fishing-rod, rushing along at the rate of forty miles an hour towards the station we have just left. On my arrival there I was met by my friend, who had previously made arrangements to spend the remainder of the day fishing in the stream close at hand. We had excellent sport, killing several dozen fine roach and dace. We then walked to the inn, got our horse and trap, and rattled merrily away to my friend's house. After the little formalities of introduction to the family had been gone through, I was shown to my room to dress and make myself presentable for dinner. It was a curious old room, in fact, it was a curious old house altogether. It was an old ecclesiastical building adjoining the parish churchyard, and

had a sombre, monkish appearance about it. I did not notice all this then, as my thoughts ran more upon the coming meal, for I was pretty sharp set, having had but a light luncheon since 8 a.m. Well, the dinner was a very good one, and duly disposed of, and a jolly evening spent in a manner usual at this season of the year, and we retired to rest at what a Londoner would consider an early hour. I was tired and sleepy from my journey and unusual exposure in the open air, and was quickly between the sheets. I had been asleep some time, I cannot say how long, when I was awoken by a strange noise. I thought I must have been dreaming. But no! There it was again!—a long, low, muffled wail—as if some creature was in dire distress. Then a hammering and beating within the wall of my room. I sprang up in my bed and listened. There, close by, was the same low wail—half sob, half cry—and the same hammering within the wall. Then an undefined terror possessed me. A cold, shivering sensation ran through my whole frame. I tried to call out, but my tongue clove to my mouth. I could not utter a sound or move a limb. I was not naturally superstitious, and I strove again and again to brace up my nerves and get up and try to discover the origin of these ghostly sounds, for they still continued; but an overwhelming sense of dread overpowered me, and I sank back in my bed in a swoon. When I awoke it was morning, and as I looked out of my window on the well-kept garden and the little fish-pond shimmering in the December sunshine, I tried to persuade myself that it was all a dream, conjured up by my having partaken too freely overnight of the Christmas fare. But it was no good. I could not shake off that indescribable feeling of dread, and I determined that I would not sleep another night in that room. On joining the family at breakfast my haggard looks were noticed by all, and elicited inquiries as to how I had passed the night. I told them that I would not sleep another night in that room if I was to be made Lord Mayor of London for doing so; and I stated what I heard and felt—*felt*, mind you—it was the feeling more than the sounds. I had heard all sorts of strange noises before caused by cats, rats, and other nocturnal disturbers, and cared not a straw for it, but it was the feeling that you were in the presence of something mysterious and indefinite. It was horrible. Then they told me that there was an old legend that in that room, centuries ago, a monk had been walled up in his cell for breaking his vows; and that ever after sounds similar to those I have described had been heard, which no one had been able to explain. Neither could I—"

The shrill whistle of the engine here warned me that we were approaching the station where I was to alight, so, thanking my new acquaintance for his narrative, and wishing him good sport and a merry Christmas, I bade him good-bye, and proceeded to the river, to enjoy the sport of which I had come in quest; but many times after, during that day, my thoughts would revert to the story of the monk walled up in the old chantry-house.

RED ANT.

GREGORY'S SPINNING BAITS.—"The Gregory," the "Flexible Cleopatra," the "Oxford," and the "Colorado," pronounced by all Anglers and the Press the best baits invented for salmon, trout, pike, and perch. To be obtained from all respectable fishing-tackle shops in the world, and wholesale from Messrs. S. Allcock and Co., Standard Works, Redditch. Flattering testimonials speaking of the efficiency of the baits have been received from the Right Hon. John Bright, M.P.; Mr. William Bailey, Nottingham; the Rev. E. C. Holt, Teddington; Sir William Calder, Kingston-on-Thames, &c. Gregory's registered Archimedeal spinning tackle for pike and trout, now ready, is pronounced by the press the best ever invented. For use with dead bait. The tackle is complete in every respect, and can be adjusted to suit bait of any size. Has been tried with remarkable success.—See that the name "Gregory" is impressed on the Archimedeal fins, as inferior imitations are offered for sale, and people are thereby disappointed and deceived. Address, James Gregory, Vyse-street, Birmingham.—[ADVT.]

TO ANGLERS.—W. J. Cummins, Fishing Tackle Maker, Bishop Auckland, is now prepared to forward to anglers his Illustrated Catalogue, which is not only a Trade List but is interspersed with practical hints, useful directions, and valuable information gathered by the river-side from twenty years' experience. The stock consists of his unrivalled Salmon, Trout, Grayling, and Pike Rods, Lines, Reels, Baskets, Artificial Baits, Fly-books, Landing Nets, Gaffs, and last, but not least, his celebrated Trout FLIES, which for killing powers stand unequalled. Every article kept in stock is of the very best description.—[ADVT.]

GEORGE JAMES EATON, of Starkholmes Matlock-Bath, Derbyshire, respectfully invites Noblemen and Gentlemen to try his standard FLIES for the present season. No flies sent or made up but what he himself has proved sure killers. A trial is all that is required from gentlemen who can fish to prove whether they may be genuine or not. Patronised by some of the best fishermen of the day. All flies dressed on the best Kendal books. Prices: Point Flies, 2s. 6d. per Dozen; Dropper Flies, 2s. per Dozen. Orders punctually attended to.—[ADVT.]

RIVER REPORTS

MID-THAMES.

"Our business is this State
Made me a hook-on."—SHAKESPEARE.

Very little business has been done in this state during the Christmas holidays, in consequence of the bad state of the river, and from the present plethoric condition very little will be attempted or done for days to come. At Henley some pretty catches of roach and perch have been had from the bank, but the enthusiastic gentlemen have had to sit, as a rule, up to their knees in liquor uncongenial in their tastes. At Henley the Rev. Harrison, a well-known and respected member of a London club on Tuesday got hold of a tench of 4 lb. Messrs. Crumpton and Harding in the same district, fishing from that "honest ale house," the East Arms, got in two days 1½ dozen roach—best-going 1½ lb, and some 1 lb. confreres, also perch of 1 lb. each, and one beauty 2½ lb., which is to be preserved à la Madame Rachel and made thing of beauty and a joy for ever in the piscatorial den of the above said gentlemen. River out of all trim—pulse high—tongue furred—febrile indications—useless for visitors to call.—MARLOW BUZZ.

Thames (Goring).

Water thick, and a flood. A lot of snow here to-day; no fishing for some time to come. Prospects look bad unless we have some frost to get the water clear. No one has been out here all the Christmas.—J. RUSH.

Thames Twickenham).

I am sorry to say the river is quite out of all question for angling, and is likely to be so for some days to come. I have had four punts out since Sunday and each punt only taking a few dozen roach and dace. Monday and Tuesday would have been quite busy days with us had it not been that I had to advise several of my clients to postpone their visits until the river gets itself again. As I have before advised this is the advantage of writing in advance. River overflowing, wind N.W. Freezing hard.—A. PERRIN, reporter.

Thames (Windsor).

"Water, water everywhere! and certainly none fit to drink," is the cry. The towpaths are submerged and every watercourse full and the colour of soup. and things could not be looking more miserable; in addition a nice lot of snow fell last night, so that things are very cheering for Thames anglers. I managed to get a few roach with the ledger last Thursday, best fish 1 lb. 1½ oz., but beyond this I know of nothing. Prospects are very bad. In the report of chub 4 lb. 8½ oz. taken by me, in last week's FISHING GAZETTE, it should have been ½ oz. less than the heaviest chub weighed-in to the Windsor Club, not 5 oz. as printed.—B. R. BAMBRIDGE.

Exe. and Canal (Exeter).

The river is now in a very swollen state, and will not be in angling condition for some few days. We have had a great deal of rain, but this afternoon a change has set in, with every appearance of a hard frost. In the back-water at Cowley Bridge a few pike have been caught, but nothing special has come under my notice. I hear that some nice pike were creel'd by some Bristol gentlemen on Bank Holiday in the Tiverton Canal, and Mr. Kelley on Tuesday landed four pike, the largest, a very fine one, scaling 14 lb. It was taken with a live gudgeon, and was in excellent condition. All information as to tickets, &c., can be obtained from Mr. Parkhouse, landlord of the Railway Inn, Halburton, where every comfort and civility will be found. It is not quite two miles from Tiverton Junction Station, on the Great Western Railway. I may add the canal abounds with large pike, carp, eels, tench, and perch.—J. A. K.

Ouse and Ivel (Blunham).

These rivers, unfortunately, have been very much flooded this week and have been a great disappointment to the London anglers. Messrs. Patching, Sargeant, and Collier were fortunate enough to take some very fine roach. Mr. Sargeant took one weighing 1 lb. 9 oz. Should the rain keep off, the rivers will be in good condition by Monday next.—T. ELLIOTT.

Trent (Nottingham).

The weather on Monday (Bank Holiday) was so contrary for rod-fishing that many of the anglers would not venture out, though the water was in fair condition for the use of worms; there were several inches of snow on the ground, which seemed to make things worse, but some of the rodders would not be stopped, for it appeared that they knew this one fact, that is, so long as the snow remains on the ground, it does not affect the fish much from biting, and, with careful treatment as to the use of groundbait, I have frequently known roach to bite well at the cockspur worm—and this some of the fishermen who went out seemed to understand, and the result was that some nice roach were caught by those who ventured out, and were shown at the different clubs, to the surprise of some of their friends, who guessed the fish had been netted, "Nothing of the sort," said one of the successful anglers; "all have been hooked, and nothing used but worms for bait." After the time stated above, the snow went rapidly away, accompanied with rain, and quickly put rod-fishing out of the question. The river began to rise rapidly, and at the time of writing is

quite in a flooded state, so that there will be chance of sport for several days to come.—W. BAILEY.

Trent (Newark).

Fishing in the Trent this Christmas has been a miserable failure (for you may perhaps recollect that when I sent off my last note the river was in high flood), and on Christmas-day and Sunday the adjoining land was submerged, presenting to sportsmen a very dreary prospect. On Monday and Tuesday the water rapidly went down; but the foundation of another very heavy flood was laid on Sunday night or Monday morning, for on that morning snow laid on the ground to a considerable depth. On Tuesday a few anglers, taking advantage of the improved state of the water, succeeded in getting a few dace with worm but towards two o'clock in the afternoon, the snow just mentioned, which had been all Monday rapidly melting, got into the river and caused the water to rise again, with a very nasty colour; and then, to make matters worse, it rained very heavily nearly the whole of Wednesday, and so to-night (Thursday) the river is in high flood, and the adjacent land again submerged—making no less than fifteen heavy floods that have swept down the Trent in the year 1880: truly a terrible total. So there will be no fishing here for a few days; but I hope that your readers may, in the coming year, have a glorious season, and in the meantime I wish all friends a Happy New Year, from the Editor down to your humble servant.—THE TRENT OTTER.

Wye and Derwent (Derbyshire).

Both rivers have large floods on them at the present time. There will be no fishing with rod and line for another week or ten days. The cleach net party have killed a few fish during the flood; they complain very much about the scarcity of fish in the Derwent.—GEORGE JAMES EATON.

The Yore (Yorkshire).

It has been a custom with me for a great number of years to have a good day's grayling fishing on the day following Christmas Day, and only twice during that period have I been disappointed, for so long as the river is in proper order and free from snow water I care very little for what some people term the discomforts of the weather. This year, however, although the day itself was all that could be desired, the river was so swollen with the heavy rains that fell during the earlier portion of the week that fishing of any kind was out of the question. In the evening another thaw set in, so that I expect it will be another ten days or a fortnight before our local hands will have a chance with the grayling. I note in last week's issue that a correspondent asks for information respecting the Wharfe. If he thinks it worth while to send me a letter, through the editor, stating on what points he requires information, I shall be most happy to reply to it, as nothing gives me greater pleasure than to render assistance when I am able to a brother angler, and I am not aware of any books treating solely on the Yorkshire rivers, excepting Jackson's "Practical Fly Fisher," and Michael Theakstone's "Flies found in the Streams about Ripon," both of which, I believe, are now unobtainable.

FRANCIS M. WALBRAN.

FROM "PUNCH'S ALMANAC FOR 1881."

PHYSICAL (GEOGRAPHY.—English Angler (on this side of the Tweed, fast in a rock on the other): "Hi, Donald! come over and help me to land him—a 20-pounder, I'll swear—" Highlander (on the other): "It will tak' ye a lang time to lan' that fush too, d'ye ken, sir, whatever!—Ye hae heuket the Kingdom o' Auld Scotland!"

CULTURE. 1881.—Mistress: "As you've never been in service, I'm afraid I can't engage you without a 'character.'" Young Person: "I have three School-Board Certificates, Ma'am—" Mistress: "Oh, well—I suppose for Honesty, Cleanliness—" Young Person, "No, ma'am—for 'Literature,' Joggr'phy, an' Free 'And Drawin'!"

A CHOICE BIT OF ENGLISH.—The English language is no doubt a very difficult one to learn, and it is a marvel that foreigners ever learn it all; but they do—the Germans especially—and the use they make of it afterwards is sometimes truly remarkable. The proprietor of a mineral spring at Carlsbad knows some English, and he writes what he knows with a fluent ease and freshness which cannot be too much admired. The following specimen of his literary skill—an advertisement copied from one of his bottles—seemed to possess, as it were, some of the sparkle of the mineral waters themselves:—"Warning. Only the above mentioned packet up is the very pure salt of the Sprudel because it is produced by the inspection of the town officers. But that salt packet up in wooden boxes, and also trading with that is false and counterfeit; and it is our duty to let this be a warning to the gentlemen and ladies to buy it."—From the "Editor's Drawer" in *Harper's Magazine* for December.

EXTRAORDINARY "RUN" OF SALMON IN THE TEES.—During the late floods a large number of salmon have passed into the Tees and its tributaries from the ocean, on their way to the spawning beds. Many of the fish were of prodigious size and weight, and certainly the number has never previously been exceeded. The Greta literally swarms with salmon and its species, many of the larger fish being unable, now that the flood has somewhat subsided, to surmount the obstacles which are so frequent and formidable in the course of that river. Thousands of salmon have made their way to the higher reaches of the Tees, and a more favourable season for "running" it would be impossible to imagine, as, for several successive days, not only has the Tees, but the whole of runners in the neighbourhood been full. If the number of fish is any criterion as to the Tees being a good salmon river, there can be little doubt that that river now stands in the foreground of northern English spawning beds.—*Middlesborough Daily Exchange*.

THE PRACTICAL VALUE OF FISH CULTURE.—A year or two ago the Americans introduced carp from Germany into many of their waters with a view to cultivate them. Here is an instance of their success and the American papers have such account, frequently from all parts of the Union. This is from the *American Fishing Gazette*:—"CARP CULTURE.—Mr. C. Newell, one of the proprietors of a Sonoma (Cal.) carp pond, says in regard to the carp, 'The fish are almost boneless. Breeders commands 4s. each; market fish, 1s. per pound, and that 6d. is a profitable rate, Major Sullivan is now realizing £800 a year off a small pond. The Grant Pond has a capacity of 9,000 gallons of fresh water per day. In June last forty-two breeders (three males to one female) were put in; the eighteen females ought to have spawned 1000 each, and next year arrangements will be made to accommodate 100,000 fish. Northern Sonoma abounds in springs that would render carp ponds possible by the hundreds. Why not, then, experiment?'"

THE DAY BEFORE CHRISTMAS DAY.

PRACTICALLY, as regards fishing, Christmas Day has been a blank, but perhaps the season has been made up in the best of prizes, a happy Christmas home! There are those undoubtedly who would have spent their Christmas in fishing probably to the regret of their wives and families, have now been able to spend it at their own fireside. A husband and a father is in his proper place, on Christmas Day, at least, at the head of his own table; and if he had the chance as I had—thanks to a good friend for it—to partake of a splendid turkey, he must have felt unusually comfortable on this particular Christmastide, and he would have no cause to regret his absence from the Thames, as there was no possibility of his enjoying his favourite pastime of angling. On the day before Christmas Day I visited the neighbourhood of Staines, Chertsey and Weybridge. At the former place I first caught sight of the Thames, and found it in a frightfully flooded condition and looking as bilious as possible. On interrogation with some of the professional fishermen after the morning salutation, and receiving the seasonable good wishes, came the dreadful exclamation, “No more fishing this year!” I tried to cheer them up by reminding them of former instances when a few days put the river right again, but there was still the desponding look with the response, “As you say so, I’m bound to believe you, but at the same time I have my doubts.” I left them trusting that my words would come true, and that I had rightly indulged in a reasonable hope. At Chertsey the river was running like a mill stream, and the fishermen with no expectation of employment during the Christmas holidays. The future appeared to them full of gloom as concerns fishing. The veteran William Galloway, now ripened into a good old age, was looking remarkably well; and James Haslett, instead of devoting his energies to his angling clients, would have to discharge the duties of “mine host” at the Woburn Arms, Addlestone Moor, of which he is the piscatorial landlord, in addition to his business as a professional fisherman. I never go to Chertsey without bringing back with me some of Mr. Ashby’s famous sausages, and they were particularly wanted then for the turkey which I have before referred to. These sausages possess one special recommendation as of the good old sort of home-made ones seasoned with sage. I need not say much of Weybridge, as the river there possessed the same character as at Chertsey and Staines, but I cannot help referring to a comfortable few minutes’ rest at the Lincoln Arms, where I found Mrs. Harris and her son as genial and as pleasant as ever. It was now time for me to wend my way to the Weybridge station for the purpose of discharging a sorrowful mission in paying my last respects to the late Frank Buckland. I took the express train to Waterloo, and thence by the District Railway to Earl’s Court, which is only five minutes’ walk to the Brompton Cemetery, where his remains were to be finally deposited. I arrived there about a quarter of an hour before the time fixed for the funeral, and precisely at the hour of one o’clock the solemn procession, headed by a band of surpliced choristers, came on the grounds and silently marched to the earthy grave. It was a sorrowing spectacle to see the dear old friends and associates of the late Frank Buckland gathered around his last resting-place in this world, and though I should fail to enumerate their names, I will mention those that I can remember. Close to the grave was his valued friend, Mr. Henry Lee, mourning over the loss of one to whom he possessed in life the love of a brother; but I need not depict the feelings of others, as all felt to share in the same grief. The Piscatorial Society had a long train of members, amongst whom were Messrs. T. R. Sachs (a very dear friend of the late Frank Buckland), James Pattison, F. G. Pearce, David Goodger, B. Perelli-Rocco, T. Huggett, Dr. Coates, J. A. Nicholay, M. S.

Nathan, James Lander (Honorary Secretary), &c., &c. The Thames Angling Preservation Society, of which the late Frank Buckland was a vice-President, was represented by Messrs. T. Spreckley (Chairman), W. H. Brougham (Secretary), H. L. Rolfe, Alfred Jardine, and H. P. Eyre (members of the Committee and also members of the Piscatorial Society). Several other angling clubs had also their representatives. The Hon. Captain Ellis was present as the representative of Prince Christian; Mr. Bartlett, of “the Zoo”; Mr. Henry Ffennell (the son of the late Mr. W. J. Ffennell, a former Inspector of Salmon Fisheries), a fellow-worker with the late Mr. Buckland on the staff of *Land and Water*. Amongst the large group of mourners I noticed Mr. E. W. Searle, Mr. Buckland’s valued private secretary, and Mr. R. Edon, who had charge of his Economic Museum of Fish Culture at the South Kensington Museum, both of whom appeared to feel deeply their irreparable loss. At the conclusion of the funeral service the surpliced choir sang three hymns and the evening chant of “Lord now lettest Thou thy servant depart in peace,” and the usual benediction ended the mournful ceremony. I have had the pleasure of about twenty years’ friendship with the late Frank Buckland, and amongst my most recent pleasurable reminiscences were a few days in Yarmouth, about two years ago, at the time of the meeting at Lowestoft on the Acclimatisation of Fish, when he requested me to devote my whole time with him, and there were also two other good friends, Mr. T. R. Sachs and Mr. Bartlett; and the last time when I saw him some few months ago in Albany Street, where he sent for me to come and see him, his last words were those at the door of his residence, “I want you to come and spend an evening with me, and as soon as I can I will let you know.” But the time never did come, as his health gradually became worse; there was another journey pressing onward before him, one on which we are all travelling, and sooner or later we shall all come to the end of it like our good old friend Frank Buckland! Thus (out of my own family) ended “the day before Christmas Day.” It commenced with a gloomy view of the river, and it ended in the sorrowing interment of an old friend. I am not going to despond, for with the one there was to me the prospect of an improvement, and with the other the good and wholesome hope that “He was not lost, but gone before.” The same sun which shed its rays so cheerfully at such a time over the grave, shone again on the morrow (Christmas Day) with greater brilliancy and hope, illuminating one’s thoughts in even higher aspirations, and as I am writing this on Christmas morn with the text on the wall of “Glory to God in the highest,” I may close with a fervent hope that in both cases it is typical of a glorious future, and in wishing those who still remain a truly “Happy and Prosperous New Year!”

B.

NOTICE TO SUBSCRIBERS.

WE shall be much obliged if our subscribers will send their subscriptions for the coming year at once, to save unnecessary correspondence. All postal subscriptions are due in advance.

THE NATIONAL FISHERIES EXHIBITION.

WE beg to call the special attention of our readers to the long list of subjects and exhibits for which large money prizes and gold and silver and bronze medals will be awarded. It will be noticed that the Exhibition has the direct support of Government.

Mrs. F. Y. BROCAS, Artificial Fly Dresser, 4, Mill-street, Conduit-street, Hanover-square, London, W. A stock of best flies always on hand. Flies made to pattern. Lessors in fly making given.—[ADVT.]

"A WINTER'S TALE."

AT this time of year the trout-fisher naturally yearns after tales and memories of bygone happy hours spent by his favourite stream, and any sketch that may conjure up the old scenes is welcome. Let this be my excuse for the following account of a few episodes in the career of a young angler, though an old sportsman.

It is only two seasons ago that my sporting tastes, denied the use of gun and dog, as in the old prosperous times, perforce turned themselves to the less expensive rod.

About Easter, 1878, fitted up with the usual bran-new tackle of a beginner, I set off to a subscription water, and taking with me a professional fisherman as guide for the first day, I tried to throw a fly. The guide was most kind; he showed me every likely place, and lest I might not be successful, he always fished them first and when he had caught a fish and otherwise disturbed the water he left me to finish fishing while he went on to "spot a fish for me." The result of his "spotting" was a full basket for him, not a fish for me, while I was minus his day's wage and exs. The next day I went alone, but did nothing. The third day there was a lot of fish killed, but while the rise was on I sat on the bank and lunched; when the rise was over I began to fish in great expectation and excitement. With consummate skill I described a horseshoe curve with my right arm round my head, carefully avoiding any wrist action or jerk that would endanger my 2d. flies; then launching forward my body, arm and rod, I got out a fair length of line which, with plenty of slack, floated down stream towards me. I would premise that, being full of book-lore, I was of course an up-stream fisherman. Now a long whippy rod and about ten yards of line require more management than I then knew of; consequently, when a fish did come, he had time to spit out the fly before I could get my stroke through the slack line. And when the stroke had reached the end of the cast, the fly could dash off somewhere behind my head, and get hung up ten minutes after the trout had left. Despairing at length of learning to fish by the aid of books and my own genius, I sought an old fisherman, and craved his counsel.

Said he, "Put a piece of paper on a pond, and whip at it till you hit it every time." Selecting an envelope of decent size, I practised diligently with fair success, and at length got into the "way of it," as my old friend said. An opportunity soon occurred of putting my skill into practice, which was rather amusing, and to me, of course, most novel.

I had an afternoon on some private water which swarmed with trout, and where I hoped to flesh my maiden rod and flies in something better than sodden bits of paper; so, full of hope, I stood on the banks of the fateful pool, and geared up my tackle, my wife being an admiring onlooker. Just as I had finished, a water-rat started from under our feet, and swam straight for the opposite bank. Here was a chance to show my skill! Once, twice, my hand trembling from eagerness, threw over, but beyond him; the third time I struck him in the hind leg. Promptly he curled round on the top of the water and endeavoured to free himself from his disagreeable attaché; the strain I put on him, however, in accordance with my instructions "When Playing a Fish," was too great. He dived a deep long dive; then suddenly coming to the surface he headed for my bank, giving me a lot of slack to reel up, while the wife stood net in hand determined to do or die. The rat, however, objecting to the latter alternative as far as he himself was concerned, set off again across the pool, plunging about in a way that quite astounded me; these exertions told on him though, and the wife cleverly scooped him out in my brand-new net. When he was landed the question of his disposal became unpleasantly urgent; he began to bite the net, and finally seeking refuge under the petticoats he saw so near him, so alarmed

his fair captor that she incontinently fled, in so doing breaking the cast in about three places. The writer, anxious not to hurt the rat by rough handling, and also mindful of his fingers, sought diligently for a stick.

But the rat, impatient of delay, and finding his chain loose, hastened to the shores of his beloved home, and with a bold header leapt into the pool, thus gaining his well-earned liberty. Thus my first fish was a rat, and the experience so got broke the spell of my ill luck, for that afternoon five nice trout, one of which weighed over half a pound, and took me fifteen minutes to land, during which time I lived a little life of hopes and fears, going through emotions which not even my first grouse-drive could raise.

COTTON SPINNER.

THE RIGHTS OF ANGLERS ON THE THAMES.

AT the Coleman Street wardmote meeting on Tuesday, the Lord Mayor presiding, a question of considerable importance to anglers on the river Thames was mooted. Mr. J. F. Clarke proposed the following resolution: That this wardmote is of opinion that the interference by riparian owners on the banks of the Thames with the rights of angling enjoyed by the public for so many years is a subject well worthy of the attention of the Corporation of London, as a staunch defender of public rights." As an old fisherman, he had very great pleasure in introducing the subject to the consideration of that important meeting, with the hope that the Court of Common Council would take some action in the matter. The interest and pleasure he took in piscatorial pursuits had no doubt often left him open to the charge of being stupid, but he did not care much about such accusations so long as he derived pleasure and amusement from his favourite pastime, although he regretted to say that he very frequently came back from the banks of the river or stream in which he fished with a light hamper. (A laugh.) The encroachments which of late had been gradually made upon the rights and privileges of anglers should be sternly resisted, and he trusted that the representatives of that ward in the Court of Common Council would do all in their power to maintain those rights and prerogatives intact, and that the Corporation would thus uphold its ancient and well-deserved claim to being a staunch defender of public rights whenever they were assailed. (Hear, hear.) He need scarcely say that if his lordship, as the alderman of the ward, with the Deputy and their worthy colleagues, the Common Councilmen, interested themselves in the question, and submitted it for the consideration of the Corporation, they would be conferring a very great benefit on a large and important section of the community, and they would earn the sincere thanks of all Thames-side anglers. He had much satisfaction in proposing the resolution which had been read to them by the ward clerk.

Capt. Alfred, as a member of the Thames Angling Preservation Society, and an old fisherman on the Thames, seconded the motion with great pleasure. Although not very old in years, he thought he was justified in calling himself an old fisherman, having plied "the gentle art" on the Thames for upwards of thirty years. He regretted to say that the interference with the rights of anglers, of which they had just cause to complain, was gradually and steadily growing, and it had now increased to such proportions that if energetic action were not speedily taken by some public body, as the Corporation, the privileges hitherto enjoyed by fishermen would be completely gone. Anybody who thought proper to purchase a small field, or build a villa on the banks of the river, claimed the right of preventing persons from fishing in front of his place. Under these circumstances he had no doubt that their right honourable friend the Lord Mayor, as the chairman of the Thames Conservancy, would exercise his influence with that body and the Corporation to stop any further

encroachments on the prerogatives of fishermen on the Thames. So great had become this evil, and so strong the feeling of indignation in the angling world, that a committee of gentlemen, known as the Thames Angling Rights Committee, had been formed, with a well-known disciple of the art who was connected with *The Field* newspaper at their head, to look after the interests of anglers in this respect, and see that no more serious wrong was done to them. Up Thames much difficulty and inconvenience were experienced in consequence of the attempts made by these small proprietors to enforce what they considered as their rights, but which were nothing of the sort, as against the public. Up to Staines fishing was not hampered with these restrictions, but beyond that point of the river he regretted to say every obstacle was thrown in the way of anglers. He therefore hoped the Corporation, in the interests of the public, whose rights and privileges were now attacked, would step in and prevent the continuance or recurrence of this state of things. The Corporation had long deserved the name of being staunch defenders of the public rights, and he trusted they would now prove true to that high character, and win the approval and thanks of Thames-side anglers by a bold and resolute effort to maintain the privileges which they so long enjoyed, but were now most unfairly interfered with.

The motion was put to the meeting and carried, the Lord Mayor promising to do all in his power to carry out the wishes of the mover and seconder of the resolution.—*The Field*.

Similar resolutions were proposed in the wards to which they respectively belong by Thomas Spreckley, Esq., President of the T.A.P.S., and F. H. Lemann, Esq., a member of both committees.

SEA-FISHING AT PLYMOUTH.

BY WILLIAM HEARDER.

A DAY'S TRAWLING.

“BILL,” said one of a party of seven, seated one evening in a snug smoking-room; “can’t you give us a day’s trawling?”

“Yes,” was the reply; “next Thursday.” Harry said James would lend his “launch,” and so all was arranged. Bill was to provide trawl, warp, &c., and Harry the grub; whilst the rest looked after the lubricating department.

At ten o’clock we met at the appointed place. A thick, drizzly rain fell incessantly, but nothing would keep us back when our minds were made up. Blowing stiff from S.W., a nice swell was rolling in from the Channel. However, we started.

Bill, with his sea boots and yellow oilskins, which caused much amusement. Harry looked like a modern Robinson Crusoe, or Sindbad; but all were evidently prepared for a wetting. We used a 25-foot otter trawl, and had the first haul inside the “Break.” A few fish was the result—flat fish, pouting, whiting, and some “angels.”

The rain fell incessantly, so kept our landmen below hatches, where, what with the smell of the oil and the hot-water cisterns, they began to feel the peculiar sensation better experienced than described.

Bill planted one of the crew to stop the gangway, but William would insist on his getting out of the way quickly, as he wanted to go “upstairs.”

Lunch was served in the after part, and it was amusing to see the numerous frantic efforts that were made to endeavour to walk. At last, not to be done, they gently sat down and paddled themselves along, not trusting to their feet.

Harry thought that the tobacco I was smoking was vile, and they all agreed that the pie was awfully gross, and recommended

that it should be put aside until we got on shore, where we could sit down and enjoy it quietly.

Just then Will No. 3 was endeavouring to place a tit-bit in his mouth. The boat gave a lurch and it settled in his eye. Bill was determined to have another trawl, so up and off to Cawsand Bay, where some good soles, plaice, &c., fell to our lot. What was most extraordinary was the small portion of animal food that was made use of on board. Even the drinkables were spared.

But Bill never enjoyed a farce more than the day’s trawling.

FUNERAL OF MR. FRANK BUCKLAND.

THE remains of Mr. Frank Buckland were interred on Friday, December 24th, at Brompton Cemetery, in the presence of a numerous assemblage of his friends and admirers. The cortège consisted of ten carriages and an open car, bearing the remains of the deceased in an oak coffin, furnished with silver handles, and an illuminated plate, with the inscription, “Frances Trevelyan Buckland, born December 17th, 1826, died December 19th, 1880.” The departure of the cortège from the residence of the deceased in Albany Street, Regent’s Park, was witnessed by a crowd of sympathising friends and neighbours, who followed the mourners to St. Mary Magdalen, in Munster Square, where Mr. Buckland was in the habit of worshipping, and where a special full choral funeral service was held. The coffin, carried on the shoulders of bearers, and laden with wreaths of choice flowers, was received at the door of the church by the Rev. F. J. Ponsonby (the vicar), and the members of the choir. A procession, headed by the choir, was then formed, and the company proceeded slowly up the nave till the part of the chancel was reached. Here the coffin was laid upon a catafalque, round which the Rev. Canon Liddon, the Rev. F. G. Braithwaite, the Rev. F. J. Ponsonby, and the choir formed a circle, and the service proceeded, the overflowing congregation which had assembled to take part in it testifying to the affectionate interest which was taken in the sad event in the neighbourhood. At the conclusion of the service the coffin was returned to the car, and the cortège proceeded to Brompton Cemetery, where it was awaited by a large number of friends of the deceased. In the first mourning coach were Mrs. Buckland, Mr. Bompas, Mrs. Bompas, (sister of deceased), and the Rev. H. D. Gordon. The second carriage contained Mrs. Gordon, Miss Buckland, Mrs. Bailey, and the Rev. Wm. Buckley. The third carriage was filled by Canon Liddon, Mr. E. Morgan, the Rev. F. G. Braithwaite, Mr. G. Morland, Mr. Bennett, and Mr. Herbert Buckland. In the fourth were the Hon. Captain Eliot, Sir P. C. Owen, Mr. Douglas Murray, and Colonel Bridges. In the fifth carriage were Dr. Ogle, Dr. Wardham, Mr. W. W. Cooper, and Surgeon-Major Frederick Hume-Spry, 2nd Life Guards. The sixth carriage contained Mr. Ffennell, Mr. Bartlett, Mr. Fryer, and Mr. Searle. The following gentlemen, members of the Piscatorial Society, also attended the funeral: Messrs. Pearce, Sachs, Goodger, T. Huggett, Nicholay, Patterson, Rolfe, Jardine, Perelli-Rocco, Walker, &c., &c. Messrs. Brougham and Spreckley, of the Thames Angling Preservation Society, were also present. The company formed round the grave while the Rev. F. G. Braithwaite read the burial service, and the choir, who also attended at the cemetery, sang three of Mr. Buckland’s favourite hymns—“Jesus lives,” “I praise the earth in beauty seen,” and “Ye boundless realms of joy.” At the end of the service, and as the company were departing, sorrowing friends cast flowers upon the coffin, which soon became lost to sight from the abundance of these last tributes of affection.—*Daily News*.

FORECAST FOR JANUARY.—The month opens cold and raw. So do oysters.

LAMPERN-FISHING AT TEDDINGTON.

THE season for lampern-catching at Teddington Weir has been an unusually good one, and the fishermen, who have had little employment in fishing lately with anglers for roach and dace have been largely benefited. The continual rising of flooded water has been the means of bringing the lamperns up in great quantities, and they have at the same time been remarkable for their splendid condition. The greater portion of those taken have been consigned to Holland as bait for deep-sea fishing for cod; whilst large cargoes have found their way to the London houses where they are potted for sale. The men who catch them hold licenses from the Board of Thames Conservancy, and at this season of the year, when other fishing is reduced, the lampern trade is considered a great boon; but it is at the same attended with great expense and risk.

ADDRESSES OF GERMAN PISCICULTURISTS.

SALMONIDÆ are cultivated in hundreds of establishments in Germany, but we here give, from that invaluable work "Dunker's Fischerei Kalender, 1881," the names of a few gentlemen who cultivate other kinds of fish also, for the benefit of any who may be inclined to take up the matter in this country. We are very glad indeed to be able to state that Mr. W. Oldham Chambers, of Lowestoft, at our suggestion, has determined to make some experiments in rearing various kinds of fish other than salmonidæ. Every English angler will wish him success, and we trust the day is not far distant when any one desiring to stock ponds or rivers with carp, perch, pike, roach, rudd, bream, &c., &c., will only require to purchase a supply of ova or fry of Mr. Chambers. We have no doubt of his success; and it will be a grand day for English anglers when they learn that they can purchase any quantity of almost any kind of fish for stocking their waters.

(We give the German name as well as the English to facilitate ordering).

CARP (Ger. Karpfen).—The fish-breeding establishment (Fischzucht-Anstalt) Biberach, Baden.

CARP.—The fish-breeding establishment at Steinbach, Baden.

RUDD (Orfen).—Herr Koch of Reichenau on Untersee, Baden.

PIKE (Hechte) and **CARP** (Karpfen).—The fish-breeding establishment at Weisweil, Baden.

PIKE (Hechte).—The Brothers Kuffer at Munich. They also rear salmo hucho, char (saibling), lake trout (seelachs), trout (forelle), grayling (aesche). Herr Joseph Wispaver of Veitsgraben, in Upper Bavaria, makes all kinds of apparatus for breeding fish of various kinds.

GOLD FISH or **GOLDEN RUDD** (Goldorfen).—Herr Eugen v. Rüdiger of Amorbach near Mittenberg, Rhine Province.

TENCH (Schleie), **CARP** (Karpfe).—The fish-breeding establishment at Neustadt Rhine Province.

YOUNG EELS (Aal-brut), **TENCH**, **CARP**, **CRAY-FISH** (Krebse) **GRAYLING**, (Aesche), **Vendace** (Maräne), **salmo coruleus** (Schnäpel) and other salmonidæ.

CRAY-FISH (Krebse).—These German cray-fish are far superior to our English and are eaten all over the Continent; they fetch from a halfpenny to a penny a piece in the restaurants, but are only seen in this country on rare occasions at the tables of the wealthy. It would be a great thing to get them naturalised in our waters, and it could be most easily done, as we pointed out in our illustrated article on the cray-fish last January. The edel krebs, or noble cray-fish, is much larger than our English cray-fish and infinitely superior in flavour, in fact the English species is also to be found on the Continent, but is only eaten by the very poor. Paris alone consumes over £16,000 worth of them annually. They are very easily reared.

Fish of all Kinds.—Herr Max v. d. Borne the celebrated German Pisciculturist—in fact, the Frank Buckland of Germany—rears fish of all kinds at his splendid fish-breeding establishment at Berneuchen, near Küstrin, Brandenburg.

GOLD FISH (Goldfische).—Major A. D. von Humbert of Hohenkränig, near Königsberg, Brandenburg.

CARP (ova and fry) and **FISH OF ALL KINDS**.—Herr R. Eckardt of Lubbinchen near Guben, Brandenburg.

CARP, **PIKE**, **TENCH**, **GOLD FISH**, **GOLDEN CARP**, and **SALMONIDÆ**.—Herr J. W. Wissenbach of Herborn, Nassau.

ALL KINDS OF SUMMER AND WINTER SPAWNING FISH and **CRAY-FISH**.—Dr. Kammerer of Audershof, Pommerania.

CARP.—Herr Werekmeister, of Coslin, Pommerania.

CARP.—Major Scholz, of Przygodzico, near Ostrowo, Posania.

STURGEON (Stör), and **LAMPERN** (Neunaugen).—The Itzehoe Fishery Association of Beidenfleth in Schleswig-Holstein.

STURGEON (Stör).—Count Zelinsky of Slotwina, near Bieczko, Galicia.

THE DANUBE SALMON (Salmo Hucho) (ger Huchen).—The Upper Austrian Fishery Association of Linz in Upper Austria, Director Herr H. Danner.

GOLDEN CARP (Goldorfen) seem to be largely cultivated at St. Ulrich, near Eibiswald, in Steiermark (Tyrol) at the different establishments. Messrs. M. Kohlberger, J. Silberschneider, S. Zmuck, V. Zmuck; also by Mr. Max von Washington at Pols Castle, Werndorf, near Wildon, Tyrol.

Summer Spawning Fish.—Herr Stoffel of Herrmanstadt, Hungary.

We think at some of the above establishments perch are also cultivated, and we do not see that there would be much difficulty

in transporting perch ova from one part of the country to another. As all Thames anglers know, perch deposit their spawn on boughs just below the surface of the water: what difficulty would there be in carefully removing some boughs with spawn on them, placing them in a suitable carrier, and taking them to stock some pond or river where the boughs could be submerged as before in such a way as to be protected from swans, ducks, etc., and yet exposed to the sun's rays? The perch is a splendid fish, whether for sport or the table, but a very difficult fish to keep alive in a carrier or aquarium, after it has once left the egg state.

We fear it will be a long time before we English take to consuming fresh-water fish to any great extent (except, of course, salmon and trout), partly because we have forgotten how to cook them (in the "good old times" every manor had its fish-stews), and chiefly because sea-fish is now so cheap and easily procured even in the most central districts. At the same time we fancy our readers would be surprised if they knew the high prices perch, carp, pike, etc., fetch in the London market. If we are not misinformed, perch will at times fetch as much as four shillings and sixpence per pound; and at Sweeting's the other day we saw a row of jacklets, for they were not much more than a pound apiece, which were selling at 2s. 6d. and 3s. each. But it is from an angling point that we view the matter with most interest. Anglers are increasing, and angling clubs are springing up everywhere. There is abundance of water, but how many ponds, lakes, and rivers are not already fished out? If they are suitable for trout, by all means put trout in; but if not, then why should not jack, perch, tench, carp, chub, roach, etc., be bred to stock them with?

CORRESPONDENCE.

[We do not hold ourselves responsible for opinions expressed by our Correspondents.]

ANSWERS TO CORRESPONDENTS.

SALMON FISHER.—You will get every information respecting salmon and trout fishing on the Usk by writing to Mr. Hughes, stationer, Brecon, or of the Castle Hotel Company, Brecon.

THE PARR AND SAMLET.

SIR,—I hope I may be pardoned for adding one more letter to the long list which has already appeared on this subject; but as you have personally, as well as Mr. Gosden, expressed some interest in the subject, I think it is only fair that the controversy should not be ended by two letters full of error and apparently designed misstatements. In justification of this opinion, I make a quotation from the last letter of Mr. Spence:—"Raven" . . . Larger and stronger than in salmon; the third and fourth rays longest," &c. Now turn to my article of Oct. 30; we find "Pectoral larger and stronger, standing out in the salmon; in the parr less, softer, and lying close to the body." Mr. Spence has had the audacity to insert the word "than" and omit the rest of the sentence. This is only a single example of misquotation. I see no discrepancy in the various descriptions of the pectoral fin, for, if we are to believe Mr. Spence as set forth in his original letter, Yarrell was describing the samlet under the name parr, whilst Parnell plainly made a caligraphical error when writing his description, making a faulty transposition of the words parr and samlon in a solitary case, when writing a long comparative account; and years ago, when I read his article, I altered the words in my own book, as too palpably an oversight. The number of fin rays is of no importance. All the other anatomical features are permanent, but the colour of the fins is slightly variable, as I have certainly found the adipose fin of a pink hue. I shrewdly suspect that the almost white-coloured fins which Mr. Spence has caught at times were real parr, but that this gentleman has not been able to discern the species when he had it before him—the anal fin of the parr having only the white border as in trout, but without the black edging. If anglers will remember that the parr resembles the samlet in nothing but colour, that in this fish trout characteristics are intensified, and that in structure it differs more from the salmon than does the trout, less confusion will be apt to arise. Apart from Yarrell, Mr. Spence adduces seven famous authorities who support "The Raven" in declaring the parr a distinct species, with fairly prolific males and females.

Mr. Gosden gives an extract from "British Zoology," vol. iii., p. 309. The description (1-7) is plainly that of the young salmon, but clause No. 3 refers to the operculum and not the pectorals. The general remarks which follow are a confused medley of facts relating to both parr and samlet.

Mr. Spence believes that I skulk behind a *nom de guerre*; but I fancy it is this gentleman who shelters himself beneath his real name, for it is more difficult and unpleasant to bring home error to such an adversary, than to one who with disinterestedness employs a pseudonym. Mr. Spence's excuse for withholding proof is laughable; the excuse takes more words than the proof. Had Mr. Spence said:—"I caught the 98 trout, left in the stream, alive, and can produce two witnesses to substantiate my assertion," something more like proof would have existed. Mr. Spence it was who first demanded witnesses; these I can produce for my experiments. In the case of one pond belonging to my sister, the water was let off and the facts ascertained, and I hope soon to be able to give our editor ample opportunity for verifying them personally in their entirety. The interpretation I put on the passage relating to the carriage of fish 15 miles was both just and fair, let any one decipher the meaning who may. Mr. Spence can neither read his own arguments correctly, nor those of "The Raven." The quotations relating to the death of fish are ridiculous; I have always said the bulk of the fish died long after capture, usually not before the next day, and one in 50 is a remarkably high percentage for instantaneous mortality. There is no passage from the air-bladder of trout—and I have been speaking of many other fish as well—of sufficient bulk to allow the egress of air from the organ so quickly as to prevent rupture or injurious distension

under sudden compression. Rupture, I believe, rarely takes place, as the bladder is very tough and elastic, but injurious and painful distension must occur. The bony envelope covering the heart is far too weak to offer any effectual resistance to force, and Mr. Spence, in his frequent visits to hospitals, must have become aware that much violence may be done to the body and yet death be protracted for a long time. Printers' errors or one's own occasional inadvertence often play strange vagaries with a writer's composition, where the author has not the "proofs" for inspection. In the sentence with which Mr. Spence finds fault I see no haziness, neither can the words be contorted into three different meanings: "for an inferior" is not "as an inferior," neither is "for an inferior fish, to the Marines" "for a fish inferior to the Marines." Had Mr. Spence taken the words to mean what they imply, or credited myself or the printer with the accidental omission of three words, so as to render the reading "for the sake of," he would have done his common sense more justice, and not allowed it to stray in search of meaningless quibbles. There is more butchery in slaughtering 41 sea-trout, for which, I suppose, Spence could have no use, than 100 trout and samlets, all of which he could readily eat himself. It would be interesting to know the proportion of trout present amongst these numerous samlets. It must have been small where there are so many sea-trout; whilst how does Mr. Spence account for capturing such numbers of diminutive fish when employing sea-trout flies and tackle? To throw back any great number of trout for sea-trout I should consider a sure indication of aberration of intellect, whilst it would be an advantage to anglers to know by what system the number of returned fish was kept when it reached high double and treble figures. I can only say it is a difficult matter to keep the numbers for each fly when you actually have the fish in your creel to check your figures. Has Mr. Spence never thought of the sea-trout's belly and his returned fry, or does he expect the latter to come back with as much felicity from the former as did Jonah. In answer to any other questions which may have been put, Mr. Spence would do well to read the whole correspondence with quoted authorities more thoroughly; it is a waste of time on my part to make answer. But whilst this opponent, with others, accuses "The Raven" of writing at variance with fact and consummating a gross hoax, I must point out that, on the one hand, the statements are strictly true; my aim throughout has been the exposure of error and crude theories; whilst, though I had no great anxiety or hankering for liberty to capture samlets—and in this respect did not support Mr. Byers—yet I fully appreciated this gentleman's candid avowal and never had the least idea of ridiculing his cause. I do not see why other anglers should not feel delight in capturing a fish that is not the object of my own special attention. Finally, I am prepared, should our editor express the wish, and should he not have come across the real parr himself, to place in his hands every means I can of substantiating all my statements of facts in various articles and letters. I can do more. My *nom de guerre* I had long before the controversy began, and I do not feel bound to satisfy the whims of cantankerous opponents by divulging the identity of

THE RAVEN.

In the 29th line of the last paragraph of my article on the parr, the words "it may be shown that in the young" should be "it may be shown that in the river Towy," giving a very different meaning.

P.S.—"Sprint" asks me a question, but asks in such a manner that it is impossible to forget that one cannot touch pitch and be undefiled. He need not ask me to be his hairdresser, and call up memories of a *dead ass*. I am not at "Sprint's" beck and call, whilst I, "The Raven," do not need to officiate on his person, or comb out the tangled ravels of his composition for the public gaze, or even listen to the sighing of a whispering wind to learn in what respect he resembles King Midas.

For the readers of the FISHING GAZETTE, I make the following quotation from Couch, taken from Jardine's article in the *Edinburgh Philosophical Journal*:—"It has latterly resolved itself into whether it (the parr) was distinct, or a variety or young of the common trout (*S. fario*). With the migratory salmon it has no connection whatever." In the Gwdderig I have caught the adult parr larger than the common trout in the same river; the question is therefore satisfactorily settled as to the fish being a distinct variety of the river trout.

[This must close the controversy.—ED.]

WILL DUCKS EAT TROUT SPAWN?

SIR,—I should be much obliged if you will let me know if ducks will eat trout spawn.

The piece of water is a reservoir, and the proprietors have put up a grating to keep the fish in, and they are keeping down the water for the trout to spawn in one of the corners.—I am, &c.,

R. H. BUSH.

[Every aquatic bird, whether domestic or wild, will devour any kind of fish spawn, and you must protect the spawning bed in some way—wire netting is generally used.—ED.]

AN APPEAL.

SIR,—As I was requested by a resolution passed at a public meeting to act as the honorary secretary to a Bazaar in aid of St. John's Hospital for Diseases of the Skin, I may be pardoned for asking you to accord me space in your columns to appeal to the public for help. Charles Reade, the eminent author, says with reference to it:—"The fatal scurvy, the foul leprosy, the maddening eczema, are all skin diseases; and all far more common than supposed, causing the sufferers to be despised or shunned, whereas internal maladies invite the boon of sympathy: Take the fate of domestic servants so afflicted. Their employers dismiss them, however meritorious, and their friends shun them; mental despair too often follows, and they say with the Patriarch Job, whose bodily affliction, selected by knowledge and malignity in person, was a disease of the skin: 'my misery is greater than I can bear.'"

"Against such a weight of suffering, shame, and sorrow, what is the special provision in our enormous city? I am acquainted only with one small hospital—that ought to be a great one, and will be in a year, if the public pleases."

"This is St. John's Hospital for Diseases of the Skin in Leicester Square, where the medical officers prescribe on an average for nearly four hundred patients every week. It has already admitted 25,175 new patients."

"It is open without payment to all creeds and all races, the sole credentials for admission being disease and poverty. A leper from India, a Jew from New York, a labourer from New Zealand, mariners from Germany, a clerk from France, have been some of its inmates."

The Bazaar will take place in June next. In the meantime St. John's Hospital labours under a heavy load of debt. I beg you therefore, to let me urge

your readers to subscribe *now* to the Bazaar Fund and their amounts shall be at once handed over to the hospital. A more deserving charity does not exist. I shall also be very glad to receive the names of ladies who will work for the Bazaar. Contributions may be sent to the chairman of the Hospital, the Right Hon. W. N. Massey, M.P., 71, Chester Square, S.W.; to its treasurer, Major Mercier, 138, High Road, Knightsbridge, S.W., to the following members of the Board of Management, the Marquis Townshend, Ball's Park, Herts; Sir Charles Palmer, Bart., Domey Court, near Windsor, and Colonel Gourley, M.P., Sunderland; also to the London and County Bank, Albert Gate, S.W., and the London Joint Stock Bank, Pall Mall, S.W., and to

Your obedient servant,

ROSA FREELAND, Hon. Sec.

Dec. 20, 1880.

12, Ovington Gardens, S.W.

TRENT BOARD OF CONSERVATORS.

SIR,—An opposition to the 1s. trout license in the Trent Fishery district is being organised on the grounds that the water-bailiffs of the Board are now required on the small tributary trout streams. Now, sir, let us state that our experience is that poachers molest little trout streams more than the main stream. The convictions obtained by us in 1880 prove this. Secondly, let us insist that the tributaries are the breeding grounds for all fish. Thirdly, that the present staff of water-bailiffs are paid exclusively by the salmon-license holders. They reasonably complain that they pay the bailiffs and the fresh-water fish anglers reap the benefit. Two courses are then open for the Board. The first is so to augment their income as to enable them to protect all species of fish alike throughout the district. The proposed 1s. annual rod-license for trout is calculated to effect this. The second, which will directly affect the small trout streams, and their owners off the main river Trent, in a way that the opposers do not see, is to watch and protect salmon only and keep our existing staff of water-bailiffs on the main body of the river. The consequence of this step will be to drive the lime and dynamite fraternity off the Trent on to the tributaries when they know they will be uninterrupted.

We earnestly hope that the idea that a sport that all can afford and enjoy should now be taxed will not prevent the anglers giving this important step the consideration it deserves in their own interests.

We are willing to give our time to effectually stop illegal fishing, and we ask each angler in the district to drink six glasses less beer in the year and hand the 1s. over to the board to enable us to protect all kinds of fish. A very great number of persons are in favour of the license, but an opposition exists, consisting of a few upper proprietors who style the license an "interference with private rights." The Board will not favour the license if it be objected to by a fair representative body of those who fish in their own water in the district; but if such objection is carried we disclaim all responsibility in protecting fresh-water fish, and shall be compelled to apply the powers of the Board solely to the Salmon Act, the source from which they are derived. We ask, therefore that each angler who approves of the 1s. rod-license to fish for trout will write a post-card to that effect to Col. Hutton, Gate Barton Hall, Gainsboro, without delay.—I am, &c.,

ALAN BAGOT, Willoughby Wood,
Conservator for Staffordshire and Derbyshire.

Dec. 22, 1880.

EAST COAST FISHING-NETS.

SIR,—I am told that a new kind of net has been used in the herring fishery on the East coast for the last two seasons. This has been described to me as a species of purse net or trawl.

Perhaps your Yarmouth correspondent will kindly enlighten me on the subject.

E. GOSLING.

Budleigh Salterton, Dec. 29, 1880.

FISHING AT DEMERARA.

SIR,—Can you or any of your readers oblige me with some information with regard to the fresh and salt water fishing at Demerara? I have a friend going out there who would like to know the kind of rod, winch, flies, spinning-baits, &c., best suited for the fishing there.—I am, &c.,

H. E. G.

Richmond, Dec. 27.

[We should advise your friend to take a very strong hickory pike rod, spoon-baits of various kinds (see the swivels and fastenings are all brass and *not steel*), and an assortment of trout, lake trout and salmon flies. The sea swarms with sharks, but there are good sporting fish of various kinds in the rivers and lakes inland, which take fly or bait well. Strong tackle is needed and long and strong winch line.—ED.]

THE OYSTER'S LAMENT.

Having read in *Land and Water* that "Nothing is so fatal to the oyster as sand," *Punch* sings—

" 'Tis the voice of the oyster, I hear him complain:
'I can't live in this place, here's the sandstorm again.
I was settling to rest 'mid the rocks and the tiles
They had made for a home, but this sand, how it riles!
It gets into my shell and the delicate fringe
That I use when I breathe; and I can't shut my hinge
When the grit lodges there; so the crabs come at will;
Since my poor mouth is open they feed and they kill;
I've complained to a friend, who quite understands,
But he can't undertake to abolish the sands.'
Thus the 'native' made moan, then I took up the brown
Bread and butter and lemon and swallowed him down."

DR. FRANCIS DAY, late Inspector-General of the Fisheries in India, is about to publish an important work on the fishes of Great Britain and Ireland. It will deal with the structure of fishes generally and their geographical distribution, and with the economic uses, modes of capture, diseases, breeding, and life history of the fishes of Great Britain. The work will consist of over 200 plates and letterpress of about 700 pages, and it will be published in parts of about 25 plates and letterpress at intervals of six months, the first to appear immediately. The author has limited the edition to 250 copies, and when it is disposed of he will still be a considerable loser. Messrs. Williams and Norgate are to be the publishers.

CLUB REPORTS.

ALEXANDRA SOCIETY OF ANGLERS.

Seveel of our members went out on Sunday, December 26th, but with no success, and a blank is all I can record. One of our members, Mr. R. Elam, was expelled from the club last Thursday he having purchased fish and weighed them in to his account. Mr. Williams, from whom he bought the fish, gave evidence against him, and when he sold the fish was not aware that he belonged to a fishing club.—C. HARTLAND, Secretary.

CITY OF LONDON ANGLING SOCIETY.

Only two members out on the 26th. Mr. Castell weighed roach from the Roding and Mr. Mortimer roach from the Rye House water.—CAS.

GLOBE ANGLING SOCIETY.

The members of this Society met at their new club house, the Bank of Friendship, Blackstock Road, Highbury Vale, N., on Monday, Dec. 20, 1880, to celebrate their second anniversary, and partook of a most excellent supper, provided by their worthy treasurer, Host Hobbs, in a manner ever to be remembered by all who had the pleasure of being present. After several appropriate toasts and some excellent singing, the prizes were distributed by the secretary, and a very promising prize list started for the ensuing season. The company separated at 12.30, after spending a most enjoyable evening.
Dec. 28, 1880. J. CHURCHMAN.

HAMMERSMITH UNITED.

Several of our members were out on the 28th, but owing to the state of the water small takes only were had. Messrs. Walters and Marsh had roach and gudgeon from the Thames, and Mr. Eden fishing in private waters succeeded in landing one pike weighing 5 lb. 9 oz.—VORTEX.

THE BOSTONIAN ANGLING SOCIETY.

On the 29th inst. Mr. Collier, roach, three fish, together weighed over 3 lb., Mr. Hart also a nice show of rnoch and perch, several very nice fish amongst the show.—H. A. V., hon. sec.

THE SWIMMING BLADDER OF FISHES.—In a recent note to the Paris Academy, Prof. Marangoni, gives the results he has arrived at in a study of the swimming-bladder. He states, first, that it is the organ which regulates the migration of fishes, those fishes that are without it not migrating from bottoms of little depth, where they find tepid water; while fishes which have a bladder are such as live in deep, cold water, and migrate to deposit their ova in warmer water near the surface. Next, fishes do not rise like the Cartesian diver (in the well-known experiment), and they have to counteract the influence of the swimming-bladder with their fins. If some small dead and living fishes be put in a vessel three-quarters full of water and the air be compressed or rarefied, one finds in the former case that the dead fish descend, while the living ones rise, head in advance, to the surface. Rarefying has the opposite effect. Fishes have reason to fear the passive influence due to hydrostatic pressure; when fished from a great depth, their bladder is often found to be ruptured. Thirdly, the swimming-bladder produces in fishes twofold instability, one of level, the other of position. A fish, having once adapted its bladder to live at a certain depth, nay, through the slightest variation of pressure, be either forced downward or upward, and thus they are in unstable equilibrium as to level. As to position, the bladder being in the ventral region, the centre of gravity is above the centre of pressure, so that fishes are always threatened with inversion; and indeed they take the inverted position when dead or dying. This double instability forces fish to a continual gymnastic movement, and doubtless helps to render them strong and agile. The most agile of terrestrial animals are also those which have least stability.—*American Naturalist.*

TRENT FISHERY DISTRICT.

ABSTRACT OF LAWS FOR THE PROTECTION OF FISH.
(Approved by the Trent Fishery Board.)
DATES OF CLOSE TIMES.

For all freshwater fish other than trout (except with leave of owners) March 15 to June 15.

*For trout and char	Oct. 2 to Feb. 1.
*For grayling	March 15 to June 15.
*For salmon, with nets	Sept. 1 to Feb. 1.
*For salmon, with rod	Nov. 1 to Feb. 1.

*These are all compulsory.

The young of salmon (pink, parr or smolt, distinguishable by dark stripes across the back) may not be taken at any time. Salmon taken accidentally without a licence, or all fish taken in close time accidentally, must be returned to the water.

No eel net may be kept down between January 1st and June 24th.

All these dates are inclusive.

The close times apply to the Trent and its tributaries throughout the fishery district, i.e., in the county of Stafford, Warwick, Derby, Leicester, Lincoln, Nottingham, and the East Riding of York, and as much of the Humber as lies east of the Trent Falls.

A license is necessary to take salmon; to be obtained from T. Worthington, Esq., Derby, or Col. Hutton, Gate Burton Hall, Gainsboro, secretaries to the Trent Fishery Board.

PERIOD DURING WHICH THE SALE OR EXPOSURE FOR SALE OF FISH IS ILLEGAL.

Salmon	between Sept. 3 and Feb. 1.
Trout and char	Oct. 2 and Feb. 1.
Grayling	Mar. 15 and June 15.
Perch, pike, roach, &c.,	Mar. 15 and June 15.

All these dates are inclusive.

Landowners are requested to make their keepers acquainted with the close times and the following relating to them.

The Salmon Act provide a close time for salmon and trout which is a compulsory one throughout England.

The Freshwater Fisheries Act provides a compulsory close time for grayling and char, and a close time (optional to owners) for freshwater fish. Grayling and char may not be taken by any one in the close time.

POACHING.

Netting by day, nightlines, and fishing without permission (if out of the close time) must be dealt with by the owners as an illegal trespass, an ordinary summons will suffice.

If in the close time the case should be also reported to the secretary of the Trent Board at Derby, T. Worthington, Esq., who will also prosecute on behalf of the Trent Fishery Board.

POISONING FISH.

A summons should be taken out by owner for malicious injuries to fish, and the case also reported to the Board.

DYNAMITE OR OTHER EXPLOSIVE.

Special Act. Report to the Board, who will prosecute.

NETTING AT NIGHT.

By a bye-law of the Trent Fishery Board this is illegal; report to the Board. If in close time seize all nets and fish as evidence.

Persons obstructing water bailiffs in the execution of their duty, or refusing access, are liable to a fine of £5.

Private waters are not watched as a practice by the Board, except in close time or under special circumstances.

Keepers reporting on any offence to the Board, are reminded that, a report specifying names, dates, time and nature of the offence, also precise locality, must be made out for the information of the Board before two months have expired from the date of the offence. All summonses must be taken out within that time.

Owners of waters may obtain warrants for their keepers or themselves to act as water bailiffs, on application to T. Worthington, solicitor, Derby.

POLLACK, BASS, MACKEREL.

HEADER AND SON,

Deep Sea, River and Lake Fishing Tackle Makers to H.M. Government, H.R.H. Prince of Wales, H.R.H. the Duke of Edinburgh, and exploring expeditions,
195, UNION STREET, PLYMOUTH.
Established 1770.

Mounted lines for cod, conger, hake, whiting, bass, pollack, mackerel, and all kinds of fish at home and abroad.

Specialities for foreign fishing. Inventors of the celebrated silver spinners, spinning sand eel and sole-skin bait for pollack, mackerel, and bass.

Eleven prize medals, including Berlin Fishery Exhibition, 1880. Illustrated Catalogue gratis.

(THE DEVONSHIRE RIVERS.)

FISHING TACKLE, &c.

DEVONSHIRE FLIES (GOOD in ANY STREAM), 1s. 6d. per dozen. Flies made to pattern. A large stock of Rods and Tackle of all kinds. Some choice SPLIT CANE RODS by "Copham;" bargains. The Devon and other artificial Baits, Reels, Lines, Gut Casting Lines, Fly Books, Wading Stockings and Trousers, Baskets, and every other requisite. Address, WILLIAM MUDFORD, Fore Street, Tiverton, Devonshire Ticket depôt for the Tiverton Fishing Association.

ALFRED YOUNG,

THE GOLDEN PERCH.

174B, OXFORD STREET, LONDON, W.
FISHING RODS and TACKLE of every description.

THE CELEBRATED GUINEA FLY ROD.

The Angler's Handbook and Catalogue of Prices, with 80 Illustrations of Rods, Flies, Baits, Tackle, &c., post free on application.

"I'll now lead you to an HONEST alehouse where we shall find a cleanly room."—Isaak Walton.

ANGLING.—Within one hour and a half of Paddington by "Rail and Road," excellent all-round fishing, either from bank or punt, in an UNFREQUNTED and lovely part of Mid-Thames. Card or letter in advance will ensure close or open trap meeting any train at Maidenhead. Every reasonable accommodation for small or large parties.

WM. CLAYDON,

EAST ARMS,

HURLEY, BERKS.

POST TOWN—GREAT MARLOW, BUCKS.

BUY DIRECT.

PURE WINES & SPIRITS

Obtainable at Wholesale Price from

Newsvendors can obtain the journal through their London Agents.

* * The "FISHING GAZETTE" SPINNER (Registered) is sold by all the above firms.

ANNUAL SUBSCRIPTION.

The Annual Subscription, payable in advance, for the United Kingdom is 8s.; or post free, 10s. 6d.

To any part of Europe, the United States, and Canada, the Annual Subscription, including postage, is twelve shillings and sixpence.

ADVERTISEMENTS.

All communications respecting advertisements must be addressed to the Manager of THE FISHING GAZETTE, No. 12, Fetter Lane, London, E.C.

N.B.—All Remittances must be sent, and all Cheques and Money Orders must be made payable to ROBERT B. MARSTON.

The Fishing Gazette.

SATURDAY, JANUARY 8, 1881.

THE BROADS AND RIVERS OF NORFOLK AND SUFFOLK.

PART I.

IN the autumn and winter, the wild-fowl flying southward and westward in search of less rigorous climes are arrested by the projection of the Norfolk coast, and see beneath them, but a few

miles inland, the gleaming surface of lagoon and river, and vast expanses of reed-beds. If they flew all England over they could find no spot so fit for them as this district of marsh and shallow, lake and reed; so down they drop and stay until the spring lures them back to their more northern breeding-places. All do not return; the gun, the decoy, and the snare thin their ranks; but many also, which have found the loneliest spots in this lonely region, are so fascinated that they stay to breed, and then the collector too often finds out their retreat.

The smaller migrants too, which visit us in the spring for the purposes of breeding, are arrested by this obtrusive Norfolk, so that it is a county favoured beyond others in an ornithological sense. It has been said that "all England can be carved out of Norfolk," meaning that there is every variety of land and scenery (save mountains) within its borders. A triangular gap in it will represent the flat and watery Broad district on its eastern tide, while the rest consists of hills, woods, enclosures, wide open commons and heaths, and rich corn and pasture lands. Our present concern is with the Broad district.

The term *Broad* is peculiar to Norfolk. Its etymology is obvious—namely, a *broadening* out of the rivers into lakes, the Broad being intimately connected with the rivers, which in some cases flow through them, and in others are only divided from them by a reed-bed. Whittlesea-mere and other parts of the Fen district were the counterparts of the Broad in many respects; but the character of the Fens has so much changed since their drainage, that it is to Norfolk only that one can now look for the wildness and solitude of marsh and mere so dear to the naturalist and sportsman:

If you take the map and draw a line from Pakefield, on the Suffolk coast, 27 miles north to Happisburgh, and then across to Norwich, 18 miles inland, then with a curve south-east back to Pakefield, you will have a triangle which comprehends the chief of the Broad and Rivers—a district for the most part as flat as a billiard-table, where water and land strive for the mastery, and come to a delightful compromise. This tract of country is intersected by three principal rivers, and dotted with a score of lakes. First, below Norwich (a city of nightingales, which are very numerous in its suburbs), the smaller river Yare flows into the larger river Wensum, and then the united stream, under the name of the Yare, flows a sinuous course of 35 miles, until it debouches into the sea at Yarmouth.

For all this distance the river is broad and deep, and in the lower half the tide ebbs and flows, "backing" up the water even up to Norwich. The natural fall of the river is only four inches in the mile; the rise and fall of the tide is very little. There are no locks, and only one bridge, which is a "swing one," so that the Yare is the perfection of a navigable river. For five miles below Norwich the banks are hilly and wooded, but afterwards the water is bordered by tall reeds, and beyond the reeds are miles of marsh. The only broads on the upper part of the Yare are Surlingham and Rockland, both of limited extent; or rather the open water has been so reduced by the rapid growth of the reeds and aquatic vegetation that these appear to be small. Just above Yarmouth is the magnificent tidal lake called Breydon. Roughly speaking, it is five miles long by two-thirds of a mile wide, and at high water, when the muds are covered, it forms a noble expanse of water—the deeper channel of the river through it being marked by painted posts to guide the vessels sailing across. At low water the muds or flats on either side are dry, and attract myriads of wild-fowl, which find their food on the soft ooze, and in winter afford sport and sustenance to the gunner in his flat-bottom punt. One of these men told us that he once cut a small canal, about a foot deep and three feet wide, through the ooze, from the channel to the bank near his cottage, a distance of

100 yards, so that he might get ashore at low water without wading through the mud. In three weeks, such was the action of the tide, the depth was 6 feet; and now it is 17 feet at low water, with a proportionate width. And as men win immortality by various means, he is proud that it is now called by his name—Calver's drain.

The river Waveney also enters in at the top of Breydon, and is navigable for seven-and-twenty miles southward and westward through Beccles to Bungay in a sinuous-like course. The peculiarities of the Waveney are its depth, which is 20 feet close to the banks in places, and the surpassing clearness of its water. While sailing up it you may see, yards beneath you, the tops of waving weeds and shoals of frightened fish, while the blue of its surface, and the white of the waves which rise at the bows and eddy astern, are only paralleled by the blue and white in the sky above. A canal, or cut of three miles in length, connects the Yare at Reedham with the Waveney at Haddiscoe. A mile and a half from the latter place is a beautiful sheet of water, two miles long, named Fritton Broad, which is interesting, inasmuch as there are two decoys upon it still worked by the proprietors. A wide cut called Oulton Dyke connects the mid-length of the Waveney with Oulton Broad, 100 acres in extent, and the most civilised of all the Broads, inasmuch as it has a village on its banks and always a fleet of yachts on its surface. At the lower end of the Broad is a lock which gives access to a tidal lake called Lake Lothing, two miles long—then comes Lowestoft harbour and the sea.

Returning to the lower end of Breydon Water, we find the mouth of the Bure, which flows from the north-west, and is navigable up to Aylsham, a distance of 40 miles by river. It is up this fine river and its tributaries that the wildest and most interesting of the Broads lie. First, as we go up, is a sheet of water with many arms known as Ormesby, Filby, and Rollesby Broads, containing together about 800 acres. These are not accessible from the main river except by small boats, and along a dyke bearing the euphonious name of Muck Fleet. "Fleet" is a Norfolk word for shallow,—a fleet place is where there is but little water. A few miles higher up we come to the Thurne, a broad river which communicates with Hickling Broad, Whiteslea, Horsey Mere, Heigham Sounds, and Martham Broad. Of these Hickling is the largest, covering some 400 acres. All the Broads are very shallow, but this is the shallowest, its depth not exceeding four feet six inches, except in the "channel."

Its water is beautifully clear, and its bottom is of hard yellow gravel, over which shoals of fish scud away as one's boat approaches. All the other Broads have bottoms of black mud of an unknown depth, and so soft that a yacht's anchor will not hold in it, so that large blocks of iron ballast are used instead, and will not drag through the "putty," as the mud is locally called. Returning to the Bure, we come to the mouth of the river Ant, which leads to Barton Broad, 200 acres in extent, and to Stalham Broad. Again returning to the course of the Bure, we come to a group of Broads—Walsham, Ranworth, Decoy Broad, Hoveton Great and Little Broads, Salhouse, and lastly, Wroxham—a large and very beautiful Broad, where regattas are frequently held. Above Wroxham is Belaugh Broad. To sum up, there are here 200 miles of navigable rivers, and 5000 acres of water in the Broads.

The marshes around the group of Broads up the "north river," as the Bure is usually called, are left in their pristine wildness; but in the lower waters there is a very complete system of drainage. The river-surface, as a rule, is much higher than the adjacent marshes, which, as the moisture was pumped out of their peaty and spongy soil, shrank and sank just as a sponge does in drying, until they left the river-level several feet above them. A

low embankment on either side of the river confines its waters, and at the outlets of the drains are pumps which lift the water out of them into the river. These pumps were all formerly, and many still are, worked by means of small windmills; and it is a curious sight, on looking over the wide marshes, to see the scores of windmills all twirling merrily round. Steam is now used at the outlets of the more important drains, and does the work more effectually. Even now the water often gains the mastery. Last winter there were very heavy floods. The millers in the upper reaches, above the navigation, headed up the water for storage until they simultaneously became alarmed at the quantity, and then they opened their flood-gates, and a vast body of water inundated the lower part of Norwich, and covered all the marshes, so that from Norwich to Yarmouth was a vast lake. The marshes were also inundated in the summer, or rather the time of the year which should have been summer in this watery year of 1879; and it was a singular and striking sight to see the great expanse of smooth, steadily flowing water, with here and there a pollard willow or a boathouse standing alone above it. It was before the marsh hay was cut, and some of the occupiers towed large spars about over the submerged grass to prevent, as far as possible, the mud in suspension from settling upon it.

It might be imagined that the scenery of such a flat and marshy country must be most uninteresting. Yet it is not so, except, perhaps, near the sea, where the vegetation is not so luxuriant as it is in the upper reaches.

On either side of the river and around the Broads is a dense wall of emerald-green reeds from seven to ten feet in height. Then come the yellow iris flowers, tall and bending rushes and bulrushes, the sweet sedge with its curious catkins; tankled feathery grasses, in such variety that, as you stand up to your neck in them, you may pluck a dozen kinds without moving; blue clusters of forget-me-nots, fox-gloves, spikes of purple loosestrife, and broad tufts of valerian; bushes of woody nightshade; and, sweeter than all, masses upon masses, all the way along, of the cream-white and strong-scented meadow-sweet;—these are what make the immediate banks changing panoramas of kaleidoscopic beauty. Then on the water, beneath the reeds and across shallow bays, and in the little "pulsks" or miniature Broads which everywhere open off the river, are lilies, yellow and white, in dazzling abundance. Here and there are tropical tangles of wood; a picturesque house in a cluster of trees, or a reed-stack floating on the river with a supporting wherry hidden somewhere beneath it.

The far-reaching marsh has a beauty of its own, that of changing colour as the wind bows the many-tinted grasses and flowers, and the wind-waves and cloud-shadows sweep along; while everywhere are the snowy sails of yachts and the red-brown canvas of the wherries. The atmospheric effects, too, are unusually beautiful, and sunrises and sunsets glow with a warmth of colour that gives the placid lagoons an almost unearthly loveliness; while, when the sun is set, the mists often show lakes and ships and islands that vanish with the dawn. Colour is seen far away; a group of red and white cattle, or the scarlet berries of the guelder rose entwined around some fallen willow, with a gleam of sunshine upon them, will lighten up miles of marsh. Then the flight of hawk and heron, snipe and wild duck, the splash of fish, and the scattering rush of the small fry as a pike makes his raid upon them, are incidents of every hour.

Whether one is observant or not, one cannot help "brushing elbows" with the bird-life of the Broads. It is not the purpose of this article to describe the many rare species which visit or nest in the district, but rather to call attention to the everyday life therein. Embark with us, then, on board one of the small but comfortable river-yachts, and see what a single summer's day

will show you. As we sail up the "north river" we see constantly the coots and water-hens as they swim in and out of the "rond," as the reed-covered water-washed bank is called. Every now and then a wild duck or widgeon or a brood of flappers is disturbed by our passage; and as we sweep round corners, herons rise on lazy wing, or, if out of gunshot, look suspiciously at us. High in air the marsh-harrier, the "Norfolk hawk," scans the marshes with hungry eye; then we turn suddenly as if trying to charge an oak coppice, but a narrow "gateway" reveals itself, and we glide through it on to Wroxham Broad, which is skirted by the river, the only division being a narrow "rond." On the other side beyond the reeds the land rises in wooded undulations, with park-like spaces between. All around the Broad is a dense and sheer wall of bright green reeds eight feet high, with a yellow water-mark on their lower stems. In and out of this the coots, water-hens, grebes and wild ducks are continually splashing and swimming. While our man is making the yacht snug for the night, we go in the jolly-boat and push her anywhere into the reeds and wait. The black-headed buntings, the reed-wrens, and the bearded tits gather close around us, and chatter and scold us vigorously; for very little search would reveal their nests. A kingfisher flashes along and perches on a swaying reed within a few yards, and drives in again and again for the tiny roach and bream. Look, within ten yards are a pair of great crested grebes and three young ones,—tiny black balls, which their parents are feeding. These dive rapidly and rise with a fish two inches long in the beak; this is at once transferred to the young ones, which are also making ludicrous attempts to dive like their seniors. It is the last week in June, and the cuckoos have come to the Broad in numbers; why, we do not know. But they are flying across and perching on the trees, and calling loudly to each other, often with a note broken into three syllables—thus, cuck-cuck-oo. A fortnight later there will scarcely be one there, and the distinctive cry will have ceased. Over the marsh, on the opposite side of the river, two brown owls are hawking in the bright sunshine, and, from the number of times they swoop, with great success. Overhead, no less than five snipes are sweeping and circling about, and as they descend for short distances with quivering tail and wing-tips, we hear that curious bleating or buzzing sound ("lamming" the Norfolk people call it, because of its similarity to the bleating of lambs) which is a characteristic of the snipe in the breeding season.

In the distance are many white birds flying about, and from them arises a noise like that of a rookery. We cross the Broad and the river, and enter a narrow water-lane between the reeds. This presently expands into a "pulk" studded with water-lilies, between which numbers of coots and water-hens are threading their way. The water is only a foot deep and very clear, so that we can see hundreds of big bream swimming lazily, about while smaller roach and rudd play on the surface. Here and there, as we slowly progress, we startle a basking pike. Now we are in a passage only just wide enough for the boat. Tall reeds rise on either hand, and nothing else is visible but the blue sky above. There goes a water-rail, and if we could push the boat in the reeds for a few feet we should find its nest. Then we emerge into the open water of Hoveton Great Broad, and as we approach its lower end the air is filled with the black-headed gulls which swoop close around and deafen us with their cries. Among this labyrinth of reeds and narrow water-lanes and tufts of long grasses, they breed in large numbers. On every little hillock of grass you see their eggs; and the water is dotted with young ones, from the little yellow-and-brown ball of down just hatched, to those fully fledged and just able to fly. It is a sight worth seeing and to be remembered. Yet it cannot compare with Scoulton Mere, also in Norfolk, but out of the Broad district,

where there is the largest colony known in England. As the summer wanes, the birds take their departure to the sea-coast. This end of the Broad is extremely shallow, but the mud is of a great depth. It illustrates the process which is going on year by year in the Broad: the vegetation grows rankly and dies down, and so adds a layer both in thickness and extent to the shallow margin. When, by a repetition of this process, the mud reaches the surfaces, the roots of the reeds and the grasses make it firmer each year, until at last it can be drained and turned into dry land. Some of the smaller Broad's are growing up very fast.

Such is the usual scene of a summer's day. In the winter it is very wild and lonesome, but there are then great numbers of wild-fowl—common and rare.

Of the birds which frequent the Broad's, the heron is the most conspicuous, and it is seen everywhere. There are two or three large and many small heronries in Norfolk, and occasionally solitary pairs nest on the ground in some inaccessible marsh, instead of in trees as is their wont. The great crested grebe may always be seen, and its soaking wet nest be found. If it has young ones, it dives with them under their wings when alarmed, and old and young are sometimes killed with the same shot. The plover and the lapwing are everywhere common. The ruff (the male) and the reeve (the female) of the same species used to be common, but are now rare. The eggs used to be gathered to sell as plovers, and the birds were snared for the table. The male in the breeding season has a splendid ruff—the Queen Elizabeth's collar—around his neck; and this he is fond of displaying for the edification of the female, by marching to and fro on any bare hillock, called by fowlers his "hill." The bittern was formerly common enough, but its nest is now rarely found, and its singular "boom" but seldom heard. In the winter, however, numbers of them come to the Broad's with other wild-fowl, and many are shot. We have not space, however, to enumerate the various species of birds which either breed among or annually visit the Broad's. Enough has been said to indicate their ornithological richness."—BLACKWOOD.

EELS AND EEL CULTURE.

(*ANGUILLA ACUTIROSTIS*.)

Present Knowledge of Eels.—Existence in Oswego (N. Y.), River.—History of the Industry There.—Annual and Aggregate Values of the Industry.—Physics of the River.—Fishing Apparatus.—Sex in Eels.—Spawning Grounds.—Scarcity and Plenty.—Food of Eels.—Eels as Food.—Natural History Notes.

(A paper read by Wm. Hosea Ballou before the Chicago Academy of Science on Tuesday evening, Dec. 14, 1880.)

PRESENT KNOWLEDGE OF THE EEL.

THE eel has long figured as one of the most mysterious of animals. For 2280 years it has been the object of more or less discussion. Aristotle maintained that it "is born of worms produced by mud; Pliny, that it rubs itself against rocks, from the fragments of which young eels are born." Thus from the fourth century before Christ, to the year 1873, the eel has been the afflicted object of all manner of absurd theories from a long list of investigators. In the year mentioned, Dr. Syrski read his observations on the Italian eel, *A. vulgaris*, before the Academy of Natural Sciences at Trieste. Investigations were begun on the 29th of November, 1873, and the second eel opened showed the generative organs of the male. This was the first male eel discovered, the announcement of which was sent to the Academy of Sciences at Vienna. The same investigator continued his observations, rectified many mistakes concerning the organs of reproduction in

the female, and gave much additional information. Later on Prof. Packard "detected the mother cells and Mr. Kingsley observed moving, active spermatozoa." The knowledge of the breeding grounds of the eel was bound up in the following expression, taken from page 447 of Packard's *Zoology*: "It is probable that the eel descends rivers in October and November, spawning in autumn and early winter at the mouth of rivers, and in harbours and estuaries in shallow water." This sentence really expresses all that was conjectured or known about the breeding grounds of the eel up to within a few short months. About the time I was making my observations along the Oswego river, a double article appeared in the *New York Times*, the first producing evidence confirmatory to the theory of breeding in the mouths of rivers and the other, by John G. Sawyer, showing that eels may breed in any soft mud of flowing water. This article was reprinted in supplement 239 of the *Scientific American*. My investigations, I think, will show how near the truth the double *Times* article was.

ORIGIN OF THE OSWEGO RIVER INDUSTRY.

The eel industries of the Oswego river are nearly ten decades old. Toward the close of the 18th century, one John Van Buren erected a log-hut in the woods along the Oswego river, then regarded as the extreme western verge of American civilisation. Following on his track people began to settle around him, making the question of food supply the one most prominent to the hardy pioneers. The river rolled grandly by, uninterrupted by its present dams or the hum of gigantic industries. Its waters were stocked with fish, among which common eels, then extraordinarily plenty, attracted the speculative attention of John Van Buren. He accordingly began a fishery and found a ready market among his fellow neighbours. Thus was begun an industry which has since assumed sufficient proportions to furnish profitable employment for many people. Let me say here that Peter Van Buren, the son, succeeded the original John, and was followed by his son Isaac in the fisheries. The latter lives to-day in a pleasant frame farm house, on the same spot where the first log-hut was erected years ago near Battle Island, famous in history.

HISTORY OF THE INDUSTRY.

There are five great fisheries on the Oswego river and its tributaries, situated at Battle Island, Fulton, Horseshoe Dam, Jack's Rifts and Caughdenoy. Battle Island, where the fisheries originated, has been continuously fished for over eighty years. Mr. Charles Peckham, a lock-tender on the Oswego canal, who now rents the weirs there, gave me the information concerning the fishery, which is here reproduced in brief. The best catch was obtained in 1836, when 800 dols. worth of eels were secured, an equivalent of 11,500 pounds dressed. (The dollar is equal to 4s. 2d.) For several years past the catches have been light, not worth over 200 dols. per year, owing to the water which has never been so low as during 1880. The market for this fishery is chiefly now among the canal boats. Eels are also shipped to Fulton, four miles distant, and Oswego, eight miles away. The following table gives the best approximate result of the fishery for eighty years that could be obtained:

	Value.	Weight.
Greatest haul, in 1836	800 dols.	11,428 lbs.
Least catch, in 1880	200 "	2,857 "

Average per year 500 dols.

Eighty years at 500 dols. per year, equals 40,000 dols. an equivalent of 571,000 pounds dressed eels, or 381,000 live eels. An average value of seven cents per pound is made use of here, which value is generally agreed upon by all fishermen.

FULTON.

At Fulton Lewis Fuller has fished since 1846. The river has

been fished here for fifty years. The following statistics were secured at this point:

	Value.	Weight.
Greatest catch, in 1862	1,400 dols.	20,000 lbs.
Least catch, in 1880	200 "	2,857 "

Average 800 dols.

Fifty years at 800 dols., is equal to 40,000 dols., an equivalent of 571,000 pounds dressed eels, or 381,000 live eels.

The largest catch ever made at this point was 1150 pounds in one night, an equivalent of 800 live eels. The number of live eels is obtained in this manner: an average eel weighs two pounds. One-third of this is lost in dressing. Now, to the number of pounds of dressed eels add one-third the weight and divide the result by two, which will give an approximate idea of the number of live eels. The markets for Fulton eels are Rochester, Buffalo, Syracuse, Oswego, Chicago, and Fulton. Chicago receives its supply mainly from eels shipped to Syracuse, the greater shipments being in cold weather.

HORSESHOE DAM.

Horseshoe dam is situated four miles above Fulton, and is fished by Lewis and Levi Montague. It has been fished for 65 years, and has an average value of 850 dols. per year in its fisheries—an equivalent of 55,000 dols. for that length of time, 790,000 pounds of dressed eels, and 475,000 live eels.

"JACK'S RIFTS."

"Jack's Rifts" are situated on Seneca River about four miles up from its junction with the Oneida River, which streams together, combine to form the Oswego River. It is a small fishery which has had an existence of 25 years. It is the property of James Devlin, and I understand, has had an average value of 300 dols. per annum, an equivalent of 7500 dols., 110,000 pounds of dressed eels and 72,000 live eels.

CAUGHDENOY.

The most important of these fisheries are situated at Caughdenoy on Oneida River, twelve miles from its junction with the Oswego River. They have been active for 50 years. There are some 20 men at work here day and night, who run 10 weirs. One firm is composed of Jefferson and Nell Hopkins, David Buss and Frank Palmerton. It has operated for 22 years. Their largest catch was in 1874, when 1000 dols. worth of eels were secured. The fishery for the specified time has produced 15,000 dols., an equivalent of 160,000 pounds of dressed and 107,000 live eels. The markets for these fisheries are Fayetteville, Syracuse, Rochester, and Amsterdam. William Rhines has fished for nine years here, for which he has received 2000 dols., an equivalent of 22,000 pounds of dressed and 14,000 live eels. Messrs. Guard and Van Antwerp have fished for 14 years, for which they have obtained 5000 dols., an equivalent of 55,000 pounds of dressed, and 36,000 live eels.

The following table shows the approximate value of the combined fisheries for Caughdenoy:

	Value.	Weight.
Known value for 22 years	22,000 dols.	314,000 lbs.
(equal to 158,000 live eels)		
Approximate value for previous years	28,000 "	400,000 "
(equal to 170,000 live eels).		
Total	50,000 dols.	714,000 lbs.
		475,000 live eels.

The following table shows the value and extent of the entire industry of the Oswego River:

	Value.	Lbs. eels	No.
	dols.	dressed.	live eels.
Fishery at Battle Island for 80 years	40,000	571,000	380,000
Fishery at Fulton for 50 years	40,000	571,000	380,000
Fishery at Horseshoe Dam for 25 years	55,000	790,000	475,000
Fishery at "Jack's Rifts" for 25 years	7,500	110,000	72,000
Fishery at Caughdenoy for 50 years	50,000	714,000	475,000
Total	192,500	2,756,000	1,782,000
Average per year, 52 years.	3,500	55,000	35,000

PHYSICS OF THE RIVER.

The physics of the Oswego River has been a peculiarly interesting study to me. I have already covered the subject in an article published in the *American Naturalist* for February, 1880, entitled the "Water Sheds of the State of New York," from which I take the following information:

"The most powerful water shed of the State is drained by the Oswego River. Its area contains no less than 7000 square miles of territory. It comprises the well-known chain of lakes, some of which are of considerable size and importance—the Oneida, Cayuga, Seneca, etc., amounting to over 400 square miles of lake surface. Besides being in themselves natural reservoirs, the state has further improved Seneca Lake so as to regulate the periodical flow of the water. The average flow of the water is thus secured at about 600,000 cubic feet per minute. 20 miles above the mouth of the Oswego River is Three River Point. From this place, down stream, there is a fall of water amounting to 75 feet. This space is taken up by seven dams erected and maintained by the State. Of these, two are situated at Oswego, covering a fall of 40 feet. These dams, accord hydraulic privileges equal to 25,000 horse power. But a moderate outlay is required to keep the flow in the river near the average for the year. 150,000 cubic feet of this water supply is in actual use in Oswego, where the canals are provided for the reception which furnishes 82 runs of first-class water, and 37 of the second class.

"Two dams are situated at Fulton with 20,000 horse-power. At this point the water privileges are easiest available, although Oswego has the greater representation of industries.

"The Oswego River watershed produces clear cold water, which is perfectly under control of man, no matter what the circumstances or exigencies. The river bank forms a line teeming with industries, with millions of dollars invested. This water supply never endangers the lives of citizens or encroaches on their property, but on the contrary, affords a roadway for inland navigation through the canals which it feeds."

(To be continued.)

THE PISCATORIAL SOCIETY.

THE half-yearly, or what may be more properly designated, the annual general meeting of the members of this Society, was held in the Club-room, Ashley's Hotel, Henrietta Street, Covent Garden, on Monday evening last. Mr. Thomas Huggett being unanimously voted into the chair. The attendance of members included Messrs. T. Spreckley, F. G. Pearce, W. B. Adlington, Alfred Jardine, T. R. Sachs, W. H. Brougham, James Lander, H. Grey, F. H. Lemann, B. Perelli-Rocco, J. Knechtli, H. B. Eyre, H. J. Inderwick, B. Slater, E. Frost, C. C. Capel, C. P. Wheatstone, G. Hill, R. Fenning, James Patisson, J. A. Nicholay, J. Christie, E. Foreman, E. Wilkinson, D. Goodger, J. G. Andrew, W. Mann, Dr. Thomas, T. Dixon, M. H. Blamey, J. Hiersch, G. Bates, Harrison, Sparrow, J. F. Lovelock, &c. The business commenced by Mr. James Lander (Honorary Secretary) reading the minutes of the last half-yearly meeting and the last weekly meeting, which was confirmed. In the absence of Mr. T. Gillatt, the senior auditor, from indisposition, Mr. J. Patisson, his colleague, produced and read the audited financial statement of the treasurer. From this it appeared the receipts in subscriptions and entrance fees including a balance of £6 rs. 8d. from the previous account made a total for the half-year of £57 10s. 8d., and the expenditure left a balance in hand of £6 os. 8d. There were £11 11s. od. due in arrears, of which £6 6s. had already been paid. In the savings bank the sum of £54 5s. 8d. was placed to the credit of the Society. Mr. Patisson paid a high compliment on the manner in which the accounts were kept. Mr. F. G. Pearce, after referring in very graceful terms to the

arduous duties performed by the honorary secretary, which occupied much valuable time and expense, proposed that Mr. James Lander be requested to accept of the sum of £20 as a compliment from the Society, and as a slight acknowledgment of his most valuable services, which being seconded by Mr. J. A. Nicholay, was enthusiastically carried. Mr. Lander in returning thanks, observed he had been now seven years in office, and if the members could find any one better for the position, he would willingly resign (loud cries of "No, no.") The meeting then proceeded to the election of officers for the ensuing year: Mr. F. G. Pearce was unanimously elected Treasurer; Messrs. T. Gillatt and James Patisson as Auditors; Mr. James Lander as Honorary Secretary; Mr. H. Gray as Librarian. The old Committee were re-elected, with the exception of Mr. L. Cottam, who not having attended the required number of meetings, was not eligible for re-election and Mr. Thomas Huggett was unanimously elected in his place. The next business was to fix the date and place for the annual dinner. It was thereupon agreed to take place on Wednesday, February 9th, and after some complimentary remarks on the previous dinner, it was unanimously resolved to hold it as usual in the Prince's Saloon at the Holborn Restaurant. A letter was read from Mr. Arthur Ottway, M.P., accepting the invitation of the Committee to preside on the occasion, and Mr. Thomas Huggett, who had taken the chair at the summer dinner, was very cordially selected as vice-chairman for the annual dinner. It was agreed to invite as guests on that occasion, Sir Henry W. Peek, Bart, M.P.; Mr. A. J. Mundella, M.P.; and Mr. McLaren, M.P., in addition to those who were usually invited. Messrs. F. A. Lemann, Alfred Jardine, B. Perelli-Rocco, C. P. Wheatstone, and James Lander were appointed Dinner Stewards. Several notices of motion were given, one being from Mr. Alfred Jardine on the earlier commencement of the weekly meetings, as the hour of nine o'clock, and frequently after, when they began, gave no chance of those members more frequently attending who resided at from 10 to 15 miles distance from London, and who would, he was sure, attend more regularly if the hour of seven o'clock was fixed for the commencement of business, and when that was over, those who liked to spend a longer evening would have the opportunity of doing so. Mr. Thomas Spreckley fully concurred in Mr. Jardine's ideas, as he, for one, would come oftener amongst them if the time for business was fixed at an earlier hour. Mr. H. B. Eyre expressed a similar opinion. The usual Club Prizes were voted for the coming season. A vote of thanks to Mr. Huggett for his able conduct in the chair terminated the business portion of the proceedings.

ANDOVER AND WEYHILL HORSE COMPANY
(LIMITED.)

WE beg to call the attention of our readers to the announcement details to be found in our advertising columns of the important sale of hunters of the Andover and Weyhill Horse Company (Limited), which will take place on Tuesday next at the Company's stables at Cricklewood. The list comprises 40 first-class hunters, many of which are weight-carriers of great quality, and several perfect hunters, suitable for ladies. We may mention, for the information of those of our readers who are not aware of the fact, that Cricklewood is 3½ miles from the Marble Arch on the Edgware Road, and close to the Cricklewood station on the Midland line, King's Cross (Metropolitan) station. The sale is fixed for the 1 o'clock, under the auspices of the well-known auctioneers, Messrs. W. and S. Freeman, Aldridge's, St. Martin's Lane.

MRS. F. Y. BROCAS, Artificial Fly Dresser, 4, Mill-street, Conduit-street, Hanover-square, London, W. A stock of best flies always on hand. Flies made to pattern. Lessons in fly making given.—[ADVT.]

RIVER REPORTS

MID-THAMES.

"To be, or not to be,
That is the question."—SHAKESPEARE.

Whether we are going to have any more decent fishing in the Thames this season or not, that is the question. As I write there is every indication that good sport may certainly be anticipated, for the flood has rapidly disappeared, and the obstreperous water is once again confined within bounds. The colour of the river is excellent, and by the time these observations are in print I should say the river will be *sans* flood, *sans* mud, *sans* everything bad—in short, perfection. The angler who now knows how to go to work will be almost certain to gain the reward of merit. Not anything worthy of note has been done during the past week, but something worthy of report in the way of netting the meadows below Henley. I refrain, however, from further comment until more minute facts are before me, when the evil-doers may be sure their sins will find them out.

THURSDAY EVENING.—River dropping into splendid angling. Weather cold and dry, with a strong easterly gale. MARLOW BUZZ.
January 6th, 1881.

Thames (Goring).

The water is getting in good order for jack and perch. Prospects better. By Sunday, water will be in first-rate order again if it keeps fine. Nothing doing. All we want now is some gentleman to come, now the water is getting right.—JOHN RUSH.

Thames (Richmond).

The river is getting in fine trim, and the water is a splendid colour; there is a little too much stream, but by the time this gets in print things will be all right. Harry Wheeler was out on Tuesday and got 12 dozen of splendid dace, he hadn't one dozen of small ones if he had wanted them for bait; he was only out three hours so they had good sport. I went out for a couple of hours but the wind was blowing enough to cut your head off, so I turned it up with 3 dozen of fine dace. The dace are very large, and there will be some good sport next week with the bream if the rain keeps off. The water is a little too high now, but will be all right by Saturday, as it is one foot lower than it was yesterday.—J. BUSHNELL.

Thames (Windsor).

Water has fallen considerably within the last twenty-four hours, and is clearing fast, though it may not be in the best of condition till well into next week. Still there is a chance for bank anglers, as it has left the tow paths except in the lowest parts, and by Sunday will not be too thick for gentles or paste, though worm will be taken by the heavier roach for some days to come. Owing to the very high state of the river very few anglers have been out, and I only know of small takes of roach ledgering with the tail end of lob during the week; but last week, though too late for my report, Paice, of Etonwick, fishing with Mr. Millans, of Kensington, had one day 6 perch with tail of lob, largest 2 lb. $\frac{1}{2}$ oz., 9 roach, and a pretty trout between 4 and 5 lb, which was duly returned to Surly Hallpool. Next day with the same gentleman he had 12 roach, 3 barbel, 9 dace, 9 gudgeon, and a trout of 1 lb., which was duly returned.—B. R. BAMBRIDGE.

Colne (Thorney Broad).

In first-rate order for angling. Every prospect of good fishing during the coming week. Weather fine. Mr. Hawkins has had a fair show of roach from $\frac{1}{2}$ lb. to 1 $\frac{1}{2}$ lb. in weight; T. Hawkins, jack, largest about 4 lb.; Mr. Faulkner, roach and dace. Other anglers have been out, and had a fair amount of sport. There is every prospect of good trout-fishing in the coming season; there are more trout up to spawn than we ever remember seeing before. Anglers wishing to subscribe to these waters should apply to E. Godfrey, proprietor.—E. GODFREY.

Ouse and Ivel (Blunham).

These rivers are in fine condition for angling, and we are expecting several gentlemen home with some fine bags of pike from the Ouse to-night.—T. ELLIOTT.

Exe and Canal (Exeter).

The weather during the past fortnight having proved very unsuitable for fishing in the river, most of our city anglers have lost no time in getting their implements in order for that kind of fishing as soon as the regular season opens, and all those who have and did use "Strawson's line-preserver" at the end of the past season must be very pleased at the feel and appearance after some few weeks' holiday, especially in such a damp atmosphere as we have had during that time. One dressing will preserve a line for seasons, which I have well proved during the past ten years. The result of last week's fishing in the Canal was so far satisfactory, as the quantity of catches effected proved, although, owing to its being Christmas week, very few rodsters were out. Several nice pike were taken, also a brace of carp, weighing over 10 lb., and a few perch, which were not over fine. Unfortunately, as a rule, they do not run large in the Canal. The net fishermen in the lower part of the river, from Topsham to Exmouth have done simply nothing during the floods, but, the herrings having returned to the estuary again, they are now having some fine hauls of fish, which are much superior in quality as well as in size to those taken some weeks back, and were selling on Saturday, January 1, at £2 per 1000. All the weirs, from Salmon Pool to Cowley Bridge, have presented a grand spectacle of late, and salmon are still coming up, and the run on Sunday and yesterday has been immense, which caused numbers of persons to stop and watch them shoot into

and through the heavy waters over the Black Aller and Head weirs. I have not heard of a single poaching incident, or seen any salmon offered for sale, which we generally do at this particular season of the year (Christmas). Of course, there is little danger to be apprehended, first, because the waters are too high, and, secondly, because the fish are all on the run; but a little later on, when the river is again lower, and the fish are on the spawning-grounds or leaving it, then it will behove the bailiffs to be on the *qui vive*. I believe the coming season will compare favourably with any of its predecessors, though, as a rule, it is a very late one.—FRANK GOSDEN.

Trent (Newark).

The water is rapidly fining down after the very heavy floods of last week. It is still a little higher than ordinary, but not in bad condition for chub and pike-fishing, the prospects according to the state of affairs to-night (Thursday), look pretty favourable. Weather sharp and clear, but wind in a nasty quarter, viz., East. If no alteration in weather and water takes place, I think that by the time this is in print, anglers will have a chance of a little sport among the chub and pike. Try the chub with pith and brains, or perhaps a nice bunch of cockspurs may fetch them, but I shall prefer pith, especially if these frosts continue; pike-fishers should try all the pools and backwaters, and every snug corner that they think is likely to contain a fish, for I believe those fish will be inclined to feed, livebaiting or spinning. Roach, dace, and bream, will perhaps take the little cockspur worm, but I should certainly prefer chub and pike-fishing this next week if there is no alteration.—THE TRENT OTTER.

Trent (Nottingham).

The recent great flood we were visited with at the end of last week went away very rapidly, and, the weather changing to something more favourable than it had previously been, the water by Tuesday morning got into good condition for bottom-fishing; and considering it was the week after the Christmas holidays, a good number of rodsters were soon prepared to go out, as Trent fishermen know perfectly well if they allow the favourable chances to pass by during the winter months, they had better stay at home. However, one party went to Burton-on-Trent and another stopped short at Willington, and at both places the fish were found ready to feed at worms, and several nice samples of roach and dace were brought down, one angler having a 4 lb. bream among his fish, and another had several nice perch in his basket. The taking of the latter showed that the temperature of both air and water must have been good, for it is seldom perch bite well in frosty weather. On the following day two capital baskets of roach were brought up from the neighbourhood of Ratcliff, and I am of opinion that anglers who are fond of winter fishing should watch the water in this locality, for they will not find better swims within miles of Nottingham. Then came another sudden change; the mercury went down in a few hours almost to freezing-point, which put a check on the worm fishers; but, the water improving, let in the anglers for chub and pike. The former, using scratching for bait, managed to capture some nice chub, taking the precaution to select swims from five to six feet deep. The pike-fishers did not get on very well, though I might say, according to the present state of the weather, they will have a very good chance of sport long before this letter is in print.—W. BAILEY.

Wye and Derwent (Derbyshire).

Both the above rivers have run down wonderfully since my last report, especially the Derwent, and the mild weather we have had during the week has been causing a fair quantity of anglers to turn out on the Derwent bottom-fishing and pike-fishing; but the river being of a nasty white, milky colour, with snow broth in the river, has been causing the fish to feed but middling, which they generally do in all our Derbyshire streams when the snow broth is in the rivers. It seems to quite take them off the feed. There has been a few grayling, roach, dace, and perch killing, with small branding worms for bait. The pike-fishers have been killing a few fish of small size with small dace for bait, both trolling and dead gorge fishing. The Wye will be all right for fly-fishing by next week. The claret body, bumble, furnace, and dyed hackle flies are the best kind the angler can use for this time of the year. Our rivers are early spring and late autumn rivers, and I recommend anglers to lose no time in trying their skill while this beautiful fine mild weather continues, as grayling generally rises sure at this season of the year, and now they are in the best of condition.—GEORGE JAMES EATON, Starkholmes, Matlock Bath.

The Yore (Yorkshire).

I regret to say that angling prospects are still anything but bright in this district, owing to the continuance of high floods in the main rivers, which will have to subside before anything can be done in the way of grayling fishing. I am living in hopes, however, as to-day a sharp frost has set in, and under its influence the water will rapidly run down, when I expect to bring a few fish to basket either with fly or the little red worm, and also to give your readers a more encouraging account of sport generally.—FRANCIS M. WALBRAN.

TO FISHING-TACKLE MAKERS.

WE earnestly advise all who make fishing-tackle or any article, used by anglers—punts, boats, &c.—to at once take space at the National Fisheries Exhibition to be held at Norwich in April. It will be by far the best exhibition of the kind ever held in these islands, and will attract an immense concourse of anglers. Exhibitors are allowed to price their goods and distribute catalogues. Particulars and prospectuses can be had of the Hon. Secretary, W. Oldham Chambers, Esq., Lowestoft.

TO ANGLERS.—W. J. Cummins, Fishing Tackle Maker, Bishop Auckland, is now prepared to forward to anglers his Illustrated Catalogue, which is not only a Trade List but is interspersed with practical hints, useful directions, and valuable information gathered by the river-side from twenty years' experience. The stock consists of his unrivalled Salmon, Trout, Grayling, and Pike Rods, Lines, Reels, Baskets, Artificial Baits, Fly-books, Landing Nets, Gafts, and last, but not least, his celebrated Trout FLIES, which for killing purposes stand unequalled. Every article kept in stock is of the very best description.—[ADVT.]

GEORGE JAMES EATON, of Starkholmes Matlock-Bath, Derbyshire, respectfully invites Noblemen and Gentlemen to try his standard FLIES for the present season. No flies sent or made up but what he himself has proved sure killers. A trial is all that is required from gentlemen who can fish to prove whether they may be genuine or not. Patronised by some of the best fishermen of the day. All flies dressed on the best Kental hooks. Prices: Point Flies, 2s. 6d. per Dozen; Dropper Flies, 2s. per Dozen. Orders punctually attended to.—[ADVT.]

THE CULTURE OF CARP AND CONSTRUCTION OF PONDS.

BY RUDLPH HESSEL.

PART III.—CONTINUED.

THOSE who never saw the fishing-out of a carp pond can scarcely imagine the beautiful sight of so many thousand fine fishes, fat and well fed, raising their high, broad backs and thick, puffy lips above the water, their heads side by side, all being nearly of the same size, weighing from four to five pounds, their bodies closely pressing against each other, looking like an immense herd of sheep, imprisoned in one large net, upon a circumference of 3000 to 4000 feet. Closer and closer the circle is drawn around them, until its extent measures only about two acres, when they are caught by thousands, weighed in lots of 100 pounds, and then they are placed in the market ponds. The pikes, which have reached an almost equal weight, are put into pike ponds. It requires often two or three days to weigh the fishes, ponds of 1000 to 2000 acres area containing on an average 200 tons of carp and 20 tons of pike; tench and other fish not included.

I assisted once at the fishing-out of one of these ponds, which took place in the neighbourhood of the town of Guben Pleitz, province of Brandenburg, Germany. The pond was the property of a

plants (*Festuca fluitans* and *phelandrium*), for the spawners and the young fish, and also places, eight to ten feet deep, for larger fish. If such a pond is to yield some profit, it must also be particularly rich in food. A natural pond may be used, or, if such a one is not found, it may be artificially constructed. It is indispensable, however, that such a pond should have the same depth of water all the year round, and it should be so arranged that even the last drop of water can be let off, as occasionally even the smallest fish, measuring only two or three inches in length, must be taken out. Such "mixed ponds" must likewise have "collectors" and "collector-ditches." It will also be found very useful to construct a sort of hatching-place on some flat and sunny place, near the bank, viz., a so-called cut in the bank, measuring 40 to 100 feet in length, and 30 to 50 feet in breadth, and having a depth of five inches to one and a half feet. This cut should be thickly planted with the above-mentioned aquatic plants, and ought, so to speak, to be the only place in the pond where carp can ascend from the depth in order to deposit their eggs conveniently and engage in the spawning process.

As soon as this has taken place, the entrance to this cut is closed with a net, so the eggs cannot be eaten by the fish. This net may be removed when the young fish have come out of the eggs, but it is preferable to leave it in its place for

competent culturist and valued friend, Mr. Thomas Berger, of Georgenhof, near Cottbus-Peitz. The ponds in which this gentleman carries on carp-culture exceeds the extent of 6000 Prussian acres. The pond which was fished out at the time I speak of was but a small one, not more than 200 acres in size, yet to my surprise I found that the greater number of fishes were fine specimens of about three pounds' weight, though they were but in their second year, having weighed no more than one and a quarter pounds five short months before (the fishing-out took place at the beginning of October), and they had attained to this great weight in a comparatively very limited space of time. Several establishments of this kind are located in that district, and they commonly belong to some large princely domain (Crown property). They are, like all large fisheries, admirably managed, and the results are most satisfactory.

6.—MIXED CARP-CULTURE.

We have so far spoken of carp-culture, according to the different age of these fish, in special ponds (hatching, breeding and carp ponds), termed "class-culture" in Central Europe. We must now speak of another method, pursued in so-called "mixed ponds," in which there are fish of all ages, from one year to eight to ten years.

Not much can be said regarding this method, as there are no hatching or breeding ponds, but only one pond, which, however, must combine all the characteristics of the class-ponds. It must therefore have shallow places overgrown with grass or aquatic

some days, that the young fish may be able to feed for some time undisturbed.

Explanation of Diagram.—A is the pond, B the cut, which,

Fig. 2.

BA Cross section of pond through breeding place.

though directly connected with the pond, is in reality nothing but a hatching-pond, such as has been described above. In order to

eggs which it impregnates will produce spotted fish, having at least a silvery streak $\frac{1}{4}$ to $\frac{1}{2}$ inch long and $\frac{1}{8}$ inch broad, between the caudal and the dorsal fins. Such bastards (the cross-breeds of gold-fish and *carassius* also resemble them) do not grow larger than gold-fish, and have as many bones. They are unfit for table use and entirely unsuited for ornament, as they are neither genuine carp nor gold-fish, and are disagreeable objects in the eyes of the scientist or connoisseur. If such fish are not removed immediately the consequence will be another cross-breed during the next spawning season, for such a hybrid spawns like the gold-fish, when it is a year old, and the breed of carps would degenerate still more. It is best to kill such worthless cross-breeds at once, as they are apt to give great trouble.

I would embrace this opportunity to impress upon every carp-turist who intends to make breeding-experiments with any carp, the importance of having if possible only one of three above mentioned kinds of carp, unless he can have every kind in a separate pond. Thus, the common carp (*Cyprinus carpio communis*) should never be placed in the same pond with the "mirror-carp" or the "leather, or naked carp" (*Cyprinus carpio alepidotus, coriaceus vel nudus*), nor should the two last-mentioned varieties ever be in the same pond. Cross-breeds would invariably be produced, and in such a manner that one would have neither genuine common carps nor genuine mirror or leather carps, but a cross-breed of all the three varieties. Not even when quite young and not yet capable of spawning should these varieties be put together, because, even if they are kept strictly separate during the spawning process, the young fish would never have the sharply-marked characteristics of their variety as regards form and colour, but would approach nearer to the "mirror carp" and the "common carp." The carp has a striking tendency, when living with other varieties, to approach the primitive form of the common carp, and finally to be merged in it. These beautiful varieties should therefore be kept strictly separate; lack of ponds or any other reason should never induce people to mix them.

If the breeding-experiments are to be accompanied by good results, a pure variety should be selected, and the finest and best milters and spawners, showing strongly all the characteristics of their variety should be procured, and the experiments will be crowned with success.

I must return to the so-called "mixed culture," by mentioning that it is not to be recommended. In Central Europe it is never practised by scientific pisciculturists but only by small operators mostly in so-called "peasants' ponds." This method does never yield a certain and truly profitable result.

7.—FEEDING THE CARP.

In conclusion I will make some remarks on the feeding of carp in close ponds. It is not every natural pond which is a good pond, having the essentials of a good soil at the bottom and capable of producing sufficient food for the fish. If these conditions are wanting, the fish must be fed. This is as a general rule only necessary in ponds with sandy bottom without any clay. As I have said before, I am *not* in favour of feeding fish, as my standpoint is that of the rational culturists sharing the opinion with most of the prominent pisciculturists of the Old World, that the carp should find its own food in the ponds.

If, however, the nature of the bottom demands artificial feeding, or if suitable food can be had at a remarkably cheap price, the feeding should be done with great caution. Never feed in one and the same place; even if the pond be very large, distribute the food in different places near the banks. If the food is always put in one place, or even if it is distributed over two places, the carp will stay in the neighbourhood of these places, will become languid, and instead of scouring the other parts of the pond in search of food, will remain at the bottom. It will even

have a complete system of ponds, nothing would be required but a "breeding-pond."

In Europe this method was generally adopted by beginners in carp culture, commencing with a mixed pond, and gradually proceeding to the small "hatching-pond," and finally to the "breeding-pond," as the great advantage of separate ponds for the different ages of fish over the "mixed pond" system soon became evident.

In such a "mixed-pond" no pike must be kept for regulating stock, as may be done in a class-pond, for all the small fish would then soon be devoured. It must be made a strict rule that, with the exception of the tench (*Cyprinus tinca*), no other kind of fish, however harmless, is allowed in the pond. The tench is related to the carp, but it spawns four to five weeks later, so there can be no danger of cross breeds.

Great care should be taken that no gold-fish (*Cyprinus carpi auratus*) or bream (*brama*) get in the pond, for these fish would soon mix with the carp and tend to degenerate the breed. Such fish should therefore be removed or killed at once. The gold-fish, especially the milter, swims in spawning-schools like the carp and at the very same season. It thus spoils the eggs of the carp, as all if surrounded by the richest food, grow fat, but never have any firm flesh; nor will it ever grow much in length, as the somewhat phlegmatic fish does not get the exercise which favours its growth.

Never give them much food at one time, but by degrees, in small quantities, never during the day, but either early in the morning or in the evening. During the hot season only feed them late at night, because the carp, if it has eaten sufficient in the morning, will remain at the bottom all day, while during the higher temperature of the water it is necessary for its health that it should swim round and get a change of water. It is therefore useful to place in ponds containing large carps a limited number of pikes which, however, must be smaller than the carp. The carp fears the pike and flies from it. If there are pikes in the pond, the carp will get more exercise and will seek natural feeding places, whither on account of its innate sluggishness it would never have gone.

Pond-carp are accustomed to other food than the river-carp. The former confine themselves to worms, larvæ, and plants, while those living in streams find all sorts of animal and vegetable refuse; these latter can also stand a greater amount of food, as the current naturally makes them take more exercise, thus increasing their appetite. It is different with the pond-carp; if you give it too much food, it will not take any more than is necessary to satisfy its hunger; the remnants will remain at the bottom, and if their quantity be considerable, they will spoil the water. If these remnants are chiefly animal refuse, as flesh or blood, fungi will grow on them, and will then produce, as with the salmon and trout, diseases of the skin, the gills, and in the case of the carp sometimes internal diseases.

(To be continued.)

GREGORY'S SPINNING BAITS.—"The Gregory," the "Flexible Cleopatra," the "Oxford," and the "Colorado," pronounced by all Anglers and the Press the best baits invented for salmon, trout, pike, and perch. To be obtained from all respectable fishing-tackle shops in the world, and wholesale from Messrs. S. Allcock and Co., Standard Works, Redditch. Flattering testimonials speaking of the efficiency of the baits have been received from the Right Hon. John Bright, M.P.; Mr. William Bailey, Nottingham; the Rev. E. C. Holt, Teddington; Sir William Calder, Kingston-on-Thames, &c. Gregory's registered Archimedean spinning tackle for pike and trout, now ready, is pronounced by the press the best ever invented. For use with dead bait. The tackle is complete in every respect, and can be adjusted to suit bait of any size. Has been tried with remarkable success.—See that the name "Gregory" is impressed on the Archimedean fins, as inferior imitations are offered for sale, and people are thereby disappointed and deceived. Address, James Gregory, Vyse-street, Birmingham.—[ADV'T.]

ANGLERS should always be provided with something to take away the swelling and poisonous effect of the bites of insects. They should also have with them something to apply to a cut or sprain. Pond's Extract reduces the swelling and inflammation, stops bleeding and pain, and hastens the healing process in case of any wound or sprain; and it has no equal for application to the bites and stings of insects. Therefore never go on a fishing excursion unprovided with a bottle of Pond's Extract. It is for sale at all chemists, at 2s. 3d., 4s. 6d., and 8s. 6d. per bottle.—[ADVERTISEMENT.]

PIKING IN PRIVATE WATERS.

WE had been jack-fishing all day the back end of last autumn at Hampton, under the care of the reputed most celebrated fisherman of the place, but without any luck. When we started in the morning we were assured by our lively friend that it was a "day of days"—wind right, water right. "Didn't he know where some 20-pounders lay?"—of course he did. "Had he not fished the water for years, and his father before him, and did not Mr. Jones only last week get a 16-pounder just under that bed of weeds?" where we subsequently pitched; but Mr. Jones had evidently taken all the inhabitants, for we had no sign of a run. As we were paddling back in the dusk, disappointed, but, like true sportsmen, not disheartened, our fisherman, full of beer and spirits, nothing daunted, and having the consolation of knowing that we unfortunates had to part with the usual half-sovereign. Resting awhile on his oar, our cheerful sportsman grunted, "Well, I can't understand it," (as a fact, they never can understand it) "must be the water is too cold; but there, after all, the Thames is not what it was; but, gents, I know a place not a hundred miles from here where the jack are so thick that I've seen them in summer time lying like logs of wood on the water, and a fact, I assure you, one night when I was coming away, I heard them barking like dogs." Amused at our voracious friend, 'twas so much like the rosy prospects of the morning, and guessed it was an attempt to lure us to have another day with him; but all our endeavours to find out the place were unavailing, he wouldn't give us the necessary fixture until we warmed his heart with a glass of grog. At parting, he said, "You know, gents, when you are ready to fish that bit of water at Kempton let me know, and I will get some baits ready." Thinking the matter over, we wended our way to the station, and finding we had some time to wait for a train, we adjourned to the Railway Hotel, and from the friendly landlord made inquiry for this celebrated water. He informed us that he had the letting of the water, and the charge 5s. each. No much, we thought, "if the fish were lying like logs of wood on the water." He did not quite corroborate the statement of our fisherman, but gave us clearly to understand that it was a wonderful fishy spot. We made up our minds to give it a trial, though personally I am adverse to private waters, as, in spite of their vaunted preservation, there is no water so much fished and often netted as your so-called "preserved water." However, one fine November morning saw us at Hampton, obtaining the necessary permission, and with a bait-can full of fine Thames dace and gudgeon. On leaving the hotel you turn sharp to the left, and down a pretty lane with high banks, you come to a gate which, leading across a meadow, brings you to the far-famed Kempton Water. Wading through a small wood filled with beautiful firs, and a thick undergrowth of fine shrubs, you come soon on the lake with its dark silent waters, giving the impression of great depth and the home of monsters. In the centre a small stand with tall poplars and willows, the sides covered with shrubs, the home of the kingfisher and moorhen. It is a wonderfully fishy spot, and our hearts beat high as we gazed upon the beautiful lake, and anticipated a big day's sport. Getting our tackle ready, we had soon a lively dace on snap-tackle, and a good cast sent him some thirty yards; rigging up a paternoster with a lively gudgeon, we soon had that at work, not forgetting the landing net in case of an accident. We waited and waited, but no sign of a fish—the baits well at work, evidently they were not on the feed. After some time we determined to try the other side of the lake, but no, not a run. We made for the boat-house, and fortunately finding a small punt, we soon had our tackle on board, and then went in earnest to find the "logs." Somewhat to our surprise we found the water was very shallow,—not more than two or at most three feet deep. Altering

our floats we tried in the most likely spots, but could not get a run. We soon left the punt, intending to try the stream which empties itself at the far end of the lake. We soon got to work here, and were rewarded in a few minutes by a run. Giving him a sufficient time, I struck; and soon had a pretty fish of about 5 lb. in the net. "That's better," cried my friend. "And by Jove! I've a run, too!" and soon we had Master Johnny the second on the bank. This fish was not quite so heavy as mine. Moving higher up the stream, where the river slightly widens, and opposite what was then a haystack, we got another fish. We found the water very shallow, full of weeds and dead leaves. The river at no point is more than 20 feet wide and 3 feet deep. We found it necessary to fish very shallow, and even then the baits would work for the bottom, as though instinct taught them that their natural enemy could not strike when well on the top of the weeds. We got two more fish at the same spot, and, working up stream, close by a small plantation, we had another good run. This gave promise of a fine fish, but, in striking, the gimp gave way, and we had the mortification of seeing our fish rush upstream with my trace and a good piece of steel to remind him of the danger he ran while taking that too-seductive dace for his lunch. The stream is a portion of the river Colne, a continuation of the Queen's River, and, I believe, finds its way from Hounslow. If it could be properly cleansed, and a few good holes made, some fine jack might be reared there, and with prospect of good sport. In the summer time a quantity of bream are taken in the lake and some roach. A good keeper, who would devote some time to the care of the water, is wanted. We tried the lake again before leaving, but had no luck. I am of opinion that there are few, if any, jack in the lake. Although we did not find the jack "lying like logs on the water," we were not dissatisfied with our day's sport; for we had some nice fish, all in splendid condition. We felt that such a lovely spot should be under the care of some fishing club taking an interest in the rearing of fish, and stocking the water, with proper supervision as to size, &c. It should make one of the grandest spots, either for winter or summer fishing, within such easy distance of town. In summer time a glorious place for a picnic, where members and their wives may spend many a happy hour, and amidst a truly pastoral scene, where the meadows have that verdure which Londoners enjoy as a feature of English landscape. The lake, with its lovely firs and dark waters, reminding one of some Highland loch—the island, with its poplars and willows—the charm of silence, only broken by the cry of a pheasant in the coverts, or as some startled hare rushes across the open. It is a pleasant scene, from its verdure and pure waters for the lovers of an innocent amusement.

Packing up in the dusk, we made for the inn, where we met the pleasant landlord, and realised for ourselves:—

"Whoe'er has travelled life's dull round,
Where'er his stages may have been,
May sigh to think he still has found
The warmest welcome at an inn."

INTERCHANGE OF FISH-SPAWN BETWEEN AMERICA AND GERMANY.

A DESPATCH from New York gives some interesting information respecting the interchange of fish-spawn between America and several countries of Europe—more particularly Germany—which has been inaugurated by the leading pisciculturists of the various nations. The North German Lloyd steamer "Donau," sailed from New York on Christmas day, bound for Bremen with a consignment of 250,000 eggs of the white fish of the great American lakes, the shipment being made by the President of a Special Committee of the Board of United States Commissioners of Fisheries to the German Fisheries

Association of Berlin. The eggs come from the United States "hatcheries" at Northville, Michigan, where they were packed by Mr. Frank N. Clark, the superintendent, and despatched by express to New York. On arrival there they were repacked under the direction of Mr. Frederick Mather, of the popular American sporting journal *Forest and Stream*, and sent on board the "Donau." In return for the consignment, the Berlin Association will send to New York a collection of the different species of eggs of fishes peculiar to Germany, which it is believed can be advantageously introduced into the waters of the United States.

It is expected that amongst other species, the Berlin Association will send the eggs of the saibling, a very large and handsome species of lake trout, found in deep cool waters and highly esteemed for the table. There is nothing like it in the United States, but the fish is known in England as the charr, but here, however, it is seldom found to exceed half-a-pound in weight. In the deep waters of Lake Constance it is often taken of the weight of 25 pounds, and it is believed that in the American lakes it will thrive as well as in Germany. The previous shipments to Europe of American fish-spawn have been large and proved successful. Some time ago as many as 700,000 eggs of the Californian salmon were shipped to Germany, France, Holland, and England, by Mr. Mather, above alluded to, and arrived in good order, but sufficient time has not elapsed to make it possible to judge whether the species sent out will thrive or not. The American brook trout has also been exported; in return, the German pisciculturists have sent to the United States the spawn of their carp, which is now being bred in its new habitat and largely distributed, promising to become a valuable addition to the supply of fish-food. It is stated to be particularly adapted to waters which have been barren by reason of their warmth and lack of circulation, as it flourishes in Germany in such waters. The United States have also received the golden Ide, an ornamental and food-fish, as bright in colour as the gold fish and growing to several pounds in weight. The eggs of this fish were sent to Maryland and the fish are being bred in the ponds of the Maryland Fish Commissioners in Druid Hill Park.

AMATEUR SEA-FISHING.

WE have cautioned our readers against the sharp bite a crayfish can inflict with its nippers, the effect of which, although it may afford merriment to the lookers-on, is far from agreeable to the suffering party. We have always found them very restless and annoying companions in a boat, particularly if the craft is small; and if their claws are not at once pegged—now an illegal process—or tied we have felt disposed to prefer their room to their company and throw them overboard. Lobsters and the larger species of crabs, are also sometimes caught with lines. Long as we have fished, however, we never have caught any large crabs in this way, and only one lobster, which we did on a spiller, it being hooked in the tendonous part between the nippers. The singular part of the affair was that we caught it in the middle of a sandy bay, one of the last places where a lobster might reasonably be expected to be found. The smaller sorts of crabs are often caught with the hook and line, but rarely to the satisfaction of the fisherman. They are also very troublesome in clearing the baits from the hooks when fishing too close to the bottom.

The torsk differs from all the cod species in having only one fin on the back. The head is small, the upper jaw a little larger than the lower, and both are furnished with great numbers of small teeth; on the chin is a single beard, and from the head to the back fin is a single furrow; the back fin begins near the head and extends almost to the tail; the pectoral fins are small and rounded, the ventral small, thick, and fleshy; the belly is

prominent, the anal fin is long, and reaches almost to the tail, which is small and circular; the lateral line is so faintly marked as scarcely to be perceptible; the colour of the head is dusky, the back and sides yellow, the belly white, the edges of the dorsal and the caudal fins also are white; the other parts dusky, and the pectoral fins brown. The torsk, or rather, as it is called about the Shetlands, the tusk and bismak, is a northern fish which descends no lower than the Orkneys. The largest are found on the coast of Iceland, but they are met with in great numbers in the vicinity of the Shetland Islands, where they are considered a very superior fish. They are caught in the deep-sea fishing with the cod and ling, and form, when barrelled or dried, a considerable article of commerce.

There are three varieties of the hake: the common hake, the forked, and the little hake. The distinguishing features of this sub-genus are two dorsal fins and one anal fin. The common hake is generally from two to three feet in length, of a slender form with a broad flat head; the mouth is large, full of very large teeth, particularly those of the lower jaw; the first dorsal fin is small, the second reaches from the base of the former nearly to the end of the tail, which is almost even at the end. The colour of the back is a dingy ash colour, and the belly of a dirty white; the scales, like the rest of the cod family, are small. It differs also from the other species of hakes, in having no barbels.

The forked hake is from a foot to eighteen inches in length; the head and body are shaped like the common hake, but it has a small beard on the chins. The mouth is equally large in proportion to common hake, and besides the teeth in the jaws, it has a great number of small teeth on the roof of the mouth. The first dorsal fin is triangular, and the first ray, which is very slender, extends far beyond the rest; the second fin begins just behind the first, and reaches almost to the tail. The ventral fins consist of two rays joined at the bottom, and separated or bifurcated towards the end; the anal fin extends from thence just to the tail; the lateral line is incurvated, the tail rounded. The colour is a cinerous brown.

The little hake is a very small fish, seldom exceeding five inches in length. The first dorsal fin is shorter than that of the preceding; the second resembles that of the other kind; the ventral fins are separated. It has a small beard and a rounded tail. The colour of the fish is very dusky, and its appearance not very prepossessing; it is, however, very well tasted, but is too small to afford much diversion to the fisherman.

"The hake goes about in great bodies, and is eminently gregarious; he is a very greedy fish, and," says Badham, "as fond of pouching pilchards as the cod is of lining his inside with him; one *mer lucius* will get through a dozen of the clupians in a very short time; nor, like other fish with sharp teeth, is he scrupulous against whom he wets them; and we must report, to the discredit of the Neapolitan hakes, that of the quantities we used to inspect in the daily fish markets, by far the majority exhibited the tail or half the body of some young codling (generally a brother hake), projecting from the mouth, the head and shoulders of which they had already digested. The Mediterranean and the Atlantic Ocean abound in hake, but being a fish of prey, it is usually on the mackerel and herring. They are also found in vast shoals on the Nymph Bank on the coast of Waterford, and in the bay of Galway they are so abundant that in some ancient maps it is mentioned as the "Bay of Hakes." Since the naval engagement in 1759 they also habitually frequent the neighbourhood of Belle Isle, where, according to the observations of Quervoent, they were never seen before. Their presence is likewise remarkable on the shores of Devon and Cornwall, where they are considered as very destructive to the herrings by breaking the shoals, which appears to have given rise to the proverb, "Wha

we lose in the hake we gain in the herring." Hake are caught in the same manner and with the same baits as the cod, and when plentiful, as indeed they usually are in the herring season, they afford most excellent sport, as they are greedy feeders and bold biters, and struggle hard for their lives. They seldom, however, begin to feed until after sunset, and usually leave off before sunrise, so that the only time to expect sport is in the night.

The flesh of the hake, when fresh, is not much prized, but it has of late years come into more favour, as it is white and flaky. When prepared by powdering with a little salt and pepper, it makes an acceptable broil for breakfast, and it also makes a very good salt fish. "When salted and dried in this manner," writes a French author, "they are called stock-fish, which is a German phrase, literally meaning *stick*-fish, because they are 'extended on sticks for the purpose of drying.'" But why not 'stock-fish'? They are salted for winter stock like other fish thus prepared and so called. The liver was considered a great delicacy among the ancients, but the moderns seem to entertain a different opinion. But as no fish nor any earthly creature ever yet gave universal satisfaction, Turner has not scrupled to affirm that it is scarcely worth its sauce. The testimony of English authors against the wholesomeness of the haddock is not accredited, for idiosyncrasies in taste go for nothing with us, who can appeal so readily to our individual judgment. It has been truthfully observed that there are some persons of vitiated palates who bribe their tongue occasionally to disparage turtle, and to profess mutton preferable to venison. Here at least, if not elsewhere, public opinion may be safely taken in preference to private judgment.

CREEL.

THE LATE MR FRANK BUCKLAND.

THE following resolutions were unanimously adopted at the Meeting of the Committee of the Thames Angling Preservation Society, on Tuesday last:—

"The Committee of the Thames Angling Preservation Society at this, their first meeting after the lamented death of Mr. Frank Buckland, desire to record an expression of their deep and earnest regret at his untimely removal from amongst them. It is now nearly twenty years since he became connected with the Society, as one of a sub-committee of Pisciculture, and for the distinguished services he rendered in that department he was elected as one of the Vice-Presidents, in addition to the presentation of a diamond ring of the value of one hundred guineas at the annual dinner of the Society in 1873. Shortly after his introduction to the Society he was appointed as one of Her Majesty's Inspectors of Salmon Fisheries, for which office he was eminently fitted, and the duties of which he continued to discharge with no ordinary ability to the day of his decease.

"The Committee are also desirous of conveying to Mrs. Buckland their sincere sympathy in the heavy bereavement she has sustained."

THOMAS SPRECKLEY, Chairman.

W. H. BROUGHAM, Secretary.

20, Moorgate Street, E.C.; Jan: 4th, 1881:

EXPORT OF SILKWORMS' EGGS FROM JAPAN.

THE breeders of silkworms in Piedmont and Lombardy, will shortly have an opportunity of recruiting their native supply by a very large importation of eggs from Japan. The same despatch states that some Italian speculators have reached New York from Yokohama, Japan, with nearly 100,000,000 of silkworms' eggs which were despatched by the French steamer of the 22nd ult. It is said that handsome profits may be made in this way, but the risks are heavy, as the worms may be prematurely hatched. The eggs in question were purchased in "cards," each containing about

30,000 eggs. These "cards" were then packed in cases about two feet square and covered with matting, in the same way as tea-chests are treated. There were 300,000 of these cards, which in Yokohama cost three dollars each.

THE YARMOUTH HERRING VOYAGE.

THE Herring Voyage for 1880 has been nearly 14,000 lasts, each containing 13,200 fish in round numbers—or, has good-hearted Frank Buckland would have said, six meals for every man, woman and child in the United Kingdom.

A fine fleet of trawlers have just put out to sea—most of them came in for a holiday at Christmas.

There is but little rod fishing done near Yarmouth in the winter season. To-morrow I have to make a professional visit near a lovely pool, and (D.V.) shall try my luck and rest my cob for two or three hours. I have a pike, four feet long, which I caught in this water.

ESOX LUCIUS.

CORRESPONDENCE.

[We do not hold ourselves responsible for opinions expressed by our Correspondents.]

ANSWERS TO CORRESPONDENTS.

J. E. MARTIN, Liverpool.—Silkworm gut is manufactured in Spain, imported by Messrs. Little and Co., of Fetter Lane, London, who supply the same wholesale or retail.

DANGER TO EPPING FOREST.

SIR,—A principle of great public interest and importance is involved in a project which the Great Eastern Railway Co. are about to bring before Parliament, for the appropriation of 70 acres of Epping Forest; and against the carrying out of this project I beg you will allow me—as one of the little band of those who, during the past year, have assiduously laboured to preserve open space in and around the metropolis—to record an earnest and emphatic protest.

At the present moment free and convenient access to the magnificent recreation ground, which has been secured for the inhabitants of London at so great an expenditure of time, energy and money, is obtained by two branches of the Great Eastern Railway—the one running from London to Chingford along the north-western side of the Forest, with stations at Wood Street and Hale End; the other running along its southern side, from London to Ongar, with stations at Woodford, Buckhurst Hill, Loughton, Chigwell, Theydon Bois and Epping. It is now proposed by the Great Eastern Railway Company, on the transparent plea of "public necessity," to absorb 70 acres of the Forest for an extension of the Chingford line to High Beech in order to "open up" the most retired and beautiful part of this fine woodland, notwithstanding the fact that from Loughton on the southern side to High Beech, on the opposite side of the Forest, the distance is only two miles, and that the whole of this splendid recreation ground is in reality easily accessible to the pedestrian from the numerous railway stations which at present lie around it.

The Corporation of London, whom Parliament has made the custodians of Epping Forest for the metropolitan public, though not inclined to concede the entire demand made by the railway company, appear to favour the project to the extent of allowing the appropriation, for the projected line, of a considerable portion of forest land. I trust, however, that Parliament will resolutely refuse to permit the appropriation of a single acre of a woodland so precious to the population of London. It is not on aesthetic grounds alone that I urge my plea, although these are worthy of more consideration than they ordinarily secure in this too-practical age; but on the ground that the proposed railway would—besides irretrievably destroying and disfiguring some of the most beautiful portions of Epping Forest—destroy the greatest charm of its choicest recesses, their comparative seclusion and remoteness from the hideous accompaniments of a modern railway—a charm which it has been the greatest object of its oldest defenders to retain and perpetuate.—I am, &c.,

FRANCIS GEORGE HEATH.

Brunswick Lodge, South Hackney, January 1st, 1881.

YORKSHIRE RIVERS.

SIR,—I beg to inform W. F. J. that I am this week sending a little book on "Trout Fishing" to the press, which will exactly meet his requirements for the Wharfe. It contains, amongst other interesting matters, a list of 130 different flies, with way of manufacture and seasons for use. Having lived for upwards of twenty years in one of the best trout districts (nine of them in the Yorkshire Dales), I trust the work will find some favour amongst my brother anglers. It will be well printed on good toned paper and sold at the low price of 1s. I hope to have it ready by the opening of the fly-fishing season.—I am, &c.,

Caistor, Lincolnshire.

THOMAS FORD.

WILL PIKE FEED AT NIGHT?

SIR,—Can you inform me whether pike will feed at night time and what are the best baits to use?—I am, &c.,

AN INQUIRER.

[We have caught pike when it was almost too dark to see the float, but never fished for them much after dusk. Perhaps some of our readers have?—ED.]

BOY SWALLOWING A FISH HOOK.—A boy having swallowed a fish-hook, endeavoured to pull it with the line, but without effect, as it was fast. Surgeons could give him no assistance, until making a small hole in a leaden bullet, the line being put through it, he swallowed it which running down the line, by its weight loosened the hook from its hold, which was then drawn up with ease.—*Gent. Mag.*, 1738, p. 380.

CLUB REPORTS.

ANCHOR AND HOPE ANGLING SOCIETY.

On Wednesday, December 29th, the season and special prizes were distributed:—A. Shakel, gross weight and carp; W. Salmon, jack and perch; G. Taylor, bream; W. Simkins, roach and dace; and D. Leston, tench. A very enjoyable evening was spent. The following members promised to give prizes in the coming season:—A. Shakel, D. Leston, J. A. Ball, W. Hale, W. Simkins, A. Glass, B. C. Booth, A. West, and T. Hall.—A. SHAKEL, sec.

BATTERSEA PISCATORIAL SOCIETY.

Nothing of importance has transpired in this society to warrant sending a report the last fortnight, the members being of a considerate turn of mind by allowing the fish to have a rest while they, during the Christmas festivities have been feeding. We intend, however, (weather and water permitting) to bring our contest for four prizes that has been adjourned week after week in consequence of the floods to a conclusion on Sunday next. As we have a numerous assortment of prizes to be competed for (and as the fence season is close upon us) it is well that we should once more go in (as we shall have to do) a "buster."—MEMNEUS, hon. sec.

CITY OF LONDON ANGLING SOCIETY.

Only one member weighed in on the 2nd, Mr. Castell roach from the Roding, three fish 1 lb. 3 oz., the result of four hours' hard fishing; the river was over the bank, very thick, and a heavy stream.—CAS.

THE DALSTON ANGLING SOCIETY.

The shows of fish at this club have, latterly, been rather small. The members have been out, but only small takes have been the result of their endeavours, but on Dec. 27, Mr. Fortescue had a nice show of roach weighing 16 lb. 5 oz., and again on the 2nd inst. the same gentleman had a take of roach weighing 15 lb., the largest one scaling 1 lb. 6½ oz. On the same day Mr. Eagles had 5 lb. roach.—W. L.

EUSTONIAN ANGLING SOCIETY.

TO ANGLING SOCIETIES.—Please take notice. The next Eastern district visit will be paid to the above on Monday, Jan. 10.—W. COSTER, Jan. 6.

HAMMERSMITH UNITED.

On the 2nd only one of our members had the courage to go out, viz., Mr. Lewis, who was rewarded with a show of dace from Richmond. I hear that Messrs. Green and Hoole intend going out this week so I hope to have a flourishing report next time. A member has offered a prize for the heaviest gross weight of fish taken from private waters from Dec. 25, 1880 till the end of the season. Thursdays only.—VORTEX.

LITTLE INDEPENDENT ANGLING SOCIETY.

On December 28th, 1880, two of our members went out and had a nice take between them; Mr. Scott, 10½ lb. of roach; and Mr. Humphreys, 5½ lb. of roach, and one dace scaling 7 oz. On Sunday several of our members tried their luck, but only two weighed-in. Mr. Petrie had a nice show of dace, 2 lb. 10 oz.; Mr. Wightman, 1 lb. 8 oz. of roach, dace and perch. After business, on Wednesday evening last, we had a rare finish up of enjoyment till closing-time. Our landlord, on the occasion of Christmas-time, came out grand; and the harmony which followed was excellently accompanied on the banjo by our old and well-known friend, Mr. E. Barr. Several members of angling clubs were present, and the evening closed with entire satisfaction to all.—W. BROWN, hon. sec.

ST. JOHN'S.

NOTICE OF REMOVAL.—The St. John's Angling Club is now held at the Three Compasses, Cow Cross Street, thirty yards from Farringdon Street Station, where we shall be glad to see any of our old friends any Friday or Sunday. The following members have had fish during the week:—On 20th ult. Mr. Goudge, roach, Mr. Hunt, roach and perch, on ult. 22nd, Mr. Thorling five nice jack, 17 lb., from the Colne, Mr. Clark, roach from the Lea, Mr. Giddings, roach from the Lea, on Sunday Mr. Storen some nice roach from Boxmoor.—F. L. T.

SONS OF THE THAMES.

The members of the above society are requested to attend at the Society's Meeting House, on Tuesday next, 11th inst., for the purpose of discussing important business.—PIXIE.
Jan. 5.

TRAFALGAR ANGLING SOCIETY.

Members of the above society are requested to attend on Monday night next, 10th inst., being quarterly night. Chair taken at Nine p.m. sharp.—R. GAZE, sec.
Jan. 6.

WALTONIANS.

One of our members, Mr. Hemmings, has been fortunate enough to obtain a magnificent show of roach from Pangbourne, weighing close on 17 lb.; our worthy secretary, Mr. Packman, showed a fine-conditioned jack of 7 lb. and another of 4 lb. from the Harp; the other takes were small, and according to present reports from the rivers they will no doubt be beautifully less.—WAT. B. WEBSTER.

WALWORTH WALTONIANS.

The result of the competition which took place on the 27th December is as follows:—Mr. C. Beale, 1st; Mr. Boalch, 2nd; and Mr. Peolaie, 3rd. Messrs. Bayley and Fox contested, but failed to score a scale. Another contest will take place on 7th, for three prizes, as follows:—Mr. Pearson, £1 1s.; Mr. Beale, £1 1s.; and Mr. Weatherhead, 10s. 6d. Three prizes will be competed for on the 9th inst.—PIXIE.
Jan. 5.

THE EEL AS A FOOD FISH.

BY GREVILLE FENNELL.

THE celebrity of the eel is wide. It is true that with Scotchmen, Jews, Egyptians, Mussulmans, and Greenlanders, they are in more or less disfavor. The Jews reject them, as they conscientiously consider the Levitical law classes the eel as among the unclean fishes, in having no scales. If this is the only reason for the Israelites proscribing eels from their *cuisine*, it is an untenable one; eels possess scales, which in number, from their minuteness, may be not detectable to the naked eye, but are distinctly revealed by the microscope; in the absence of which mechanical detective, they may be felt by passing the thumb nail from the tail towards the head of an eel-skin, and in this way, if dry, made to fly off in a cloud, like the miniature dust in a sunbeam.

Why Scotchmen should treat the eel with aversion almost amounting to the detestation allotted to the adder, is a problem difficult of solution, as existing in a nation where economic principles are proverbial, and eels abound. Avoided as loathsome in Scotland, they were worshipped in Egypt, and as we are told, made the belly-god of Grecian and Roman voluptuaries; while at the present day eels are highly prized and priced by Egyptian epicures. "Your idol is my idol, too," said Aristophanes, a Greek gourmet, "but in a different way; you Egyptians worship the eel as a deity, I adore him in a dish."

We would first clean our eel of the slime and slander which would bury it in mud and force it to refect only upon unclean things. This charge of reposing in a bed of filth and feeding upon garbage, brought against the eel, betrays as much ignorance of its natural history as has been shown in its supposed scaleless character. Be it known therefore, ye semi-incredulous or wholly sceptical listeners to these apocryphal domestic habits of the eel, that it does not live in mud properly so speaking, nor does it feed on any food in any slightest degree tainted—no bait, it is well known to the angler, otherwise than fresh, will tempt it—and that it is always at its best when bred and brought up in those rivers in which mud is absent, the waters are purest, and the detritus of the stream is of gravel or sand. No, ye extollers of roast duck, the internal, gastronomic chemistry of which has converted the exuviae of the horse-pond and the stale refuse of the shambles into sapid meat; or the lover of pork, the unctuous fat of which derives its exquisite *gout* from an omnivorous indulgence of eebiles, from cinders to offal, no longer turn up your noses over the *pesci nobili* of Italy, and the *adel*, that is the noble, *subaudi* fish corrupted first into aal, and then eel, of our Saxon ancestors.

But having done our best to place the scaly armour upon the eel, which is wisely given to most to fish to guard them from the dangers they have to encounter, we will venture to sustain our reasons why eels, as so generally averred, do not live in mud; it is simply that if the mud were more than a certain depth above them, the eel which, like any other animal, requires a due amount of atmospheric air to sustain existence, would, if it could not keep open the "blow-hole," or aperture to its retreat, most surely be suffocated. But it does not follow that therefore they prefer mud; indeed, it is certain that more eels are found beneath large boulders and in beds of clean silver sand and marl, fuller's earth and soapy ooze, than in mud as understood. When the winter approaches, and the weather, to which eels are very susceptible, gets to cold to bear, they seek some shoal of mud or ooze, but not above an inch or two deep, below which they penetrate, the upper surface acting as a blanket, and in which, through the apertures visible to the initiated eye of the fisherman, they respire in safety, unless the cruel spear drags them forth impaled, or the treacherous "sniggle" tempts them to their fate.

SATURDAY, JANUARY 15, 1881.

AMATEUR SEA-FISHING.

THE professional fishermen are still taking cod, ling, conger and ray with long lines, but very few hake have been brought ashore on our south-west coast. To those amateurs who can brave the weather, there exists almost as much chance of making a good bag as the more experienced. Indeed, we have heard old

salts say that the delicate hand of the amateur is more capable of telling a bite from those fish that would cunningly strip the hook of its bait, and escape with the prize, than the hard and horny fist of the veteran.

The common ling has a round body, covered with small scales, that adhere closely to it; the head is flat, and the eyes near the end of the end of the nose; the teeth are numerous, and it has a beard under the chin. The first dorsal fin is small, the second rises just behind it, and reaches very near to the tail; the pectoral fins are broad and round, the ventral fins small, and the anal fin reaches almost to the tail, which is rounded at the end. Ling vary very much in colour, the back and sides of some being olive, and of others ash-coloured or grey; the belly and ventral fins are white, the dorsal and anal edged with white, and the tail, near the end, is tipped with a transverse black bar, and tipped with white. The usual length of a ling is four or five feet, but they have been known to attain to seven feet or upwards. It is a most voracious fish. Wilcocks says of it: "He knew of one being taken by swallowing a fine red mullet and the portion of the trammel-net in which it had got entangled, as the net became hooked over the large teeth of the ling, which was consequently unable to free itself." They are sometimes caught on a whiting line, and, in common with cod, are often found in a puff-blown or distended state floating, either dead or dying. When in good season, the liver is large and white, and much oil may be melted out of it over a slow fire; when out of season, the liver is red, and affords little, if any, oil. This, indeed, is peculiar to the whole cod tribe, but in none so remarkable as the ling. Their spawning time is usually about the middle of June. The ling is fished for in the same manner as the cod, but it is not so general a fish on the greater part of our coast, and is taken in the same fishing-grounds in the North Sea, off the Irish coasts, &c. Numbers are also taken on the western coast of Cornwall, particularly about the Scilly Islands they are caught in tolerable abundance, and the latter place is famous for the production of ling of the best quality. The usual time for taking them is from November to the end of May. Like the cod, they are constant attendants upon the herring. The fish, when in full fettle, should carry its thickness well down to the tail. The ling is best fried, but we have tasted several toothsome dishes of which ling was the foundation. Great quantities of ling are salted for exportation, and, in our humble opinion, either salted or fresh, they are in no way inferior to the cod. When fresh and powdered, the head and shoulders are considered the best parts. Ling are usually cured without taking out the backbone. When cut or split for curing, if they do not measure 26 inches from the shoulder to the tail, they are not reckoned sizeable fish, and are called drizzles; these are in season all the summer.

The five-bearded ling grows to nearly as large a size as the common ling. The chief difference seems to consist in the form, which is thicker in proportion than the common ling; in colour, which in this fish is of a deep olive brown, with a whitish belly; in the dorsal fin, the first ray of which is very long; and in having four beards in the upper jaw. It is caught in the same manner as the common ling.

The three-bearded ling is much smaller than the two former, as it seldom exceeds 20 inches in length. The head is large and flat, the eyes near the end of the nose, the body long, slender and compressed sideways, particularly towards the tail. It has two beards at the end of the upper jaw, and one under the chin. It has a great number of small teeth, which are disposed in the jaws in the form of a broad plate of a triangular form. The first dorsal fin is peculiar, being lodged in a deep furrow just beyond the head; the second rises just behind it, and reaches very near to the tail; the pectoral fins are broad and round; the ventral fins

small; the second ray the longest; the anal fin reaches almost to the tail, which is rounded at the end; the colour of the body and head is of a reddish yellow, and marbled with a darker colour above the lateral line; the back fin and tail are darker; the vent fin, of a red cast, but all are spotted; the lateral line bends in the middle and then passes straight to the tail.

These fish are highly esteemed, but those we have partaken of we consider inferior to the common ling; they for the most part frequent rocky grounds, but we have caught them on spillers in sandy bays—they having the same baits as the rest of the cod species.

Couch, among many other highly interesting facts regarding the ling, tells us that the best season for its capture in the West of England, is in January and February; but according to Dr. Edmonson, in Zetland this fishery begins on the 20th May and ends on the 12th day of August. Mr. Brabazon says that in the North of Ireland it is in March, and that this fish spawns there towards the end of May. The ling is generally pronounced to be an eager feeder, and yet it displays some degree of choice in the selection of its food, amongst which a living prey is preferred, although it will eagerly swallow a piece of herring, pilchard or a slice of two or three kinds of cuttle. Pieces of conger are used in some places as bait; but while crabs and the lobster kind find no acceptance (for in a large number that were examined, none of these animals were found, although the stomachs of the cod caught in some ground contained them in plenty). Lacepede remarks that the ling shows a decided preference for the plaice; and, in confirmation of this, seven of the last-named species, which varied in length from six to ten inches, have been taken. Skulpins are sometimes found and even a rough hound (dog-fish) of considerable size.

Is there not here a suggestive hint to the amateur sea-fisher to try live-bait in pursuit of his quarry. Land-smelts, dabs, and other small fish, readily procurable, might be enlisted into the service; and the smaller contents of the trawl-net, now thrown overboard, might afford tempting morsels to those fish who prefer the live meal to the dead or mutilated kinds. We know of but one exception in which the selection of live bait for the better description of the denizens of the deep obtains, and that is in the employment of the tough and lively lampern, without a good supply of which the Dutch turbot and cod fishermen with their hand lines seldom think of going to sea, and if they do, it is with no great hope of a successful result. We all know instances of the marvellous power of pike to get rid of the gorge hook or flights lost in the attempt to secure them. But the ling appears to exceed even the pike in the contempt with which it treats the most indigestible substances. Couch says, that even severe injury to the stomach does not deprive the ling of its craving appetite is shown by the fact that when a large hook had gone down the gullet with its shank foremost, and thus had penetrated through the side of that organ, a turn of the hook had brought the point again through the bottom in the same manner, and again through the opposite side; by drawing the whole together, it left only a small cavity free, in which condition the line was bitten through, yet the fish escaped only to swallow another bait, with which it was caught.

CREELE.

THE CULTURE OF CARP AND CONSTRUCTION OF PONDS.

BY RUDLPH HESSEL.

PART III.—CONTINUED.

THE writer once had the following experience: During his absence a number of large carp were fed on coagulated blood which had begun to putrefy; the fish devoured it eagerly, got

sick, and most of them died in a few days from an inflammation of the intestines. Spoilt food should never be given to fish. If slaughter-house or kitchen refuse can be had, give these, chopped up small about the size of peas. Never give so much that remnants remain for any length of time in the water and begin to putrefy. Let no one be induced by the circumstance that the carps like to eat the dung of hogs, sheep and cows, to feed them on any putrefying matter. There are instances on record that thereby epidemics, particularly diseases of the scales, have originated.

The carp likes above everything else vegetable matter such as cabbage, lettuce, boiled potatoes, corn, turnips, pumpkins, melons, etc. The refuse of malt from breweries and distilleries is also very good food for carp; and wherever such refuse can be had, it should be given to the fish.

The small pisciculturist, having a pond of perhaps one to two acres near his house, will often be able to feed his fish on refuse, as he will always have it fresh from the kitchen and stable.

In conclusion, I earnestly recommend the culture of the carp to all pisciculturists. If the value of the carp for table use has once been recognised, it will become a highly esteemed fish, especially in the neighbourhood of large populous cities, and its culture will yield a larger and more certain profit than the expensive trout.

8.—EXTENT OF CARP-CULTURE IN EUROPE.

In Europe many thousand acres of artificial waters are to be found. In these enormous quantities of carp are bred. Some of these ponds, or rather lakes, have an extent of about 1000 to 2000 acres. They are provided with gigantic dams, many of them sixty feet high. By these the water is closed in, into broad valleys, containing no other fishes than carps from four to five pounds in weight. If we consider the size of these lake-like ponds, surrounded by enormous dams which are overgrown with oak trees 100 to 300 years old, series of three and more of these lakes being not uncommon, then we can form some idea as to the remunerativeness of these establishments, particularly in Bohemia.

The standard establishment with regard to the most extensive business transactions is found in Austria. The Prince of Schwarzenberg, of whom I have spoken previously, possesses more than 250 ponds of large size, the smallest having about ten acres, the largest 200 acres' water extent.

We find many villages where ponds of fifty to two hundred and more acres are maintained at the expense of the community.

9.—THE TABLE QUALITIES.

If the carp were a fish of inferior quality, like the buffalo-fish for instance, its sale would doubtless be limited to the sea-port towns of Northern Germany and the principal cities of Central Europe, as Vienna, Berlin, and Paris. In the latter city, in spite of an abundant supply of salt-water and different kinds of fresh-water fish, the carp is even preferred to these, and, with the exception of trout and salmon, it frequently commands a price three times as high as that of all the rest.

I maintain my assertion that the carp, whether it be scale, mirror, or leather carp, is one of the most excellent fresh-water fishes, and its introduction will be of great value in point of national economy, especially on account of the facility of its culture and the enormous extent to which this may be carried on.

The carp and its value as a fish of culture will before long be fully appreciated, so that we may be enabled favourably to compare the results of its culture in America, as also the extent attained to, with any other country, to our complete satisfaction.

10.—HABITS AND MODE OF REPRODUCTION OF THE CARP.

The carp is partial to stagnant waters, or such as have a not

too swift current, with a loamy, muddy bottom, and deep places covered with vegetation. It inhabits now most of the larger and smaller rivers of Europe, particularly the Elbe, Weser, Rhine, Danube, Po, Rhone, Garonne, Loire, then the Bavarian and Swiss lakes, the Lake of Constance, etc.; even salt water seems to agree with it very well. I have taken it in the Black Sea, where its weight often amounts to from fifteen to twenty pounds. It is also found in the Caspian Sea in great numbers, and is known there by the name of *Sussan*.

It is an advantage that the carp is able to live in water where other fishes could not possibly exist, for instance, in the pools of bog-meadows or sloughs. However, it is not by any means to be inferred from this that the best locality for carp-ponds of a superior kind could be in such situations. The presence of too much humic acid is unfavourable to the wellbeing of the carp, as we shall see presently in the chapter upon the establishing of fish-ponds.

The carp lives upon vegetable food as well as upon worms and

imported from Europe for the purpose of breeding in the winter of 1876-77. It is a most striking fact that the carp, though it does not take any food during this winter sleep in its natural retreat, does not diminish in weight, while in the so-called "winter chambers," it does so to a remarkable degree. These "winter chambers" are large tanks 1000 to 5000 square feet in size or less; they are sometimes walled in with masonry, sometimes they are constructed of wood.

Fishes intended for sale are kept in them for a few weeks or months during the winter.

The carp does not grow in the winter. Warmth alone seems to exercise a favourable influence upon it and to promote growth. It only grows in the months of May, June, July and August, and does not appear to continue doing so in September. The slight increase in weight which takes place during the latter month seems to grow out of an accumulation of fat which is being deposited around the entrails. In ponds which contain plenty of food and healthy water, in any ordinary year, the growth

larvæ of aquatic insects, which it turns up in the mud with the head; it is very easily satisfied, and will not refuse the offal of the kitchen, slaughter-houses and breweries, or even the excrement of cattle and pigs. I propose to enter further upon the subject of feeding it when I speak of its culture in ponds.

In the moderate zone, that is to say in Central Europe, the carp will, at the beginning of the cold season, seek deeper water to pass that period in a kind of sleep. This will sometimes occur as early as the beginning of November, if the winter should set in early; and it is to be remarked that they will retire at an earlier period in ponds than in rivers. They do so always in groups of from fifty to one hundred and more. They make a cavity in the muddy ground, called a "kettle;" in this they pass the time until spring, huddled together in concentric circles with their heads together, the posterior part of the body raised and held immovably scarcely lifting the gills for the process of breathing, and without taking a particle of food. They do not take any food from the beginning of October, and continue to abstain from it, in some countries until the end of March, and in colder districts even somewhat later. It will not answer, however, to depend on this habit when transporting them for propagation in the spring or winter time, more especially young carp one or two years old. The fish will arrive in a worn and hungry condition, and must be kept in a tank constructed on purpose for observation, where it has no chance to bury itself in the mud; here it will sometimes take a little food. At such times I generally make use of boiled barley, or rye flour converted into a kind of tough paste by the addition of hot water, and with this I mix a little loam and rye bread; but I continue the feeding only until I can judge from the looks of the fishes that they have recovered. This method I followed with the carp which I

and increase of weight in the year will be represented in figures as follows:—

	Per cent. of original weight.	Per cent. of growth.
May	10.15	13
June	33	31
July	36	34
August	20	18
September	6	4
Total	110	100

If the weather in the month of May be mild and warm from the beginning, a better growth may be expected, amounting, as in June, to about 30 per centum. This month (May) is decidedly of great importance for the growth of the fish during the current year, for, in proportion as the fish has grown in the short space of one month, it will take more food in the following ones as the increase of its growth and consequent wants will demand. Culturists, therefore, consider the month of May as being the most important of the whole period of the carp's growth. The above-given calculations, of course, are limited to ponds in which no artificial feeding is resorted to, but in which there is sufficient food by reason of the good quality of the water and soil which produces it.

(To be continued.)

GEORGE JAMES EATON, of Starkholmes Matlock-Bath, Derbyshire, respectfully invites Noblemen and Gentlemen to try his standard FLIES for the present season. No flies sent or made up but what he himself has proved sure killers. A trial is all that is required from gentlemen who can fish to prove whether they may be genuine or not. Patronised by some of the best fishermen of the day. All flies dressed on the best Kendal hooks. Prices: Point Flies, 2s. 6d. per Dozen; Dropper Flies, 2s. per Dozen. Orders punctually attended to.—[Advrt.]

EELS AND EEL CULTURE.

(ANGUILLA ACUTIROSTIS.)

(Continued from p. 17)

FISHING APPARATUS.

It will be seen from the above that this great body of water has a tremendous current. It is in the rapids and swift places that the weirs by which the eels are caught, are set. A weir, I may say to those who are unacquainted with its structure, is a large sieve, or an oblong box, about 12 by eight feet in size, open at the top, and one end, with a bottom of slats so arranged that the water may pass through. Fences, made eel-tight, that is, so constructed that water, but not eels, may pass through them, are run diagonally down, from opposite sides of the river. The weirs, sometimes two and again one, are placed in the intersections of the fences or leads. Eels are said to always run down stream, and when they arrive at a fence they take a lightning speed which throws them at the gates out into the weirs, where a man usually stands to capture them. The apparatus has been rendered in part useless during the past summer by an unprecedented season of low water. It will be remembered that a great drouth has prevailed in the East this year, which accounts for it. The State reservoirs were not sufficiently large to provide for such a season. Though quite low in 1873, it was lower on September 18 than it has been since 1849. Besides the drouth, other causes conspire to make low water. The Oswego River is lined with great manufacturing interests which require a large portion of the water to keep them running. The effect of these is more and more marked as one travels up the river. Low water has made eels scarce. No fisherman can count on more than from 200 to 400 dols. worth of the fish this season. In fact, careful estimates show a gradual falling off, both in the eel and water supply for several years past.

SEX IN EELS.

There is no longer any question as to the difference between sexes in eels. The males are usually small and poor. On account of this fact, few are taken by the fishermen. Being small they either escape through the weirs and fences, or are thrown out by the fishermen "to grow," as they say. One fisherman whom I asked if he ever seen a male eel, stated that he had examined the stomachs of a great many eels, but had never seen one. The reason why, is obvious. In the first place he always examined the largest female he could find, and in the next the organs of generation in the male are microscopic forms, hardly visible to the unaccustomed eye. There were three eels at the Exposition just closed in this city, all of which, I believe, were males.

SPAWNING GROUNDS.

Mr. Sawyer, in the *New York Times'* article alluded to, shows conclusively that *all* eels do not go to sea to breed. I am convinced first, that eels do not breed in the ocean; second, that some breed well inland. I base my first opinion on well authenticated evidence that large eels are seldom found in the ocean, and that eels prefer and do breed in the deep mud at the mouths of rivers, at the heads of high tide. Further on the ocean breeding of eels I have nothing to offer. As to their breeding inland I have satisfactory (to me) proof. First, on the evidence of Mr. Sawyer, who claims to have found them breeding in a pond near Saw-mill Rift, Delaware, his home.

I am convinced that eels breed in Oneida Lake, for these reasons: The fishermen alluded to in this paper generally state that eels breed there; it is a great resort for the fish, and they are seen here in vast numbers during low water. In August the fishermen say the eels are "on the grass," to use their own expression. Few eels are ever caught in this month, the best

fishing being from May into July and from September through October. By "on the grass" the fishermen mean that in July they find them often in balls like snakes, into which a spear is thrown, and many secured at once. They are found at this time among what is known as eel grass. Here they congregate and become pregnant. The eel grass grows in the soft mud with other weeds. The fishermen described to me a "jelly-like substance," as they say, in chunks the size of two fists, which they find here occasionally in the early winter, which, from their description, is probably eel spawn.

Mr. Fuller described to me his experience with some of this spawn. He reserved a space on the edge of the river near his fishery at Fulton. He watched the growth of the minute fishes in embryo. One morning he visited his miniature pen to discover that the young fry had escaped. True to their instinct, the young eels had crawled out of their pen on their first exit from their confinement as embryos. It is a well-established fact that young eels are adept in scaling almost any dam. Mr. Wesley, of Evanston, an old English fisherman, related to me several days since how forty years ago he used to watch young eels in springtime climb the rocks damming a small stream in the mother country. Their breeding habits were familiar to him as far back as 1830. His statements are entirely confirmatory to the fact of their spawning in part in tide waters.

But reverting again to the inland eels, it will require nothing less than a marked female, let loose in Oneida lake and caught in the act or spawning in the tide waters of the St. Lawrence River, to convince me that these eels travel 800 or 1000 miles to breed.

As to young eels the fishermen have never seen them running up stream in the river in question, nor in the river at all. Every fisherman with whom I conversed claims that the eel breeds in Oneida lake. To cap the summit of my beliefs I will say that as soon as I began to arrange my material for this paper I examined all my scientific data gathered through years, I might say since I was fifteen years of age, and found that in the spring of 1874, a friend and myself observed little eels, scarcely two and one-half inches in length, among the eel grass of mill-pond on Little Salmon river, at Mexico, Oswego County, New York.

The following characteristic letter received a few days since tends to confirm the above:

Henmanville, N. Y. (Horseshoe Dam), Oct. 32, 1880.

Mr. H. Ballou, Evanston, Ill.

Dear Sir,—I received your letter in regard to catching eels, with pleasure. I have taken these fish here for forty-one years. My father commenced fishing after the war of 1842, and continued until he was sixty-five years old. In 1864 I made 1400 dols., and this year will not receive more than 300 dols. The greatest catch I ever made in one night was 1400 pounds. I have five weirs. The Leather Stocking Club of sportsmen made such disturbance that I did not accomplish much during the fore part of the season. I know that eels breed in Oneida Lake. They hang on the eel grass there three or four days in the month of August. That is the time they become pregnant, for I never saw any preliminary signs of breeding at other times. I keep one man in my employ. I sent eels as far East as Albany last year, and have sent to your city (Chicago) and Philadelphia this summer.

Yours truly,

LEWIS MONTAGUE.

SCARCITY AND PLENTY.

I have already stated that for several years past eels have grown less and less in numbers, and that it was in part due to the drouth and absorption of water by the mills. Let me elaborate. The average flow of the Oswego River is 600,000 cubic feet per minute. The water is a foot lower this season than low water mark, reducing this flow from the average to not more than 400,000 cubic feet per minute.

This drouth has, no doubt, destroyed many eels because, as I

shall show hereafter, they can live on water alone for a long time, and it is necessary to have a good and fresh supply to insure their keeping. Another note is this : eels are taken most plentifully in heavy rainstorms. They spend much time in the mud. Consequently when it rains the water is rolled, and true to their instinct, they are not disposed to distinguish the difference between it and the soft mud. Since it has not rained during the last summer they have retired deeper and deeper into the mud to exist, and have not run in any numbers. The extent of this mud in these inland lakes is this : I have seen the top end of a fifteen foot pole disappear from sight in it, without much effort on the part of the experimenter. I consequently think that the eels are not disappearing from the river, but are simply awaiting heavy rains to appear again in vast numbers. I should not be surprised if any excessive breeding during the past summer had been prevented by the drouth.

(To be continued.)

MERCILESS FISHING.

ANYTHING approaching reckless or wilful destruction, or overgreediness in results, is to my notion decidedly objectionable. I have frequently expressed an opinion against prizes for gross weights of fish, because it encourages merciless slaughter. As, for instance, a club offers a prize for the greatest weight of barbel taken in one day—a number of members give in their names as competitors—certain swims for a day or two previous are well baited—the limit of size, about 12 inches from the eye to the end of the tail, represents only a small fish—the day arrives and the barbel are probably on the feed—care is taken that every fish of the limit and upwards are placed in the well—at the end of the day the fish are all taken up to the clubroom and the large table is filled with an enormous show of barbel—the sight is regarded as a splendid one and it is put down as a magnificent show—the health of the successful competitors is drunk and in turn the various competitors relate how their fish were caught and some incidents connected therewith—on the next date of publication the angling newspapers place on record the grand doings of the piscators and the event goes forth to the fishing world of the enormous capture of fish. This is one side of the question, but it is not altogether the merciful side. What really becomes of the fish after their exhibition in the clubroom? Very few people, except amongst the poorer classes, would accept of a barbel as an article of food—they are not nice to eat—I have tried them once but I never intend to try them again. It must necessarily be taken for granted that the great portion of barbel after being exhibited are not accepted by the members. And this is not all : the Thames becomes stripped of its barbel by these gross-weight competitions and the anglers for the time being become perfect vultures. I can hardly think with sound common reason any angler would coolly and deliberately ransack the river to gratify his own sportsmanlike desires—on the contrary, he must feel that to take advantage of the barbel when they are well on the feed it is akin to dishonesty to retain every fish he has taken and walk away with a sackfull of fish which very few for eating purposes would accept. I regard the value of barbel more for the purposes of sport—they give plenty of that to the anglers. If a good fish is hooked he is safe to run up the stream and struggle hard for his liberty. I remember once fishing for barbel with a friend of mine, and having hooked a big fish, the fisherman called out, lustily “Mind, he’ll be round the pole.” The reply was instantly given, in scarcely such well-chosen language, “Confound the pole—remove it.” The fisherman accomplished it just in time—the fish played vigorously up the stream, but my friend was a good old angler and he succeeded in safely getting possession. I am convinced that when these gross-weight competitions are discontinued and the

system substituted of giving prizes for specimens, it will be a great check to the merciless slaughter which now prevails. It will be far more interesting to an angler when he has had a good day’s barbel fishing in some favourite swim to return the greater portion of his fish ; and I would venture to suggest that whatever fish he returns he should mark such in some way that he would be able to recognise them again with the probability of once more putting his steel into them ; and giving them their liberty once more, he may possibly renew their acquaintance on another occasion. There is something to talk about in this, but there is certainly not in the other. I have heard one man boast of his enormous takes of barbel, and I have listened to another who generally puts back his fish or the greater portion of them, marked as I have suggested, and catching them again. Which, I ask, is the most to admire? Those who take the merciful side of the question will unhesitatingly accept the views of the latter. But this merciless practice of fishing is not confined to barbel competitions, it is unfortunately inherent to some of the jack anglers, and the practice too often extends to private waters. In the latter case it is unjust to the proprietors besides being a decided breach of privilege. Angling in private waters should be practised for the enjoyment of it and not pursued for merciless destruction. It should not be made a matter of business but apart from what has been termed “the beggarly elements of trade,” to practise it as a healthful and enjoyable recreation. Here is a beautiful park with its antiquated mansion and ancestral trees shut in from the bustle of life—a very picture of romance and pictorial excellence. The thoughtful piscator exclaims, as he enters, “If I do not catch a fish I shall enjoy the beauty of the park,” and this is just the feeling all should possess—a love for the works of nature, united with the interests of piscatorial pursuits, will then guide each when they have received the privileged permission to fish. The Thames has resources for increasing the stock of fish which many private waters do not possess, and jack-fishing in a public river may be practised more indiscriminately and with less objection as regards numbers. Jack are more valued as an article of food than barbel, and are therefore more acceptable as gifts. In private waters where there is an enormous quantity of jack, an occasional thinning would be, and undoubtedly is, beneficial, but where those fish do not abound to any great extent, “giving it a good doing” is scarcely justifiable, and there is no real credit in the doing of it. It is remarkable at a time when jack are madly on the feed how easily they can be caught, and I have an instance of this kind when in a pond not well stocked with fish every jack was taken out of it by one angler in a very short time. In the present day, when the pursuit of angling is so largely on the increase, there should be some regard to moderation in the retention of fish, and this principle should guide anglers more where their fishing has been one of privilege. I have known instances where an abuse of this kind has shut up the privilege altogether, and I would not blame any proprietor for doing it, except that it shuts out those who are content to pay proper respect to the permission. It rests more with the angling clubs in London to put down the merciless destruction of fish than any private individual ; and other associations that have been established to regulate the fishing societies, in union with them, have a certain amount of responsibility clinging to them. Whilst encouraging all fair and honest angling they should discourage the system of prizes for gross weights which is attended with such appalling results, and as a fair substitution make the competitions for the best number of good fish. There is more honour and glory in getting a prize for four good fish than for an enormous quantity of simply what are termed sizeable fish, which if left in the river would increase in size and give better and truer sport to the anglers afterwards.

RIVER REPORTS

MID-THAMES.

Nothing has been doing worthy of record on Mid-Thames during the past week. The river, however, is now in fine trim, and jack, roach and chub are only waiting to be asked to accept to be hooked. I hope to report some grand catches for next week's issue.—MARLOW BUZZ.

Thames (Goring).

Water in good order for jack and perch. No snow in the water yet. I think there is more snow to come. On Wednesday, out with Mr. C., of 48, Warrington Crescent, Maida Vale—four jack; three jack, going 16 lb.; one jack, 2 lb.; and lost, three jack.—J. RUSH.

Thames (Richmond).

The river is in splendid order for fishing now and sport looks well till a thaw sets in to colour the water. Again there was a heavy fall of snow here on Wednesday morning, but it will not make any difference to the river till it thaws. There has been a lot of anglers down since my last report with very fair success. C. Brown, out two days, 16 lb. of roach and dace; H. Wheeler, two days, 8 dozen of dace; E. Brown, one day, 6 lb. of roach and bream; Job Brain, three days, 27 lb. of bream and dace; J. Bushnell, three days, 25½ lb. of bream and roach.—J. BUSHNELL, fisherman.

Thames (Twickenham).

The river here is now in good condition, but, the weather being so intensely cold, we have had but a very few customers. The ground is entirely covered with snow nearly 3 inches deep, and it is freezing hard; and, when the weather breaks up, and the snow finds its way into the river, we may expect another blank day or two. The only takes worth mentioning were Mr. Beard and friend on last Sunday, who took 110 splendid dace, all sizeable fish, from ten o'clock until dusk. Mr. Beard is one of our all-the-year-round anglers, and he deserves all he gets.—ALFRED PERRIN.

P.S.—Mr. Andy Anderson, of the celebrated Eel Pie Island Hotel, and a few friends, taking advantage of the fresh breeze, had a sharp run up the river in his well-known yacht (the Red Cross Knight). All went well until returning from Teddington, when through some misunderstanding by the man in charge of the canvas, while making a tack, they came into collision with the overhanging boughs of the trees of a well-known lawn of a gentleman's residence on the banks of the river. In a few minutes the Red Cross Knight felt herself a little mixed, and in another moment the whole of the rigging was swept away. I am pleased to say there was no injury done to any of the occupants of the yacht, excepting a little damping, but had the lady on the lawn had her wishes carried out, they would have all been very wet, to say the least of it. After a little manoeuvring the gallant Knight was got off and token to her safe mooring a little the worse for the combat.—A. PERRIN.

Devon (Ilfracombe).

The north and north-east winds that have prevailed of late, and which make the coast of Devon a lee shore, have almost put a stop to our sea-fishing here, being situated as we are on the northernmost promontory of the Bristol Channel, we get the full force of the wind and sea. During these winds, when there is a moderate tide some boats put to sea or drop anchor just outside the pier for an hour or two, and get good catches of cod, conger, ling, skate, &c. Bottom fishing with hand lines. All hands are anxiously waiting for the S.W. wind, when both hand lines and spillers will be in full work.—HENRY COMER.

Exe and Canal (Exeter).

I think, after my day's ramble through the marshes, and by the look of the weather, we are now going to have it smart. We met several gentlemen with skates, but, although we were surrounded with ice there was none fit for that purpose. We were out shooting, and a jolly time we had—sport, plenty, but small fry, indeed—but when one has such friends as Mr. Charles Blake, of the Royal Museum Hotel, Exeter, and others of a similar genial humour, not forgetting Mr. Duffell, of the Bridge Inn, Topsham—who is all life for an old one—we could not be off enjoying ourselves. Not a rod was seen the whole way or day; in fact, last week was very tame. A few pike and roach were brought in. Salmon are on their road back, owing, no doubt, to the mildness of the weather. This time last year we were frozen up completely, thus making the fish much later in coming back. Several dead fish have been marked much lacerated, owing, no doubt, to the lumpy waters and mill wheels, also gratings, and not so much from pollution this time, although I have something to say upon that point in my next. I have had a roach sent me to-day without any caudal appendage at all—quite a stump at the wrist—apparently, or I should imagine so, born thus. It was so beautifully grown over, the scales overlapping precisely in the same way as if you were to loosely clasp your hands together by the fingers. We have an enormous quantity of roach deformed in the Exe, for which I cannot account, but will solve the problem yet—that is, if perseverance will do it.—FRANK GOSDEN.

Fareham (Hants).

An old dog otter, weighing 23½ lb., was trapped in the back-water near Fontley Iron Mills on Friday last by a keeper of H. P. Delmes, Esq., of Cams Hall. This is the third otter that has been trapped in the Titchfield Fishing Club Waters this winter.—J. T.

Lea (Cook's Ferry).

The waters down here are in good order, and a fair number of anglers have been down. The take has been very small. Mr. Harper, of Mansfield Street, Kingsland, had a fine jack weighing 6 lb. and one 2 lb., both in good condition. We had some fine roach taken from the old river. We expect several members of the London clubs down this week on account of the favourable state of the water.—S. SEWELL.

P.S.—This fall of snow may spoil the water if it melts.

Trent (Alrewas).

Nothing has been doing in our locality the last few weeks, consequently I have little to write about that would interest your readers. The present week is again another blank, for although the water is in first-class order for both pike and chub the weather has been so severe that no one has cared to venture out. At the time of writing (Thursday) the frost has no appearance of going. All the pools and backwaters are frozen over, and the country in the Trent Valley presents a very wintry appearance.—JAMES GREGORY.

Trent (Newark).

The sharp frosts of this week have caused the river to run down low and clear, so that anglers who do not mind the inclemency of the weather may enjoy a little pike and chub fishing (if they can get at the latter). But at the time of writing skating seems to have more votaries than fishing; for the backwaters are locked in an icy embrace, and skaters are disporting themselves on the frozen surface, so I am afraid pike-fishers will have rather a difficult job to find a suitable spot; but those anglers who care nothing for the keenness of the atmosphere may find the chub inclined to take a nice bit of pith if they will only operate on suitable spots. I am afraid I cannot recommend any other sort of angling if the present frost continues; last night we had a fall of snow, but if it stays on the land, and does not melt and get into the river it will not interfere with chub-fishing this next day or two. I have not seen many anglers out this week, but those who have been have been fairly successful among the chub. One of our locals went down the Devon, or rather up, and brought away a very nice sample of chub, whilst a pair of anglers who visited the Witham got a very good lot; bait, pith.—THE TRENT OTTER.

Trent (Nottingham).

Although the water and weather on Monday was plenty good enough for pike and chub fishing at this season of the year, the anglers, however, did not seem to get on very well; though a few fish of both sorts were taken, and the best basket I saw came from the neighbourhood of Ratcliff, consisting of six chub, which were caught by scratching; and the five pike the same angler had, had been persuaded to take live bait. The latter weighed a little over 12 lb., while the chub averaged 2 lb. each—a very fair basket altogether. The rosters who went up the river brought down only a few of either sort mentioned, none of which were of any size. On Tuesday a remarkable change took place, which many of the anglers thought would cause most of the fish to go dead off the feed, and perhaps it will be remembered that on that day the weather was very dry and frosty; and it was the general opinion among these anglers who are in the habit of fishing during the winter months, that it would be next to a waste of time to attempt to capture any of the finny tribe with rod and line. These, however, were greatly surprised, on the return at night of one of our noted fishermen when he produced several roach over 1 lb. each, and some good chub, the largest of the latter weighing 4 lb. But what surprised the anglers most was when they were told that all the fish had been caught with worms; to which one of our anglers said, "We do not understand this—to catch chub with worms in frosty weather, and water clear, with the thermometer standing all day below freezing-point." This, I must admit, was a bit of a puzzle to me; but now I believe it to be perfectly true, and that such a thing might happen for once I do not wish to dispute; but in all my experience I should never think of recommending worms for chub under the circumstances named above. Weather at the time of writing is very unfavourable for angling, there being several inches of snow on the ground, but the water is still clear and low.—W. BAILEY.

Wye and Derwent (Derbyshire).

Both the above rivers are in first-class condition for fly fishing, but, owing to the snow coming, and the severity of the weather, very few anglers have cared to turn out for the last couple of days. Both on Monday and Tuesday there were a good many anglers out on both rivers, both fly, bottom, and pike fishing. The best take was made on Monday on the Derwent, with the artificial fly; three brace of good-sized grayling were killed with the furnace and dyed hackle flies; the fish rising the best from one to three. Very few natural flies have been out on either river this year up to the present time. There has been some good-sized dace and roach killed on the Derwent with the cockspur worms, the fish running from 6 ounces to 3 quarters of a pound each. Weather still very cold, and a slight sprinkling of snow on the ground. Angling prospects not very encouraging while this very severe weather continues.—GEORGE JAMES EATON, Starkholmes, Matlock Bath.

The Yore (Yorkshire).

There has been a decided change for the better in angling prospects this week, and a few nice dishes of grayling have been caught with the little red worm for bait, but it has only been keen sportsmen that have braved the cold, which has been intense; in fact, one correspondent writes me that he had to free his line from ice several times during Monday, on which day he basketed 3½ brace of very nice fish. To-night (Wednesday) the thermometer indicates 3 deg. of frost below freezing point, and whilst I am writing snow is falling very fast.—FRANCIS M. WALBEAN.

PIKEING IN PRIVATE WATERS.

WE accidentally omitted to mention that this interesting article was by one of the members of the Richmond Piscatorial Society, and was read before the Society at one of its meetings.

TO ANGLERS.—W. J. Cummins, Fishing Tackle Maker, Bishop Auckland, is now prepared to forward to anglers his Illustrated Catalogue, which is not only a Trade List but is interspersed with practical hints, useful directions, and valuable information gathered by the river-side from twenty years' experience. The stock consists of his unrivalled Salmon, Trout, Grayling, and Pike Rods, Lines, Reels, Baskets, Artificial Baits, Fly-books, Landing Nets, Gaffs, and last, but not least, his celebrated Trout Flies, which for killing powers stand unequalled. Every article kept in stock is of the very best description.—[ADVT.]

THE USURPATIONS BY "RIPARIANS" ON THE UPPER THAMES.

A MEETING of the Thames Conservancy was held on Monday at the offices, Trinity Square, Tower Hill, and as one of the purposes of the meeting was to receive a deputation from the Thames Rights Defence Association, there was a very full attendance. Most of the City Members, including Sir Charles Reed, M.P., Mr. Alderman Finnnis, Mr. F. Bennoch were present (but excluding the Lord Mayor); and the deputation were doubtlessly flattered by seeing that their action had brought to this early meeting those "Riparians" who have been prominent in attempting to wrest to their own private use the public waters of the Thames.

Admiral Sir F. Nicholson presided.

Mr. Francis Francis, in introducing the deputation (which included Mr. Ledger, Mr. Lehman, Mr. J. W. M. Francis, Mr. John While, Mr. Clench, &c.) remarked that the Association represented by the deputation had been formed in consequence of the action taken by some of the landowners in the valley of the Upper Thames in laying claim, in some instances to the waters of the River Thames, and in other instances annoying the anglers who, without trespassing upon land, merely exercised their right of angling in the open waters of the Thames. Mr. Francis Francis pointed out that in the cases referred to certain persons had only of late years made these claims to be the private owners of parts of the Thames—for the claims were never made in bygone times, when the produce of the river fisheries was of great value as food—and if the landowners had any right to the produce of the river it might be considered as very certain that they would not have been behindhand in laying claim to their property, and exercising whatever rights they possessed for their direct profit or benefit. There was evidence that, where such rights existed (and too much existed under charter), they were exercised; but in all the rest of the river the fisheries were open and public. The Conservancy was appointed by the authority of Parliament to "conserve" the public rights; and that the Conservancy was not appointed merely for the purposes of navigation—for the superintending of barges going up and down the river—but were also in charge, for the public and the open fisheries, was to be seen from the bye-laws which the Conservancy was empowered to make, in regard to the size of fish, the fence months, the mesh of the net to be used, and the power to appoint bailiffs. These were all public duties, and it was as much the duty of the Conservancy to maintain the fisheries, and to protect the anglers in the exercise of their rights, as it was their duty to protect the navigation. The duties were concurrent, and yet the anglers were annoyed by persons who lived on the banks of the Thames, some throwing stones and bottles in the water, and sending dogs in, and others claiming, —without a show of title—to be possessors of the fishing rights.

Sir F. Nicholson remarked here that the deputation would remember that prior to 1866 the Conservancy ended at Staines; the Conservancy up to then had nothing to do with what went on above Staines, and he believed that there were no claims to private fisheries below Staines.

Mr. Francis Francis, continuing, said that the action of the Conservancy was not confined to below Staines now, and thought there were no claims to private fisheries in the "City waters"; now, there had been, as groundless as those now made in the upper waters. Then, too, the Conservancy had acted as if the fisheries were public, for in appointing men and bailiffs over the fisheries the Conservators had acted as they would not have done—and he said this with emphasis—if the fisheries had been private property. (Hear, hear.) The Conservancy stood in this anomalous position—there had been appointed, under the authority of the Conservancy, bailiffs to protect the fisheries, which

private owners claimed as their own. Now, it could not be held that Parliament would pass an Act to appoint a Conservancy to protect the private property of individuals, by the appointment of bailiffs out of the public funds; nor would it seek to increase the produce of the river merely for private owners; and even on this aspect of the case—just the broad features—it was apparent that it was the duty of the Conservancy to preserve the fisheries and protect the public, who exercised the right to angle in the river where it was open. The deputation came to offer their aid, politically and otherwise, to exercise their rights over the river for public purposes, and the Association for the Thames' Rights Defence would give every support to the Conservancy to become fully representative, and have "conservancy" of the public rights on the Thames. There were powers, the deputation held, which should be obtained over the tow-paths; for landowners who were paid rent for the tow-paths held themselves at liberty to exclude the public from the use of these thoroughfares by the river, and had actually done so.

Sir F. Nicholson pointed out that, under the 67th clause of the Act of 1866, all private rights were reserved.

Mr. F. Francis said he knew this; but the Act did not create any rights, or give any private rights over the river, which had no existence before.

Sir F. Nicholson remarked that the deputation's questions raised many points of law which had never been settled as to the public rights on a navigable river. There have been cases, however, on the question.

Mr. Francis said he should like to know of any decisions.

Sir F. Nicholson replied by referring to the case of "Murphy v. Ryan."

Mr. Francis rejoined that this case, which he knew very well, was not in point.

Mr. Ledger was then asked to speak, but was too unwell.

Mr. White said he wished to call the attention of the Conservators to an aspect of this case which had not been touched upon. The deputation represented the public opinion of 4,000,000 of people—for all London was watching with the keenest interest, the stand being made by the Thames Rights' Defence Association for the preservation of common rights on the Thames—and, indeed, the public of London were not disposed to let these common rights go "by the board." Moreover, there were 150 angling clubs in London; these, though having large numbers of members representing but a tithe of the persons interested directly in angling on the Thames. These and the others who sought recreation on the Thames, had been greatly shocked by the manner in which the public rights had been usurped in the Thames by land-owners, and he must bring to their notice that those persons who had done these things were acting in a manner highly dangerous to that respect for property which it was highly necessary should be cultivated at this period. The "many-headed" would not be likely to respect property, when they found "property" over the common rights of the people was obtained simply by taking—and it was deeply to be regretted that members of the Conservancy had used their position as Conservators—as members of this Board, to whom the protection of the Thames was entrusted—to make claims of private ownership in the waters. This, at all events, was the idea—the dangerous idea—which prevailed among the members of the angling clubs of London—and it was, moreover, stated with indignation, that these Conservators who had thus seized upon the waters by setting up their claims had substantiated their claims by themselves, in their position as justices of the peace, convicting persons of trespassing for fishing in the waters of the Thames, and this too, without entering into the question of title.

Mr. Vansittart, interrupting, said that there was a mis-statement in this, for he had sat upon the bench in these cases, and they had only been decided after anxious deliberation—in all cases, too, the justices had offered to “grant a case” when the question of title could be gone into. The offer of a case had not been accepted.

Mr. White was not surprised at the offer of a lawsuit being refused by individuals, and was satisfied with having elicited the fact that Conservators who had themselves these claims, had been judges in the cases in which they were interested.

Sir F. Nicholson said it would be as well if the Thames Rights' Defence Association would send their views in writing.

Mr. Francis said this should be done.

The Deputation then withdrew.

THE BROADS AND RIVERS OF NORFOLK AND SUFFOLK.

PART II.

NORFOLK was a stronghold of decoys, and there are still as many as six in active operation. Very few persons have actually seen decoys; for as the greatest quietude is necessary in order to give the ducks a sense of security, the presence of visitors is not encouraged at any time, and the greatest mystery and secrecy are observed about a decoy. Briefly speaking, a decoy may be said to be a pond or lake from which shallow creeks or arms branch out like the arms of a star-fish. These arms are curved so that the ends are not visible from the lake, and are arched over with network, forming pipes which lessen in size until at the end there is a kind of removable pocket. No gun is allowed to be fired within the neighbourhood of the decoy, and the fowl rest there during the day in, as they fancy, unassailable security. But from behind a screen of reeds the decoy-man, who holds in his hand a bit of smouldering turf to prevent his own odour from reaching the birds, gives a low whistle. On the pond are several tame ducks, which know that food is ready for them at the mouth of the pipe, whence the sound proceeds. These swim quietly towards the hidden decoy-man, and are followed by the wild birds. Then a reddish-coloured dog jumps through a hole in the screen, and back again through another. The ducks are immediately brimful of curiosity, and swim to inspect this curious creature. The dog reappears a little way up the pipe, and the ducks follow. When they are well inside, the decoy-man presents himself at the opening, and the frightened crowd flutter into the pocket, and are captured. From one to two thousand birds might be taken in one season. There are two sets of decoys on Fritton Broad—one worked by Lieutenant-Colonel Leathes, and one by Sir Savile Crossley. Those who are interested in the subject of decoys should read an article upon Norfolk decoys, by Mr. Southwell, in the Transactions of the Norfolk and Norwich Naturalists' Society for 1878-79.

The Broad district is not so rich in wild animals as a drier and more thickly-wooded country would be. The only one worth our notice now is the otter, which is very numerous although not often seen, on account of the pathless forests of reeds which afford it ample scope for unseen rambles. Once in an alder-cart a friend of ours came upon three together and shot them all. Frequently, when lying awake at night on board a yacht, we have heard its bell-like bark close by us, and in the morning have found some large bream lying half eaten on the adjacent “rond.” Formerly, as may well be imagined, they were much more abundant; and in the year 1557 the “Norwich Assembly for the fresh-water fisherman between the Tower at Conisford and Hardley Cross” made a regulation, “That every man shall be bound to keep a dog to hunt the otter, and to make a general hunt twice

or thrice in the year, or more, at time or times convenient, upon pain to forfeit 10s.” And in 1729 we read in the *Norwich Gazette* that, between the 18th March and the 20th of May of that year, certain Suffolk gentlemen killed seventeen brace of otters by hunting them. The usual breeding-place of the otter is in some hole beneath tree-roots or rocks on the margin of the water; but as such spots are rare on the Broads, the otter accommodates itself to circumstances, and builds itself a nest in a reed-bed on the ground, raising a hillock of weeds and rubbish as big as a haystack, in the centre of which is a chamber approached by two or more entrances. The otter is often caught in the large bow-nets which the Broad-men set for tench in the “runs” between the weeds. Otter-hunting with dogs in the lower reaches and Broads would be useless, as the extent of water is so great that the otter would have a great advantage over the dogs, and the hunter could not follow dogs and otters into the reed-beds.

Of the fish with which these waters are teeming, so much can be said that it is difficult to select that which must go into the small compass at our command. The bream deserves first mention, because of its enormous numbers. It is everywhere, and attains to a large size. Four and five pounds are now not uncommon weights, and one of eleven pounds was recently caught. The Norfolk bream-fisher is *sui generis*. You generally see them two in a boat which is moored parallel with the stream, each man with an apron and a cloth. The bream is covered with such a thick slime that were it not for these precautions the angler's clothes would be irretrievably ruined. Handfuls of brewers' grains are thrown in from time to time as ground-bait, and every swim produces a bite, so that at the end of a good day there may be from five to eight stone weight of bream and roach in the boat. The artisan classes of Norwich are great bream and roach fishers, and frequently have fishing contests,—generally under the patronage of Saint Monday. On such noisy and festive occasions, however, the sport is generally comparatively poor. The bream is not a very toothsome fish to eat, but large quantities are sold by the professional fishermen to the poorer Jews in our large towns for use on fast-days, of course at a very cheap rate; and many bushels are sold to the fishermen on the coast for use as bait.

Of the large quantities caught by the angler few are eaten. After the catch is weighed it is cast away, and one often sees rotting heaps of fish on the banks. Tons have been used as manure, but these were the produce of an infamous system of poaching which prevailed before the passing of the Norfolk and Suffolk Fresh Water Fisheries Act in 1877. The poachers dragged the rivers with small-meshed nets, and even trawled up them just as is done at sea; and as many as eight tons of fish would be the produce of a day's or night's netting. When the price obtained for these would not pay for the carriage, they were simply thrown away. Now, however, there are regulations as to netting, which have put a stop to this, and the fisheries are fast becoming better than they have been for a long time. There is no restriction against rod-fishing at any time of the year in the free waters, which comprise the three rivers,—Wroxham, Oulton, Fritton, and Ormesby Broads, and Breydon Water.

The roach almost equals the bream in point of numbers, and is caught of a uniform large size. The rudd, or roud, as it is generally called in Norfolk, is very abundant, more particularly in the Broads. It is a brilliant-coloured active fish, and will rise at the fly, so that a day's roud-fishing is a most enjoyable experience. The carp is not common, but grows to a large size. Mr. Lubbock mentions one which was caught in Belaugh Broad of the weight of 15½ lb. Perch are numerous and large. Four-pounders are frequently taken; and on the Waveney a barber of Beccles took in a short space of time one morning eleven perch,

each 2 lb. in weight, and no small ones. The fresh-water shrimp is the favourite bait for them.

The tench is common and large. It is not often caught by the angler, because the bream and roach will rush off with the bait while the tench is deliberating about it; but they are caught in great numbers by means of the bow-net. A bow-net set just below the town of Beccles had sixteen brace of fine tench in it when taken up. The attraction in this case was a bright-coloured bunch of flowers fastened inside. Great numbers, however, are taken in a very peculiar way. In the hot days the tench lie on the surface of the water in shoals. On the approach of the Broad-man in his boat they disperse, but only for a few yards, until they can hide themselves in the weeds in some shallow spot. The man notes where some of the fish go, and, paddling quietly up, he bares his arm and feels for them. Unless the fish is touched on the tail it will not move until it is lifted right into the boat; and in this manner five or six dozen fish, over fourteen inches in length, may be taken in a day.

The eel and the pike are now, however, the chief "paying" fish in these waters. The eel is the support of numbers of fishermen, who "bob" for it with bundles of worms threaded on worsted, in which the eels' teeth get entangled; spear it in the dykes and along the shallow margins; set eel-pots; and net it in a variety of ways. On the Bure, large nets are set across the river during the autumn nights to catch the eels making their annual migration to the sea. Immense catches are made on dark and stormy nights, when the eels are most on the move. Some of the eels are sold in Norwich and Yarmouth, but the greater number go to Birmingham and the Black Country, where such rich food is apparently much appreciated. Long night-lines with hundreds of hooks upon them, baited with small fish, used also to be set; but the recent Act made this illegal, because pike and other fish were often caught on them. The poachers trawling up the Waveney have taken ninety stone of eels in a week, although eels are the most difficult fish of any to be caught with a drag-net. After the last summer floods the eels were greatly on the move; and the men who sat and "bobbed" just below Norwich would get four or five stone weight in a single night, which would sell for ten shillings a stone.

The pike is the monarch of the Norfolk waters, and at one time was supremely abundant, but the natives harried him to their utmost. Liggers or trimmers made of bundles of rushes were set by the hundred. The smaller Broads were hired by fishermen, who, to make a livelihood out of them, caught all they could. Yarrell, in his "British Fishes," gives an instance of a few days' slaughter of the pike on Heigham Sound. Mr. Lubbock instances ninety pike, many of them of large size, being taken on Ranworth Broad by two amateur fishermen in the same boat in one day. Lately, on Scoulton Mere, twenty-three were taken by trimmers, five of them weighing over 20 lb. apiece. Nets and set-lines and snaring in the dykes at spawning-time thinned their numbers, so that both in quantity and size pike were slowly but surely decreasing. Since the Act was passed, however, there is a great improvement in the pike-fishing. Only the other week, one of forty-three inches in length and 27 lb. in weight was caught at Cantley, on the Yare.

In Oulton Broad are great numbers of the grey mullet, which, however, will not take any bait that the angler can offer them.

In the spring the smelt comes up the Yare to spawn, and is stopped in its course by the New Mills, which are built right across the river, in the city of Norwich. Just below the mills, in the heart of the city, the smelter passes the night in his boat, throwing a huge casting-net, by the light of a torch, and occasionally making large catches. Lubbock says: "It is a curious fact that other fish greatly forsake the higher part of the river whilst

it is occupied by the smelt spawning. Roach and dace are at that time very scarce, although plentiful enough before the smelts arrive; they then remove further down the river for a time; and, as they say here, 'the fish are down because the smelts are up.'"

There is a large and constant traffic on these waters carried on by means of wherries. These are sailing craft of from 20 to 70 tons burthen. They are long and shallow, have one tall mast and a huge sail, the rig being on the principle of that known as the Una rig, except that there is no boom. Two men, or a man and a boy, or his wife, or even one man only, suffice to navigate these large craft. They sail fast, very close to the wind, and are handy. There is a little cabin in the stern, and abaft of this the steersman stands against the tiller, with the sheet working on a "horse" on the top of the cabin just in front of him. The mast moves on a fulcrum, and the lower end is weighted, so that by means of the forestay one man can easily lower and raise it: When the wind fails, the men betake themselves to the "quant," which is a long slender pole with a knob at one end and a spike and shoulder at the other. The shoulder is to prevent the quant sinking too far into the mud. The wherryman plunges the quant into the water at the bow of his craft, and placing the knob against his shoulder walks aft along the plankways pushing with all his might. Many an amateur yachtsman has found this part of the business easy enough; but when trying to withdraw the quant, he has discovered it to be so deeply imbedded in the mud that he has failed to extract it, and after a last agonising pull has either let it go altogether, or, if his sense of duty was too strong, has stuck to it until his craft has slipped from under him and he has had a good sousing. The quant must always be laid with its point towards the stern, and the boathook with its point towards the bows, otherwise bad luck will attend the voyage. The men are paid by the voyage; so that a fair wind means money—a head wind, less money—and a calm, loss. Owing to the winding course of the river there are always some reaches which can be sailed without tacking. The men will often lose an hour or two of a fair wind or tide in order to wait for and race a rival wherry; and at the various regattas there is frequently a wherry-race which produces much noise, fun, and excitement. In the winter a wherryman's life is a very hard one, but there is but little actual peril; they are such splendid steersmen that accidents rarely happen. They stick in the mud occasionally, but this simply means a little extra pushing. Occasionally a "rodges-blast" sweeps like a whirlwind over the marshes, lifting the reed-stacks, wrecking windmills, and dismasting the wherries; but this is not of frequent occurrence. We have failed to trace the etymology of this local name for a rotatory wind-squall. There are a large number of men employed in this kind of navigation, and as a rule are sober, honest, and civil men, ready to give any assistance in their power to the yachtsman. A great weakness of theirs is a fondness for tea. This they boil in the kettle which they say never "furs." The wherries are built entirely of English oak, and a large one will cost about £500.

(To be continued.)

ANGLERS should always be provided with something to take away the swelling and poisonous effect of the bites of insects. They should also have with them something to apply to a cut or sprain. Pond's Extract reduces the swelling and inflammation, stops bleeding and pain, and hastens the healing process in case of any wound or sprain; and it has no equal for application to the bites and stings of insects. Therefore never go on a fishing excursion unprovided with a bottle of Pond's Extract. It is for sale at all chemists, at 2s. 3d., 4s. 6d., and 8s. 6d. per bottle.—[ADVERTISEMENT.]

TIED HANDS AND ARMS.—Edson's Electric Armlets and Wrist Bands. Invaluable for anglers and gun sportsmen and highly recommended for all persons having tiresome writing, sewing, or music practice. They give wonderful energy and strength, enabling the wearer to accomplish tedious work with steadiness and comfort. Price 2s. 6d. per pair, silk web and fine steel clasps. Sent to any address on receipt of P.O.O. payable to J. Edson, the Electric Fabric Co. Patentees, No. 1, Charlotte Street, Bedford Square, London W.C.—[ADVT.]

CARE OF FISH POND.

AS an instance of the tender care which fish require, some idea of the work to be done in January is here given.

The inflow and outflow channels of fish-ponds must be constantly kept clear of ice and the snow partially removed to afford a necessary amount of light. The main surface of the pond, however should be left undisturbed, since snow helps to keep off extreme cold. When the ice bears, air-holes should be provided, and these should be sawn, not chopped. To protect these from further action of the frost, thin poles should be laid athwart them, covered with a thin layer of branches, straw, reeds, or rushes. On no account should the air-holes be made above the spot where the fish have congregated for the winter, and the most suitable position for them is at opposite ends of the pond, close to the in and out flow, so as to ensure a maximum aeration of the water. The air-holes must be examined daily for signs of the dispersion of the fish; these are discoloration of the water, the appearance on the surface of dead water-beetles and spiders, or fish gasping for air. Should these un hoped-for signs occur, the number of air-holes must be largely increased, and as much circulation as possible given to the water. If these measures prove unavailing, and there is no immediate prospect of thaw, all that can be done is to net the pond and transfer the fish to other and better water. All noise on the ice, such as that caused by cutting ice for storage skating or sledging, is to be avoided, otherwise the fish will be roused and tempted to rise to the surface, where, in all probability, they will freeze fast to the ice, and die in consequence.—*Donker's Fischerei Kalender.*

THE LIFEBOAT SERVICE IN 1880.

THE list of the services rendered to shipwrecked crews by the lifeboats of the National Lifeboat Institution during the storms of the year which has just closed show a total of 570 lives and 29 vessels saved from destruction. In the same period the Lifeboat Institution granted rewards for saving 120 lives by fishing and other boats, and other means, making a total of 690 lives saved last year, mainly through its instrumentality. Altogether, since its formation the Society has contributed to the saving of 27,596 shipwrecked persons. It should be mentioned that the operations of the National Lifeboat Institution now cover the whole coasts of the British Isles, and that all the lifeboats of the United Kingdom belong to it, with the exception of a score or so of lifeboats which are under the charge of harbour trustees and other local bodies. It will thus be seen that an institution possessing so national a character must necessarily need a very large income to carry on its truly benevolent work with the success which has hitherto characterised the operations of the National Lifeboat Institution. We are therefore not assuming too much in expressing a confident hope that the British public will continue to extend to it their sympathy and liberal support. We will only add that contributions are received for the Lifeboat Institution by all the London and country bankers, and by the Secretary, Richard Lewis, Esq., 14, John Street, Adelphi, London.

GREGORY'S SPINNING BAITS.—"The Gregory," the "Flexible Cleopatra," the "Oxford" and the "Colorado," pronounced by all Anglers and the Press the best baits invented for salmon, trout, pike, and perch. To be obtained from all respectable fishing-tackle shops in the world, and wholesale from Messrs. S. Allcock and Co., Standard Works, Redditch. Flattering testimonials speaking of the efficiency of the baits have been received from the Right Hon. John Bright, M.P.; Mr. William Bailey, Nottingham; the Rev. E. C. Holt, Teddington; Sir William Calder, Kingston-on-Thames, &c. Gregory's registered Archimedean spinning tackle for pike and trout, now ready, is pronounced by the press the best ever invented. For use with dead bait. The tackle is complete in every respect, and can be adjusted to suit bait of any size. Has been tried with remarkable success.—See that the name "Gregory" is impressed on the Archimedean fins, as inferior imitations are offered for sale, and people are thereby disappointed and deceived Address, James Gregory, Vyse-street, Birmingham.—[ADVT.]

MRS. F. Y. BROCKAS, Artificial Fly Dresser, 4, Mill-street, Conduit-street, Hanover-square, London, W. A stock of best flies always on hand. Flies made to pattern. Lessors in fly making given.—[ADVT.]

CORRESPONDENCE.

[We do not hold ourselves responsible for opinions expressed by our Correspondents.]

CURATORSHIP OF THE BUCKLAND MUSEUM.

SIR,—I am informed that efforts are being made to turn out the present curator of the Buckland Museum at South Kensington in favour of another individual. Having for many years known this museum and its contents, I think any petition to turn out its present curator would be very unjust and wicked; as he has virtually made it the success it now is.

I do not think any petition will have the slightest weight with the authorities of the museum, since Mr. Edon, the present curator, has given, and is giving, every satisfaction in the performance of his duties. Mr. Edon has done a very great amount of good to our inland fisheries, by giving sound and trustworthy advice to all those who, like myself, in former years, sought his advice in piscicultural matters. In fact, had it not been for his advice and assistance, I much doubt whether I should ever have made fish-culture the success it now is; therefore I think it would be a great shame to seek to turn out a worthy public servant.

I can only speak most highly of him so far as I know, and I think I know him as well as most people can.—I am, &c., CHAS. C. CAPEL.
Cray Fishery, Foot's Cray, Kent.

WHEN DO TROUT SPAWN?

SIR,—I shall be extremely obliged if you will let me know when trout begin to spawn, and when they finish, and how deep ought the water to be, and what is the best material to make a spawning-bed of? I have a reservoir near me, and I am very anxious for the trout to spawn in it and not outside where the poachers can get at them.—I am, &c., R. H. B.

Jan. 9th, 1881.
[Trout spawn in the winter months, generally in November, December, and January, but there is no fixed time; for instance, the Itchen trout are spawning now and the Wandle trout won't spawn for some weeks probably, and the Otter (Devon) trout spawned some weeks ago. If there are streams running into your reservoir the trout will get into them to spawn if they can, if they can't they will have to select the most shallow part of the reservoir. A good gravel bed is the best material for the purpose.—ED.]

DANGER TO EPPING FOREST.

SIR,—Surely the publication of Mr. Heath's letter on the above subject in the GAZETTE is very injudicious. Every angler must be aware from very obvious reasons that anglers, as anglers, must not enter into public quarrels with the railway companies. The Great Eastern least of any. My sympathies are entirely with Mr. Heath, but let him remember that there are more ways than one of killing a cat.—I am, &c., A. J. MARRIOTT.

Jan. 10th, 1881.

FISHING IN THE TEME.

SIR,—With your kind permission I will give the anglers of Worcester and neighbourhood forty-five years of my experience of the river Teme, or Teame; but first let me tell them my catches this season. I began as usual in April with the worm bait for trout, had the usual success until the season came for my best and favourite bait, viz., gentle, maggot, or young of the blue-bottle fly. After catching the usual heavy baskets of fish, all sorts that take that bait, I began grayling fishing about the middle of August, and on each Thursday until November was out, my total catch was 307 grayling, besides many good dishes of trout in August and September. The account of each take appeared in your paper weekly. About forty-five years ago, just after the new bridge at Powick was erected, I was considered a successful young angler. I having copied one Mr. Allen, who was a famous maggot fisher, always keeping a good and liberal shop of bait, and thus attracting the fish to him. It was common to catch a basket full of large dace in Diglis, or anywhere about the Severn, but after the locks and weirs were put on the Severn, it changed the river as regards fish and fishing. I could catch good baskets of trout and other fish at Powick or Lower Teme, but after a time that got worse, and I went higher up the stream to Bransford. Had good sport there, and on up to Cotheridge and Broadwas. There I met with better fish and plenty of them. I fished that water for years, and have seen twenty long fishing rods reared against the village inn—the Royal Oak—at one time, showing there was plenty of anglers. One day after I had been broken by either fish or bottom until I had no float left, the fish biting well, I picked up a cork, and with my pocket-knife cut into it, placed a quill in the middle, and tied it on with waxed silk. It appeared longer than the float then in common use, and something new to look at, but acted very well as substitute. From that time I have always used the long float, and is has come into general use with bottom anglers. It is called by the fishing tackle makers the Worcester float. I then went up the river to Knightsford Bridge, where the host has the right to give leave to customers to fish two miles of good water. Here I had very good success, catching heavy baskets of fish. To decide a bet one day's catch was weighed at the inn, and 46 lb. was the weight I caught. I still went higher up the river, and found it even better fishing, and at Martley I have had great takes of fish. Kingswoodford is famed for grayling. Up the river to Shelsley and Stanford, I met with the same success, Stanford Bridge Inn being a capital fishing station. Here I heard that the fish were larger up the stream. I, of course, went on higher up to Meadows Mills, where I had grand sport with grayling and trout. A mile above begins the fords of the long reach between mills, called Newnham and Tenbury water. Here it was I caught a dace a pound weight, the first I ever saw, and I would not believe it until I saw it; but I was agreeably deceived. It was a common affair to catch dace up to 18 oz., but that is a thing of the past. My opinion is that otters have cleared the river of them, and most of the best fish. At this time I walked to and from Lindridge carrying heavy baskets of fish home seven-teen miles, after a hard day's fishing with a 20 ft. rod. Few men do such things. After some years I took parties to the Nag's Head, Lindridge, and it became heavily fished up stream. I went and fished the Tenbury club water by ticket. Here I found the fish plentiful. I now drove horse and trap, and put up at Newnham Bridge, or the Peacock, both good and convenient fishing stations. Mr. Smallman, the host at Newnham Bridge, is one of the best top water anglers I ever met with. Jolly John Jones, at the Peacock is as good as his wife, which is saying a lot for him. The next fishing station is the Swan

Hotel, Tenbury, close to the water. Higher up stream at Little Hereford leave may be obtained, and there are good baskets of fish to be taken up to Barratt's Mill. The Selway Arms at Wooferton is a good house to stay at. Up stream to Ludlow and on to Oakley Park is getting on to the best grayling water on the Teme, strictly preserved. From here to Leintwardine up to Knighton the river is small, trout only going up higher; but up the Clun, a river that runs into the Teme, there is good trout and grayling fishing, all preserved. I have had an occasional visit to that stream, and can testify to the quality of the fish. There are tributaries running into the Teme that contain fish. The best to fish in is the Leigh Brook, the river Rea at Newnham Bridge, the Letwich at Burford, above Tenbury, and the Oney, near and above Ludlow. Plenty of sport can be had on these streams. The railway runs to all these places, except Stanford Bridge. With permission I will shortly give you readers a paragraph on the river Lugg and other streams where fishing is worth going for.—I am, &c.,
B. SMITH.
Jan. 5, 1881.

EXTENSION OF TIME FOR CHEAP TRAVELLING ON RAILWAYS.

SIR,—The above has for some time past been a matter of discussion at the clubs belonging to our Association, as also at our delegate meetings held quarterly, and it is the general opinion that in long journeys by rail an extension of time is most desirable.

The different railway companies at present allow our members to travel on their lines at a reduced rate of about a fare and a third, but no distinction is made as to the distance of the journey, three days being allowed for an outward journey of a dozen miles, and the same for a journey of eighty miles and upwards.

A deputation was appointed to wait on the managers of the various railway companies, to see if they would grant an extension of time from three days (as at present) to six days for all distances where the outward journey exceeded forty miles. The result being that the matter, about four months ago, was brought before a meeting of the managers of the different railway companies, and they decided to decline an extension of time, although I have been informed by the secretary to one large company that he hoped before long to be able to see his way to grant the same.

Now our Association embraces Clubs in the following districts:—Bolton, Farnworth, Oldham, Rochdale, Salford, Heywood, Patricroft, Stockport, Hooley Hill, Ashton-under-Lyne, Hollinwood, Pendleton, &c.; and to go to anything like a place for good fishing our members have to travel a long distance, viz., into Lincolnshire, North Wales, Shropshire, &c., and after journeying there in one day, you have very little time left for fishing; and on the third day you have to give up very early in order to get back again; so that, out of three days, you have about a day and a half fishing. This is considered too little by our members, who think it hardly worth the trouble and expense of going so far in so short a time, whereas, should the time be extended, I am certain it would be better, both for anglers and the railway companies, as many more would travel on their lines than at present.

Again, on arriving at your destination, you may find that the wind and weather are against you for sport, and have the pleasure of knowing that, had you been able to stop another couple of days, you would have been able to have had, in all probability, a very good catch of fish, instead of returning with an empty pannier.

I do not know whether the matter has ever been mentioned at any of the London or Provincial Clubs, but, thinking it would (if they have not already such a privilege) also be a benefit to them, I have been desired to write this letter, and should feel extremely obliged if the secretaries of the various clubs in London, Sheffield, Birmingham, &c., would kindly test the feeling of their members on the subject, with the view of a general application to the various railway companies at a meeting of their managers, which I believe takes place in London every month, and then they will see that an extension of time for travelling long distances for bona fide angling is a matter that is not desired by Manchester alone, but also the various angling clubs in England.

Trusting you will kindly give space for this letter in your valuable journal, I am, &c.,

H. JOHNSON,
Secretary to the Manchester and Districts
Amalgamated Anglers' Association.

13, Whitfield Street,
Hyde Road, Manchester, Jan. 11.

A CHUB QUERY.

SIR,—Will you, or any of your readers that are practical chub fishermen kindly inform me how to use pith and brains for chub, whether it is boiled, or how made to stop on the hook; also how far to fish off the bottom. We have heard that there are thousands of chub in the Avon between Keynsham and Saltford, but we have never caught, or seen any that have been caught in the place named above, yet it is believed there is plenty there. I well remember one day, when roach fishing with gentles, the rouser I hooked, but could never see it, and it finally escaped by breaking my tackle. A friend of mine also fishing the same water, some time ago, for roach, with paste, says that when a roach did bite he had it, but when a chub took the bait he could never hook it do what he would. If any practical chub fisherman would be so kind to inform me as to the use of pith and brains, I should esteem it a great favour.—I am, &c.,
THOS. DAVIS.

Kingswood, near Bristol.

A PERSONAL MATTER.

SIR,—In your last number the "Raven" makes an onslaught on your humble servant in language he would never have dared to use had he not felt sure the controversy on the parr question was closed. His tone reminds one of the old legal dictum, "You have no case—abuse the attorney on the other side." First "Raven" accuses me of falsifying his words. Well, I quite agree with him that the intentional insertion of the word "than," whether in "Raven's" or Parnell's description, would be most dishonest. But it was not intentional in my case—I did not receive the FISHING GAZETTE till Monday, on the occasion of writing this letter, and letters have to leave here on Monday afternoon to be in London next morning. In my hurry I did not notice the rest of the sentence, and being misled by "Raven's" bad punctuation: i.e., "Pectoral larger and stronger, standing out in the salmon;" I supposed he was comparing the two. Hence the error, which, by the bye, makes "Raven" more in agreement with his "authority," Couch, than he really is.

As you have decided that this questionably useful controversy must close, I abstain from noticing "Raven's" so-called arguments, but two statements he makes are positively untrue. I never said I had caught parr with "almost white-coloured," nor did I ever say in my original letter, that "Yarrell was describing the samlet under the name parr."

As to the description of the parr given by Parnell, neither Couch nor Yarrell, both of whom give his description, saw that he "plainly made a caligraphical error when writing his description:" that discovery was reserved for the critical acumen of the "Raven."

Hoping you may find this letter admissible, I am, for the last time,

T. SPENCE.

DOBB'S WEIR FISHERY.

SIR,—Dobb's Weir Fishery, known as Cook's, Fish and Eels, Hoddesdon, has been taken by the United Society of Anglers. No day tickets will be issued.—I am, &c.,
G. H.

NEW KINDS OF NET FISHING FOR HERRING ON THE EAST COAST.

SIR,—I have made full inquiries about Mr. E. Gostling's query in yours of the 1st inst., and cannot find out the slightest foundation for the statement he refers to.—I am, &c.,
ESOX LUCIUS.

CLUB REPORTS.

ALEXANDRA SOCIETY OF ANGLERS.

On January 9th Mr. E. Brocket came to the front with a fine tray of roach; Mr. C. Hewett next with a nice show of the same fish; Mr. T. W. Thompson, bream; Mr. J. Blacklege, roach; Mr. J. Morgan, roach; Mr. W. High, roach. Mr. Harnet just saved us from a blank the Sunday before with a few roach. On the 16th the members will fish from Waltham Bridge to Cheshunt Lock for several prizes given by the following gentlemen:—Mr. Shepherd, one of Mr. Sourbuck's handsome roach-rods; Mr. J. Morgan, a fine case of birds; Mr. M. Dymond, a prize not named; Mr. G. Castle, a set of handsome vases; Mr. Philpot and Mr. T. Gipton, prizes. On Tuesday, January 18th, a few members of the above will meet to give an old friend a turn, Mr. W. Hart, who has been laid up some time and needs a few friends at the present hour of distress; chairman, Mr. High. You will find me in the vice-chair.—C. HARTLAND, sec.

AMICABLE BROTHERS ANGLING SOCIETY.

I have the honour to inform you that the next general visit of angling societies will take place at the Bald-Faced Stag, Clifton Street, Worship Square, Finsbury, on Monday, January 17. This is the first visit since our worthy host has the above house, and as he takes a great interest in the club and angling generally, we wish to give him a bumper, which we shall be very pleased to return. Chair to be taken at 8.15.—J. WORLEDGE.
Jan. 6.

BRIGHTON ANGLERS' ASSOCIATION.

The members of the above association had a contest on the gins in the River Ouse for several prizes. The following gentlemen were the prize-winners:—Mr. W. Saunders, with pike 9 lb. 14 oz.; Mr. Hassell, pike 4 lb. 4½ oz.; Mr. Ollive, pike 3 lb. 7½ oz.; Mr. Tompkins, chub 1 lb. 2½ oz., and several minor catches.—J. G. ANSCOMBE, Hon. Sec.

BRISTOL GOLDEN CARP ANGLING ASSOCIATION.

At our monthly committee meeting held at the White Hart Hotel on Monday, January 3rd, it was brought forward that a member of the committee had started a new angling club under the name of the Bristol United Angling Association, and that he informs its members that they will in 1881 be amalgamated with the aforesaid Bristol Golden Carp Angling Association. This is to give notice that the committee are determined not to extend its numbers. Neither have they given any one any authority to sell tickets on their behalf otherwise than their hon. secretary, Mr. L. Wride, from whom all information can be obtained. It was also proposed that any member of the committee being absent three consecutive lodge nights shall be struck off the list, and another elected in his place. Arrangements are being made for fishing water, and we hope to get a definite answer in the course of a week or two.—LEWIS WRIDE, hon. sec.

THE DALSTON.

On the 4th inst. Mr. Fortescue brought up 21 lb. 2 oz. roach, the result of his day's fishing in the Colne, twelve of the largest fish weighed 10 lb. 3 oz. Mr. Hollingsworth had 6 lb. on the same day. On the 6th inst. Mr. Fortescue was again to the fore with 10 lb. 2 oz. roach, perch, and dace; and Mr. Eagles had 8 lb. 6 oz. roach, also from the Lea. Several other members had smaller takes of roach and dace.—W. L.

GOLDEN BARBEL.

On the 26th December, 1880, Mr. Dick visited Marlow and succeeded in getting some nice roach. On 27th December, 1880, Mr. E. Harrison and J. Green paid a visit to Father Thames. The former managed to get some roach, perch, and a tench turning the scale at 3 lbs. 4½ oz., and the latter, about 5 lbs. of roach. January 9th, E. Harrison, roach, perch, and dace; C. Harrison, roach; G. Lumby dace and chub; E. Lawford, dace and chub; J. Green, roach; T. Lee, roach; E. Henries, jack, roach, chub, dace, and perch. Gross weight about 30 lb., contributed by the Thames and Colne. Two pounds of tobacco will be given to compete for on the 16th.—PIXIE.

GOLDEN TENCH.

On Sunday evening last there was the following show at the above club. Messrs. Higley, Byden and Flower took from the Lea three brace of jack and a splendid tray of roach and perch, total weight 22 lb. 3 oz.—T. S. WEBB.

HAMERSMITH UNITED.

On the 6th Mr. Geen succeeded in making a show of chub and barbel from Shepperton; Messrs. Cook and Hobden also weighed in roach from Bourne End. On the 9th Messrs. Senney and Hitchcock journeyed to Wraybury, from whence they brought in a few roach.—VORTEX.

SIR HUGH MYDDELTON ANGLING SOCIETY.

Your humble servant and two members of this Society ventured out roach fishing on Sunday last, the morning was beautiful for the time of year. The little Iver looked in splendid order for roach fishing, and we fully expected a good take; our expectations were not, however, realised. After sitting for an hour and a half without a nibble, our extremities getting very cold, we tried another swim, and there met with a little better success. G. Caborn, roach, 2 lb. 3½ oz.; G. Rogers, roach, 1 lb. 15½ oz.; B. Duncan, roach, 1 lb. 13½ oz. The Society have removed their place of meeting to the Empress of Russia, St. John's Street Road, opposite Carter's fishing tackle establishment, were all communications, &c., may be addressed. I may also tell my brother anglers that the Society intend making a complimentary visit to our new quarters, to initiate our worthy host and hostess into the mysteries of anglers and angling. Due notice will be given as to the probable date of this taking place.—G. CABORN, Secretary.

PRINCE OF WALES ANGLING SOCIETY.

You will greatly oblige me if you will insert a notice of removal of this society to the Victory, Newnham Street, John Street, Edgware Road, and inform our brother anglers that the members will make them welcome at their new home.—E. HINTON, sec.
Jan. 10.

SURREY PISCATORIALS.

On Friday, the 7th, Mr. Francis, a member of the above, was out with Mr. Boalch at Richmond, and succeeded in taking a nice show of roach and dace. A short time ago I observed an enquiry as to a society which did not entertain Sunday fishing. I beg to inform that correspondent that the above society do not allow Sunday fishing. For rules and further information, please address Mr. Whitby, Secretary, Surrey Piscatorials, the St. Paul's, Westmoreland-road, Walworth.—PIXIE.

January 11, 1881.

WALWORTH WALTONIANS.

On Friday, the 7th, the members of the above competed for three prizes. The undermentioned were the winners:—Mr. Boalch first, with nearly 8 lb. of dace; Mr. Weatherhead second, about 5 lb. of dace; and Mr. Evans third, with dace from Richmond. The next competition will take place on the 23rd instant, for half-sack of flour, given by Mr. Blows; a box of cigars, given by Mr. Swan; and several other prizes given by various gentlemen. Now the long evenings have arrived, the members are requested to attend earlier on Friday evenings, for the purpose of discussing special business and harmony. Several gentlemen whose vocal abilities have given great satisfaction on previous occasions have promised to attend.—PIXIE.

January 11, 1881.

CULTIVATION OF INDIGENOUS AQUATIC PLANTS.

AQUATIC plants, when massed in quantities, always present a most beautiful and surprising sight, and their somewhat protracted flowering-time makes them especially deserving of careful observation and notice. Chief among them is the white water-lily (*Nymphaea alba*) and the much less rare yellow water-lily (*Nuphar lutea*) or brandybottle, as it is vulgarly named. The seed-capsules of these plants ripen in September, at which time the seeds should be gathered and carefully preserved until the following spring, when they may be set to germinate in medium-sized pots. The best soil is a bottom layer of one-third of the depth of sandy loam followed by two-thirds of pond mud, though the latter should not be of a character either too stiff or too heavy. The seed should be lightly laid on the surface or just below it. A simpler method is to transplant the young plants, as they may be readily found growing in many waters in the spring-time. In this case, however, care must be taken that the depth of water in the pond to which the young plants are to be transferred corresponds with that from which they have been removed, and that plenty of soil is left clinging to the roots.

The notorious river-pest, the Canada weed (*Anacharis Alsinastrum*), to whose presence many waters are much indebted for the great increase in the number of their finny inhabitants, requires a soil of calcareous description; equal layers of garden loam and chalk with a thin sprinkling of sand above is best for the purpose and the roots of the weed should be imbedded singly in the central layer. With this treatment a compact mass of impenetrable vegetation will be formed in a very short while, serving as a welcome refuge for every variety of aquatic life as well as in some instances for food. The little upright white-grey and pink flowers which often cover the whole surface of the water make their appearance in June and July, but on account of their extreme fragility, do not well bear transportation.

Hornwort (*Ceratophyllum*) covering the bottom thickly will rarely be difficult to find. This plant, as is well known, throws out aerial roots and also propagates itself in this way with tolerable rapidity. If planted in well-washed river-sand, its luxuriant habit is easily kept within bounds, but if required to bloom, richer soil must be provided. In many respects the less widely

distributed milfoil (*Achillea millefolium*) with its leaves cut into a thousand segments resembles the foregoing and requires exactly similar treatment.

The featherfoil (*Hottonia palustris*), unfortunately only too tender and fragile, blooms in May. It requires soft water, otherwise its foliage speedily becomes incrustated with carbonate of lime; it thrives best when transplanted into peaty soil.

The water plantain (*Alisma plantago*), arrowhead and sundry other aquatic plants, are best dug out in early summer with plenty of the earth surrounding their roots and transferred to medium-sized flower-pots. In the case of floating plants it is, of course, not necessary to provide them with sunny situations, nor when the stream is at all rapid, must frog-bit (*Hydrocharis morsus ranae*) be expected to grow freely or to bloom. The various kinds of duckweed (*Lemna*) will continue to multiply under every condition and cover the surface as with a light-green carpet.

A simple method of attaching aquatic plants in any situation desired, is by embedding the roots in short lengths of leaden pipe and sinking the latter in position. This plan was exclusively employed at the Berlin Fisheries Exhibition by Herr Georg Deister, of Mayence, who has also in a recent communication to the *Deutsche Fischerei-Zeitung* (from whose columns the above notes are taken) expressed his regret that aquatic plants generally were so completely neglected at Berlin and his hopes that the subject might in future meet with fuller recognition at the hands of those in authority. Perhaps it may be not too much to hope that the matter will be taken up at the approaching East Anglian Fisheries Exhibition, although the early date fixed for the show will unfortunately prevent the display of a full and complete collection of indigenous aquatic plants at their best. Nevertheless, in this, as in everything else, the best that can be done, should be done.

AQUARIUM AND FERN CASE COMBINED.—The whole of the rock-work should be built on a wooden floor, and when thoroughly set should be put into water and remain immersed for at least a month, to season it thoroughly; for new cement is poisonous to fishes, and therefore undue haste in this work tends of necessity to a breakdown. In stocking the tank you need not introduce any vegetation at all, but a clean bed of well-washed pebbles and a few fishes only. But if you wish to have a little vegetation at once plant a few tufts of *Vallisneria* only; if you introduce a variety of water plants you will come to grief speedily. The whole affair ought to be in full working order a month or so before any fishes are put in, and during that time of probation the water should be changed twice a-week at least. We now come to the subject of the fishes. These should be few and small, and of the most peaceable disposition. The lovely gold carp is the most suitable of all, but any other kind of carp may be adopted. Minnows and bleak are suitable, but scarcely desirable, as they soon suffer if the water should be insufficiently oxygenated. Such interesting but delicate fishes as the eel, the stone loach, and the miller's thumb are really quite unfit for the purpose. The principal object is not to secure a zoological collection, but a beautiful object. The ferns will of necessity comprise such as thrive when constantly bathed with moisture, and the filmy ferns, such as *Trichomanes radicans* and *Hymenophyllum tunbridgense* are the best. The small species of *Todea* will answer, as will also our pretty Britishers, the wallrue, *Asplenium rutamuraria*, and the sea spleenwort, *A. marinum*.—*The Garden Oracle*. Edited by Shirley Hibberd.

A PROTECTED BAROMETER.—The fanciful clock face-barometer, which is so great a favourite in England, it at the best a bad instrument, and is so apt to get out of order that very often it is worse than no instrument at all. The simple column is always to be preferred; and to it turn to useful accounts it must be systematically observed, and the meaning of its indications estimated in accordance with the known characteristics and capabilities of the instrument qualified by the observer's knowledge of the district and the ascertained height of the station above the level of the sea. It often happens that the barometer receives a blow from a broom when the housework is in progress in the morning, and we once saw a lively boy smash the tube and let out all the quicksilver in a bit of innocent play that ought to have ended better. We have adopted for our favourite barometer a respectable and substantial means of protection in the form of a zinc case, which fits the instrument as high as the index, which of course, is exposed. This case is attached to the wall by a few nails that can be drawn in a moment if needful, and it is painted black. It is not unsightly, and it not only keeps the instrument safe but delivers one entirely from the dreadful fear of the morning broom.—*The Garden Oracle*, Edited by Shirley Hibberd.

FISHING EXTRAORDINARY.—On Monday evening last, the Duke of Buccleuch, after a few day's hunt, killed within an hour, in the pool close by Monteviot three salmon, two perch, and a pike of 14 lb., with a single gut line. Besides those secured, his Grace ran several other salmon and another large pike; and one of the most remarkable points of the fishing adventure was the recovery of a hook and line in the mouth of a kelt of 8 lb. weight, which again took the hook after having broke away from the first take. As a suitable termination of such sport his Grace at night speared twelve fish in the same pool.—*Sunday Times*, April 26, 1835.

EPPING FOREST.—At a meeting on Saturday last of the Council of "The Epping Forest and County of Essex Naturalists' Field Club," the following resolution was passed on the motion of Mr. Francis George Heath:—That the Council of this Society on behalf of the large section of the population of London interested in the pursuit of natural history, desires to record emphatic protest against the proposal of the Great Eastern Railway Company to carry a line across Epping Forest believing that it is wholly unnecessary for the railway to take the route projected, and that it will not fail to prejudicially affect the advantages secured by the Epping Forest Act, which directs that the forest is to be preserved as far as possible in its natural aspect."

NOTICE.

Communications relating to the Literary Department, Fishing Tackle for Notice, Books for Review, &c., must be addressed to the Editor of THE FISHING GAZETTE, No. 12, Fetter Lane, London, E.C. and should reach the office not later than Tuesday morning.

Contributions are solicited, but the Editor will not undertake to return rejected MSS., unless accompanied with a stamped addressed envelope.

Correspondents are requested to write on one side of the paper only and give their real names and addresses, not necessarily as signatures to their letters, but as a guarantee of good faith. Unless this rule be adhered to no notice will be taken of such communications.

THE FISHING GAZETTE is published every Saturday, and can be obtained at Messrs. W. H. Smith and Son's Railway Bookstalls, and of the following, amongst other Fishing Tackle Dealers in London and the Provinces:—

Messrs. Alfred and Son, Moorgate-street.
Messrs. Price and Co., 8, Seymour-street, Euston-square, N.W.
Messrs. Williams and Co., Great Queen-street.
Messrs. Gee and Co., St. Andrew's-street, St. Martin's-lane.
Messrs. Gee and Co., Gray's Inn-lane (near Holborn end).
Messrs. Little and Co., Fetter-lane, E.C.
Messrs. C. Kewell and Sons, 197, St. John-street-road, E.C.
Messrs. Kewell and Co., 1A, Conduit-street, Regent-street, W.
Mr. J. Richards, 97, Church-street, Faddington.
Mr. W. Leader, 39, Upper Marylebone-street, Portland-place, W.
Mr. — Clark, 35, Wells-street, Camberwell.
Mr. Geo. Read, 91, Goldsmith's-row, Hackney-road, E.
Mr. A. Bulmer, 62, Wandsworth-road.

The Fishing Gazette.

SATURDAY, JANUARY 22, 1881.

REMINISCENCES OF A DAY'S SALMON-FISHING IN NORTH TYNE.

BY AN OLD ANGLER.

SOME years ago—which now, alas! amount to nearly twenty—I held the Admiralty living of Thorneyburn, in Northumberland. The parish was situated on the banks of the Tarsset, a tributary of

North Tyne, in both of which rivers, as also in the Reed, another tributary, I have killed salmon and trout innumerable. There was very little preservation in those days, so I was able to have many a day and enjoy my favourite sport of angling. My belonging to a border clan also was a sufficient introduction to most of the water within a circuit of many miles: so the Rector of Thorneyburn went far and wide, and cast his flies over many streams, and no one said him nay. There was one stretch of water, however, in North Tyne, near Falstone, which belonged to a namesake of mine, and was most jealously preserved by him. It was almost a thing unknown to get a day's fishing in it; however, I at last obtained the coveted permission, but for one day only, and started accordingly one fine morning, accompanied by my son, who now sleeps in a soldier's grave in India. The day was much too bright and calm for salmon-fishing, and I must confess my hopes of success were but faint. There was not above a mile of water to fish in all, and the greater and best part of it consisted in a long sheep-washing pool, about a quarter of a mile in length, deep and dark; the stream slow, and running deepest on the further side, where the bank was built up with large stones. When we reached the river, and I beheld the aforesaid pool presenting an appearance of the most unruffled and detestable placidity, my heart sank within me. However, giving way to despondency was not the way to mend matters, so I got the gear in order, selected a medium-size and rather dark fly, and commenced operations. I fished the pool most carefully foot by foot, from the top to the bottom, expending a couple of hours in the process, without having the ghost of a rise—in fact, not a fin was stirring; there was no breeze, but there was an unmitigated sun which I wished at the North Pole. I came out at the bottom of the pool considerably disgusted, as I knew it was one of the best in the river, and that salmon of 24 and 25 lb. were not unfrequently taken out of it. My son was sitting, smoking on the bank, and on my joining him, "improved the occasion" by chaffing his respected parent, and volunteered the promise he "would carry to the station all the salmon I killed that day." I was too disturbed in mind to make any rejoinder, and sat silently watching the river. At the end of half an hour, the aspect of things improved most materially. The sun kindly went out of sight, and a tidy breeze sprang up, rippling the surface of the pool deliciously. "Here goes again," said I, and commenced again at the head. Before I had fished 50 yards, there was a grand rise and a boil, followed by a heavy tug and a strain upon the line. I could feel he was well hooked, and let him have his own way, which he took with many a frantic rush for a time. Gradually, however, science prevailed over brute force, and after three quarters of an hour's compound of mingled ecstasy and agony (known only to the initiated) I persuaded my friend to come within reach of the fatal gaff, and my boy landed, very cleverly, I must say, a fine clean fish of 13 lb. "There's something, at all events, for you to carry to the station now, my boy," said I, in jubilant tones. The youngster did not crow quite so loud now, as the station was a good mile from the river, but still preserved his equanimity. "Now for another," said I, and just as I was entering the water, I saw a splendid rise a long way down the pool. I marked his *locale* by a stump on the bank: saying at the same time, "I mean to hook another before I reach him." I fished on steadily for a few minutes, and then had another tug, which made my heart leap to my mouth. I struck, and found all right, and after a struggle of half an hour, brought salmon No. 2 to bank, a very pretty fish of 12 lb. It was my turn now to crow, which I did accordingly. "Well, there's a fish for each hand now, my son." A demurrer was now put in by the youngster, to the effect that he "could not carry the fish to the station, if I killed them at that rate." I assured him I should

hold him to his promise, and then went in again to try for the fish I had seen rise low down the pool. I commenced, of course, a good way above him, and fished every inch of water. At last I reached the place where I had seen him rise, and with a beating heart I cast exactly over the spot. There was a tremendous boil, then a heavy tug, and then a furious rush. I never saw that fish from that day to this. For an hour and a half he ran up and down the middle of the pool, deep down in the water, and resisted all my efforts to draw him to the edge. My rod top was double the whole time, and yet I could not get him to the surface. At last my arms began to ache, and I said to my boy, who was standing by my side, gaff in hand, "I'll give him a twitch, and see what he is like." I did so, and gave him a pretty sharp one, when he turned up a tail that seemed to me a couple of feet broad. I could now first discern him under the water, and drew him close to the edge on his side. He was done, and in another half minute he would have been my captive, but I suppose, in the excitement of the moment, I must have slackened my hold, for the fly came out of his mouth, and he rolled away into the depths of the pool. He must have been a noble fish, and very heavy, as my arms and back testified. Need I tell the result? I flung my rod down on the gravel, broke the top short off, flung myself beside, and, like Job, bewailed the hour I was born. Still, I had my two fish to console me, but oh! if that third one had only been added to the spoils of the day, how triumphantly should I have returned home.

J. S. R.

AMATEUR SEA-FISHING.

(Continued from page 26).

FLAT-FISH are ranked under the same head as the cod tribe, viz.:—*Malacopterygii subbrachiati*. The property of this order is, that the ventral fins are placed under the pectorals, and the pelvis is immediately suspended to the bones of the shoulder; and this occurring as well in flat-fish as in the cod kind, accounts for their being arranged by naturalists under the same order; though to the eye of the casual observer, no two kinds of fish could be presented bearing so slight an apparent resemblance to each other.

Between flat-fish and all others there is this marked difference: (1) In the extraordinary formation of the head; the eyes being both placed on the same side. (2) In the flatness and thinness of the body, and the singular difference in the colour and form of the sides—the side on which the eyes are placed being always strongly coloured, and the lateral line strongly marked, whilst the other side is of a uniform whitish colour, and the lateral line scarcely distinguishable; it certainly occasionally happens that both sides are of the same colour, in which case they are called double, but instances of this sort do not occur very frequently. (3) That flat-fish always swim horizontally on one side, with the dark side uppermost. (4) In the absence of the air bladder; though it must be confessed that this defect is not confined to flat-fish alone, as it occurs in the common mackerel.

Flat-fish never rise to the surface, but confine themselves entirely to the bottom, and are usually found on sandy or muddy grounds, where their peculiar form enables them to conceal themselves from their enemies, or to lay in ambush for their prey.

The species of flat-fish that frequent our coasts are (1) the turbot, (2) the brill, (3) the scald fish, (4) the top knot, (5) the whiffe, (6) the plaice, (7) the flounder, (8) the dab, (9) the smear dab, (10) the halibut, (11) the sole, and (12) the red back. Of these the first five have the eyes placed on the left side of the mouth, and in the remaining seven the eyes are placed on the right. Instances, however, have occurred of the eyes being

placed in a different side from that in which they are seated in the rest of their species. The only occurrences of this sort that have come under our notice have been in the common flounder; but we have every reason to believe that it may happen as frequently with any other species of flat-fish, and unless to persons well acquainted with the subject this peculiarity would escape detection.

The turbot being the best of his genus, if not the best fish the sea produces, we must treat of first; and though his form appears so well known, and his merits at the table so duly appreciated, we still consider that a slight description of the former, and a few observations so as to render him as pleasing an addition as possible to the latter, may not be wholly superfluous. Our reason for the first is, that we have often been invited to partake of turbot which, alas! were not turbot even in name, but only by a false reputation. Dealers in fish (of course we do not mean the better class of fishmongers)—we mean the soft and gentle sex—who, though (and with regret we write it) not famous for a good selection of words or epithets, are never known to cry stinking fish, and not unfrequently manage to palm off anything in the shape of a great overgrown flat fish on their inexperienced customers under the exalted name of a beautiful fresh turbot, only just out of the water! Few persons, indeed, not well acquainted with the fish would easily detect the difference between a brill and a turbot, unless they saw the two fish together; but it has not unfrequently happened that even a halibut, a fish wholly unlike the turbot, (except that it is flat, grows very large, and is white on one side) has passed current under the name of turbot—a name, however, we must admit, he has acquired by reputation on the northern coasts of this kingdom; whilst in the neighbourhood of Plymouth the brill, called in the north a pearl, by a change of names just as singular, is termed a halibut. How or why this change of names took place we are wholly at a loss to discover, as there is so little resemblance between them; both the turbot and the brill being remarkably broad in proportion to their length, whilst the halibut is longest of all flat fish except the sole. And now for our reasons for offering our observations as to rendering the turbot agreeable to the table, which are simply these: Turbots, like many frail mortals of a higher grade, with all their good qualities, have been utterly ruined by falling into bad hands. Some we have seen half boiled, others half deluged in boiling water, which has been soused, fish and all, into the dish; some we have seen half-covered with scum, others boiled to rags, or, at least, cracked all to pieces; and once, but only once, we saw one actually make its appearance with the dark side uppermost! This has brought us to nearly the termination of this series of papers. It will be noticed that we have not given any diagrams of the tackle used for the capture of the fish named; but it was not our intention to omit them. They are very simple in their construction, but are difficult to convey their several parts without graphically appealing to the eye by the aid of the pencil. Having done this we purpose devoting a few columns of this journal to practical instructions for cooking fish. It is lamentable to think, with all the advance of knowledge—school boards and other adjuncts for the acquisition of knowledge—how doggedly the lower classes, and, indeed, the middle, adhere to the wasteful systems of their early ancestors. We take three familiar instances of waste going hand-in-hand with ignorance. In boiling a leg of mutton, all its valuable juices are lost, unless it is the purpose of the cook to utilise it for hashes, &c. Rashers of bacon are toasted now as they were two centuries ago, it being submitted to a process which robs it of three-fourths of its most valuable ingredients. In frying, again, for the want of the most simple knowledge of the chemistry of the frying-pan, the valuable

fish may either be rendered an object of absolute beauty to the eye of the colorist or disgust by its greasy, broken, and attempt-to-patch-up, condition.

CREEL.

EELS AND EEL CULTURE.

(*ANGUILLA ACUTIROSTIS.*)

(Continued from p. 29.)

FOOD OF EELS.

THE food of eels forms an interesting study. They are among the most voracious of carnivorous fishes. They eat most inland fishes except the gar-fish and the chub. Investigation of 600 stomachs by Oswego River fishermen showed that the latter bony fish never had a place on their bill of fare. They are particularly fond of game fishes, and show the delicate taste of a connoisseur in their selections from choice trout, bass, pickerel and shad. They fear not to attack any object when disposed, and their bite in human flesh shows even a vicious attitude toward man. On their hunting excursions they overturn huge and small stones alike, working for hours, if necessary, beneath which they find species of shrimp and crayfish, of which they are exceedingly fond. Of shrimps they devour vast numbers. Their noses are poked into every imaginable hole, in their search for food, to the terror of innumerable small fishes.

Eels are to the water what the fish-hawk is to the air. They are perhaps the most powerful and rapid of natatorians. Again, they hide in the mud beneath some log or overhanging rock and dart out with tremendous fury at the unsuspecting prey. They attack the spawn of other fishes open-mouthed, and are even said to suck the eggs from an impaled female. They fearlessly and rapidly dive head foremost in the mud, disappearing from view in the twinkling of a star. They are owl-like in their habits, committing many of their depredations at night.

EELS AS FOOD.

No fish is yet reported to utilise a grown eel as food. Pickerel, garfish and bass, which are particularly numerous in these lakes, are supposed to literally devour the young fry. Mr. Sawyer describes the operation of the pickerel darting through a long column of young eels, open-mouthed, and devouring vast numbers of them.

As a food for man the eel is a favourite to those who have tasted its meat smoked. Eels are shipped smoked, dressed and alive. Previous to being smoked they are salted for twenty-four hours, freshened and smoked over a cob fire from two to three. When dressed they are opened on the abdomen, skinned and shipped in powdered ice. When shipped alive they are packed in a barrel, with a chunk of ice, in which way they will keep twenty-four hours alive, and often longer.

NATURAL HISTORY NOTES.

Endurance.—The subject referred to last brings up an incident. On my return from Caughdenoy to Fulton, one of the hottest days in summer, I put an eight-pound female eel in a small air-tight wooden box. In this manner I kept it some five hours, carried it twenty miles on the cars, and put it in a large tub of water, where it lived thirty-six hours.

On this subject Frank Buckland writes in *Land and Water* :—

“The eel, as is well known, will live a long time out of water. This habit is of the greatest services to him, as sometimes it is necessary for him to migrate from place to place by an overland route. To enable him to live out of the water the eel has a most elaborate yet simple form of mechanism, by means of which he is enabled to keep his gills moist even though he is not in the water. It will be observed that immediately, or if not, very soon

after, an eel is taken out of the water two great swellings will take place on each side of the head, and if the eel is placed back in the water this swelling will immediately disappear. Let us now take a dead eel; we shall find close to the pectoral fin a slit in the skin which acts as a valve. If we take a probe and pass it through this slit we find that it enters a large cavity; next, take a pair of scissors and cut open this cavity; inside we shall find the gills proper. It is this cavity which the eel has the marvellous power of filling with water, and keeping a supply which shall not allow the gill fibres to adhere together, and thence of necessity stop respiration. This cavity is, of course, made of a large and loose skin-like membrane, which holds the required quantity of water; but in order to enable him to fill and empty this cavity, an elastic yet firm mechanism of some kind is absolutely necessary.

“See for yourself what a beautiful piece of machinery is provided by the Creator. A framework of very delicate bones, each bone connected with its neighbours by an elastic membrane of the consistency of gold-beater's skin, forms a fan-shaped covering over the gills; its action is very like, if not exactly the same as the action of an umbrella. When the eel wishes to take in his water supply he, as it were, opens the umbrella-shaped framework and fills his reservoir; when he wishes to expel the water he, as it were, closes his umbrella, as his reservoir is no longer required to come into action.

“If an eel be taken out of the water and laid on the floor of a room, and left there for some time, it will be seen that he will very soon expand his reservoir. After a time he will be desirous to refill his reservoir; take him up, and put his head into a basin; you will see that he will immediately take two or three great gulps so as to restock his breathing bags. It is by this beautiful piece of mechanism that the eel is enabled to live so much longer out of water than any other fish; and also, as I have stated before, to shift his quarters when it is desirable to do so.”

Mr. Hopkins, of Caughdenoy, told me that a dozen eels were kept in a crate anchored in the current for ten months without food. At the end of that time the box was let loose by a flood and is floating now, for aught I know. The incident illustrates the fact that fresh water is the staple food of the eel, particularly the female. The eels were boxed for the express purpose of experimenting on breeding. Unfortunately the largest specimens were selected for the experiment, which were of course entirely females. I believe that if both males and females were put in a large water crate, and arranged with soft mud and weeds on the bottom, they would breed at the proper time.

Tenacity.—When an eel gets into a slit in a weir, it squirms to get through. They are wedged in so tight sometimes that the fisherman simply cuts off and saves the part remaining above the slits.

The largest eel ever taken by the fishermen weighed twelve and one-half pounds, and was caught at Horseshoe Dam.

A large catch on any particular night in the Fall is regarded as foretelling a frost by fishermen.

The length of life in the eel is practically unknown.

In conclusion, permit me to say in behalf of the new persecuted fishermen of the Oswego River and the State of Delaware :

That I believe their fence dams are of great benefit to the State in holding back and retaining the water when it is low ;

That the eel is a terrible enemy of game fish, particularly bass and trout, and its extermination is advantageous to the protection of those fish ;

That the sportsmen of Northern New York who are endeavouring to pass laws to harass or break up the fisheries, are common enemies of a lawful industry, the interests of science, and the most enlightened views of this enlightened age.—*Chicago Field.*

THE CULTURE OF CARP AND CONSTRUCTION OF PONDS.

BY RUDLPH HESSEL.

PART III.—CONTINUED.

IN small ponds, situated in parks or gardens, which possess favourable soil and river-water, the increase of weight will be even a little greater if feeding is had recourse to, for such small ponds (covering only half an acre) cannot produce sufficient food themselves. On the whole, feeding is a makeshift, as will be seen presently, and which in very large ponds of more than from 20 to 1000 acres, should not be made use of.

The above calculations are only admissible for Central Europe, from the Adriatic to the Baltic and the North Sea; in countries further north, as in Sweden, the growth of the carp is less, as, on the contrary, in more southern countries than Central Europe, for instance in Illyria, Dalmatia, Southern Italy, Southern Spain, and partly, also, Southern France, the result is more favourable still. There a milder and warmer climate, an early spring, a very warm summer and autumn, and a late winter which, in addition, is mild and short, combine to exercise a favourable influence upon the thriving condition of the fishes.

In these warm climates the fish becomes lively at a much earlier season, if it does at all pass the winter in that lethargic state, without taking any food, than it does in the countries of the northern parts of Central Europe.

The pond-carp of Central Europe generally leaves its winter retreat, when the rays of the spring sun have warmed the water thoroughly, while at the same time it begins to seek for food at a somewhat earlier period in rivers and lakes. At the beginning of the month of March the eggs have developed themselves considerably in the body of the fish, and it only needs a few weeks of warm weather to bring about the spawning season. This commences in the middle of May in such lakes and ponds of Central and Northern France, Southern Germany and Austria, as have a warm situation and are sheltered from the cold winds. It continues in some localities throughout June and July, and sometimes in more elevated situations, until August, as, for instance, in Franconia and Upper Bavaria. The spawn of so late a season, however, is scarcely fit for breeding purposes, as the fish cannot grow much more during the short space of warm weather. It remains very small and suffers greatly from the ensuing winter weather, and is easily dwarfed at that time. The spawning of the individual fish does not take place all at once. Days and weeks may pass before it will have left the last egg to the care of nature. At times, upon the setting in of rainy, cool weather during this period, it will be interrupted, but re-assumed as soon as the temperature grows warmer again. Culturists altogether dislike cold weather at this time, as not only the eggs but the young fry also suffer much from it. Wet cold summers are no more profitable to the culturist of carp than to the agriculturist. In the southern part of Europe the spawning-season commences at an earlier date than in Central Europe. In Sicily, in the neighbourhood of Palermo, where there are some private ponds, the carp begins to spawn at the commencement of the month of April. This is said to be the case also in the French province of Constantine, Algeria, Africa.

The abundance of eggs in the carp is very great, and it is this circumstance which will explain its extraordinary increase in the natural waters. A fish weighing from 4 to 5 pounds contains, on an average, from 400,000 to 500,000 eggs. Other statements figure still higher. I not only made calculations myself, formerly, repeating them in 1876 on a female mirror-carp which I obtained from the environs of Gunzenhausen, Bavaria, and which, curiously enough, at the end of November was entirely ripe; but I also ob-

tained statements from culturists on whom I could depend. The calculation I made in the following manner: After freeing the eggs from all the fat and the enclosing membrane, and after having washed them in alcohol, I counted off exactly a thousand of them; these I weighed, and according to the result I deduced the number of the whole. In the somewhat longer-bodied scale-carp I generally found comparatively more eggs than in a mirror or leather carp, though all were of equal age and weight.

During the spawning season an appreciable change takes place in the male, protuberances, like warts, appearing on the skin of the head and back, and disappearing upon the expiration of that period. This is a peculiarity with most of the cyprinoids. Some time before the spawning season sets in the falling out of the pharyngeal teeth takes place; these grow anew every year.

Some days before spawning the fishes show an increased vivacity; they rise more often from the depths below to the surface. Two or three or more of the male fish keep near the female; the latter swims more swiftly on a warm, sunny morning, keeping mostly close to the surface, followed by the males. This is called "*streiben*"—running-spawning—and is more frequent in warm than in windy and rainy weather. The female prefers spots which are overgrown with grasses and other kinds of aquatic plants, such as *Utricularia*, *Nymphaea* and *Alisma*. The male fishes follow close to the very water's edge, as far as the diminished depth will allow them. They lose all their timidity and precaution, so that they may be taken quite easily. They lash the water in a lively way, twisting the posterior portion of the body energetically, and shooting through the water near its surface with short, tremulous movements of the fins. They do so in groups of two or three males to one female fish, and forming an almost compact mass. This is the moment when the female drops the eggs, which immediately are impregnated by the milt. As this process is repeated several times, the female drops probably only from 400 to 500 eggs at a time, in order to gain resting time, so that it will require days and weeks before it has given up the last egg.

The eggs of the carp are adhesive, not detached, like those of the *Salmonidae*, these latter lying loosely on the ground, while the former adhere in lumps to the object upon which they have fallen. As soon as the egg has left the body of the fish it swells up a little, the mucus, which surrounds it, serving as a means to fasten itself upon some aquatic plant, stone or brushwood. Those eggs which have no such object to cling to, are lost. I found numerous eggs on the reverse sides of the leaves of the *Nymphaea* and their stems, the *Phellodryum* and *Utricularia*, but the greater number of them I discovered on the *Fistula fluitans* which among the fishermen is known generally by the name of "water grass." Its narrow, long, strip-shaped, thin leaves spread softly over the water's surface, as also its numerous branches in the water afford to the fish the sought-for opportunity to deposit its eggs upon its tender leaves. The seeds of this grass are an excellent food for the carp. This may be regarded as a useful indication so be acted upon in the construction of ponds.

The eggs will develop themselves quickly, if assisted by warm weather. As early as the fifth or sixth day the first traces of dusky spots, the eyes, will be visible, and toward the twelfth, or at the latest the sixteenth day, the little embryo fish will break through its envelope. This rapid development takes place only in shallow, thoroughly-warmed ponds, or in such as were expressly constructed for hatching, and called breeding ponds. If these ponds are deep, consequently their water is colder, the hatching process may require as many as twenty days. In from three to five days the young fish has absorbed the yolks, and seeks its food. If the breeding pond be productive to furnish the

necessary food for so many young fishes, these will grow very rapidly. I shall return to this subject hereafter.

I remarked above that the carp prefers stagnant or slowly running water with a muddy bottom, and that it lives upon vegetable as well as animal food, aquatic plants, seeds, worms, and larvæ of water insects; it is therefore no fish of prey. It does not attack other fishes, and has no teeth in its mouth, but only in the throat, and is, on account of its harmlessness, an excellent fish for the culturist, as well as for stocking large lakes and rivers in general.

MY EARLY ANGLING DAYS.

MY first experience in trying to catch fish dates from a very early period—during my schoolboy days—for I have now passed my threescore years, and I look back to many pleasurable moments in my youth, when I have been engaged with my companions in angling for sticklebacks and stoneloach—for that was the only kind of fishing within reach in the neighbourhood where I then resided. The time is quite fresh in my recollection, as well as the various little streams where the amusement was practised. My appliances for fishing were of very rude material; the rod was my own manufacture, made out of a hedge-row stick, and the line of ordinary cotton; the hook generally consisted of a bent pin baited with paste, and sometimes with worms. The little fish were generally plentiful, and I seldom returned without affording some evidence of sport. When I got home the youngsters were put into a pudding basin, as aquariums in those days were uncommon. Gradually my stock became exhausted, as there was seldom a morning without finding several deaths; but as the half-holidays of Wednesdays and Saturdays came round, the afternoon was devoted to fishing, and each occasion if it did not increase the quantity it supplied the place of those that had ceased to exist. These juvenile fishing excursions were, without doubt, the formation of my first ideas of angling, and I refer to them with no small feelings of satisfaction in these later days, as having been the early promoters of my present position—although a small one—in the piscatorial world. I find my own family at the present time pursuing the same course, and in pleasant weather rambling after the same tribe of sticklebacks and stoneloach, and the scullery is made a receptacle of large fruit bottles, tenanted with the small fish. There is the same tale, most days, of death amongst them, or the naughty cat has been pulling them out with her claws. It is pleasant as I walk through the country lanes to witness the real enjoyment of the youngsters catching the little fish, and, then looking far beyond that period into the distant future when they will doubtless become greater anglers amongst the larger species. My first advance above the stickleback tribe was amongst the perch, and from that day perch-fishing has been my greatest delight. One of my scaley mates was related to the coroner, who lived in a nice house, and on the grounds there was a fish-pond that contained a large quantity of perch. We had permission to go there when we liked, and I well remember my first visit. By this time I had cast on one side the rude little stick and cotton line, and become possessor of an actual rod of three joints—not an expensive one, by the way, but it was a real fishing-rod, made of hazel, of the value of eighteen-pence, and I had line and hooks to match. On this first visit I happened to get into a good swim, and nearly every time I had a bite. The sport was exciting as the fish one by one came on the grass, to the envy of the others who were doing very little. It was a moment of importance to me—it was the great stepping-stone to my future in angling, and most anglers date back to a similar period, which settled their determination to become piscators. My brother, who was then with me, never had such a day and never became an angler; his taste got pushed on to other sources,

and if he is not an angler now there is not—though I say it—a better business man in the world. From that evening's sport, to which I have just referred, my taste for angling became a fact, and when I could not get any other place to practise it, I used to visit the warm water ponds at the various mills, which were full of gold and silver fish, putting back again the greater, if not at times the entire, portion, as they were useless for eating purposes, and only for globes as ornaments. I had now, as a matter of course, given up sticklebacks and stoneloach, and gradually found out places where I could get permission to fish for jack, perch, roach, dace, &c., a journey of 10, 12, and 15 miles being no consideration if angling was to be got. Of course, I was not always successful in getting fish, but the determination to go on never ceased; my evening's perch-fishing, as I have remarked before, was my first impression, and the remembrance of it has never left me. At this time I lived in Staffordshire, but at the age of 30 I came to reside in the suburbs of London, on the banks of old Father Thames. The days of sticklebacks, stoneloach, and gold-fish were entirely over but not forgotten, and now lay before me the beautiful River of Thames for my future sport. Thirty years ago the papers gave no weekly reports of Thames fishing as they do now; and as a fishery it was only great to the comparatively few who at that time fished in it, and not as it is to the multitude now. I had to get new rods and lines, and under the direction of one of our best of Thames anglers—who has long gone to rest—I had a couple of rods made on purpose for me, by Messrs. G. Little and Co., of Fetter Lane, both of which are as good now as they were on the day I first had them. It will thus be seen that the juvenile anglers are not to be despised—if they fish in the little rivulets and streams for such apparently useless things as sticklebacks, which at that time affords them innocent enjoyment. It may be, as it was to me, to make them future anglers in our lakes, canals, and rivers; and I for one would gladly encourage the youngsters in such amusement, as leading them forward in the right way to angle for fish worth catching. In making them good anglers they will become good citizens; for it is safe to affirm that piscators, as a rule, are of a genial and kindly disposed class of beings, following out the golden rules of fishing—patience and perseverance!

B.

ANGLERS should always be provided with something to take away the swelling and poisonous effect of the bites of insects. They should also have with them something to apply to a cut or sprain. Pond's Extract reduces the swelling and inflammation, stops bleeding and pain, and hastens the healing process in case of any wound or sprain; and it has no equal for application to the bites and stings of insects. Therefore never go on a fishing excursion unprovided with a bottle of Pond's Extract. It is for sale at all chemists, at 2s. 3d., 4s. 6d., and 8s. 6d. per bottle.—[ADVERTISEMENT.]

Tired Hands and Arms.—Edson's Electric Armlets and Wrist Bands. Invaluable for anglers and gun sportsmen and highly recommended for all persons having tiresome writing, sewing, or music practice. They give wonderful energy and strength, enabling the wearer to accomplish tedious work with steadiness and comfort. Price 2s. 6d. per pair, silk web and fine steel clasps. Sent to any address on receipt of P.O.O. payable to J. Edson, the Electric Fabric Co. Patentees, No. 1, Charlotte Street, Bedford Square, London W.C.—[ADVT.]

GREGORY'S SPINNING BAITS.—"The Gregory," the "Flexible Cleopatra," the "Oxford," and the "Colorado," pronounced by all Anglers and the Press the best baits invented for salmon, trout, pike, and perch. To be obtained from all respectable fishing-tackle shops in the world, and wholesale from Messrs. S. Allcock and Co., Standard Works, Redditch. Flattering testimonials speaking of the efficiency of the baits have been received from the Right Hon. John Bright, M.P.; Mr. William Bailey, Nottingham; the Rev. E. C. Holt, Teddington; Sir William Calder, Kingston-on-Thames, &c. Gregory's registered Archimedean spinning tackle for pike and trout, now ready, is pronounced by the press the best ever invented. For use with dead bait. The tackle is complete in every respect, and can be adjusted to suit bait of any size. Has been tried with remarkable success.—See that the name "Gregory" is impressed on the Archimedean fins, as inferior imitations are offered for sale, and people are thereby disappointed and deceived. Address, James Gregory, Vyse-street, Birmingham.—[ADVT.]

TO ANGLERS.—W. J. Cummins, Fishing Tackle Maker, Bishop Auckland, is now prepared to forward to anglers his Illustrated Catalogue, which is not only a Trade List but is interspersed with practical hints, useful directions, and valuable information gathered by the river-side from twenty years' experience. The stock consists of his unrivalled Salmon, Trout, Grayling, and Pike Rods, Lines, Reels, Baskets, Artificial Baits, Fly-books, Landing Nets, Gaffs, and last, but not least, his celebrated Trout Flies, which for killing powers stand unequalled. Every article kept in stock is of the very best description.—[ADVT.]

GEORGE JAMES EATON, of Starkholmes Matlock-Bath, Derbyshire, respectfully invites Noblemen and Gentlemen to try his standard FLIES for the present season. No flies sent or made up but what he himself has proved sure killers. A trial is all that is required from gentlemen who can fish to prove whether they may be genuine or not. Patronised by some of the best fishermen of the day. All flies dressed on the best Kendal hooks. Prices; Point Flies, 2s. 6d. per Dozen; Dropper Flies, 2s. per Dozen. Orders punctually attended to.—[ADVT.]

RIVER REPORTS

Thames (Richmond).

Prospects very bad, some 3 feet of snow on the land here, while the river is full of ice and snow. On Tuesday the snow fell from early morning till yesterday (Wednesday) afternoon.—JOHN BUSHNELL, fisherman.

Thames (Twickenham).

The river is now in splendid condition (not for angling) for skating, and some thousands of persons have crossed the river on the ice. The oldest inhabitant does not remember the river closing up with ice in so short a time; it was only last Saturday we had a rowing match round the celebrated Eel Pie Island with Daddy Wotten, manager of the Island Hotel, and Joe Sadler, ex-champion. If the frost continues we intend having a skating tournament by torch light.—ALFRED PERRIN.

Exe and Canal (Exeter).

Since my last we have had a most wintry appearance outside. Several inches of snow and freezing cruelly hard, and although the sun has shone brilliantly every day, not a shadow of a thaw have we had. But this morning (Monday, 17th) between six and seven o'clock, we had a heavy fall of snow, with every likelihood of more to follow, thus further putting a stopper to angling operations in the canal and many parts of the river. In the former the ice-boat, drawn by four, and sometimes more horses, has been in daily use, but if this frost continues a stopper will be put on that. The thermometer has registered, when fully exposed, as low as 26 degrees below freezing point. Mr. Carter's return shows that we had, on Saturday, the 15th, 20 degrees of frost in the day, and the thermometer has not shown such low readings since 1861. The tench ponds at Exminster, as also all other ponds, are thickly frozen, and are well patronised by the skating fraternity. The river, both up and down from the bridge, is also in good condition. Many hundreds are now skating and sliding on the lower side especially, the upper side being rather rough. Most of the wildfowl have gone farther westward, although many have fallen rather heavily in their flight across the marshes. Curlews, whimbree, herons, lapwings, golden plover, oyster catchers, sanderling, and fieldfares are very plentiful, and, with the exception of plovers, seem to stop with us, they only alighting for a short time then pursue their course westward. Previous to the frost some splendid fresh run salmon were seen upwards, and the Topsham fishermen have reported to me that they have seen them there, and they expect a good season on that account. Herrings are as plentiful as ever at Exmouth, also sprats; other kinds scarce. There has been a slight thaw this afternoon, and the wind shifted from N. to S.S.W., but at no time has the glass stood above 2 degrees above freezing. It is now (7 p.m.) 3 degrees below, the clouds very heavy and low down. Expect much snow before morning.—FRANK GOSDEN, Exeter.

Lee (Co. Cork).

A meeting of the Fishery Conservators of the River Lee was held on last Thursday, and it was announced that prompt and vigorous measures would be taken to check poaching. The announcement was not made a bit too soon if the reputation of the Lee as a salmon river was to be maintained. The proceedings were interesting in many respects, and were marked by what may be called a new departure in our river preservation. A deputation of the draft-net fishermen of Blackrock and Cork waited upon the Board and promised to aid their efforts in putting down poaching. As an earnest of their sincerity they undertook to give pecuniary aid, and to form themselves into a sort of vigilance committee. If this engagement is honourably carried out on the part of the net-fishermen we may look for some effectual remedy to the present evil of illegal fishing. On the part of the proprietors they have promised to subscribe a certain annual sum which has been fixed by assessment on their fisheries, to supplement the manifestly insufficient means which the ordinary resources of the Fishery Conservators supply. The assessment varies from £5 to £20, according to the value of each fishery, and will aggregate something like £200 a year. If this money is regularly paid it will enable the conservators to grapple to a very large extent with poaching, especially when aided by the volunteer forces referred to above. The meeting decided to purchase a steam-barge and to employ an efficient staff of bailiffs. It needs but the faithful and prompt execution of these plans, to insure a great improvement in angling during the approaching season. The spring fish are now commencing to run, and the stocking of the river must depend upon how far protection is afforded during the next month. It is a gratifying fact to find the net fishermen, who are themselves regarded as the most formidable violators of the law, coming forward and proposing to assist the Conservators. These men have learned by experience that their own interests are best served by protecting the breeding fish, and that the better and closer the protection the more abundant will be the harvest which the fishermen will reap at the proper season.—ANGLER.

Trent (Newark).

Since sending my last note, we have had weather of more than usual severity, and angling has been, in consequence, at a complete standstill, for I have not heard of a rod being out. In fact, I shrewdly suspect that if some angler of more than ordinary courage had been seen this week on the banks with a fishing-rod, he would have been deemed a fit candidate for the nearest lunatic asylum for the weather has been, without intermission, very sharp; to say nothing of the icebergs that have been constantly floating down the river. Tonight (Thursday) the weather still continues the even tenour of its ways; so I

can form no opinion as to when the angler may recommence operations, but he must content himself, like some of our Newark anglers, with a bit of skating. According to the account of your correspondent, Thomas Davis, Kingswood, the Avon, between Keynsham and Saltford must be a regular chub Paradise; but if he will communicate with me through the editor, I shall be happy to put him in the way of catching some of those chub with pith and brains, and also send him a tackle, with hook, &c., complete, as a sample. The Editor of this paper will give him my address.—THE TRENT OTTER.

Trent (Nottingham).

The weather during the last few days has been so severe that the Trent in the neighbourhood of Nottingham is completely blocked up with ice, and all the backwater is covered with a thick coating of ice, so that a good number of the anglers have laid their rods aside and taken to skating over the very spots they should now be angling for pike. The weather still continues to be very sharp, and I cannot see any chance of sport for some days to come, besides we have several inches of snow on the ground which, if it should go away quickly, will doubtless cause another flood. The prospects altogether at present are very much against the rodster. A good number of eels have been caught by breaking holes in the ice in places where eels are known to resort during the winter months. A spear was then used to fetch them out of the mud; though some believe the fish will come to such broken spots for air, of which I must say I have but little experience. There is nothing further to report about in the way of angling, and doubtless you will receive similar accounts from other rivers.—W. BAILEY.

Wye and Derwent (Derbyshire).

We have had some very severe weather in Derbyshire since my last report—a very great quantity of snow having fallen, which causes all our anglers to turn from the rod to the gun and skating, as all the ponds and backwaters are now frozen up; and the weather being bitterly cold makes it very enjoyable to the skaters. A very great quantity of geese and ducks have been flying over Derbyshire for the past week—some of the geese in large flocks. We shall have no angling while this weather continues, although both rivers are in first-class condition for fly and bottom fishing.—G. J. EATON.

The Yore (Yorkshire).

It is almost needless to inform my readers that angling was at a complete standstill in the Yorkshire district, the rivers being frozen over and the cold intense, and even when that abates, the heavy floods that will ensue will for some time preclude all possibility of angling. I daresay that most of your readers will have seen Mr. Francis's letter in the *Field* of last Saturday, extolling some most extraordinary gut which he had seen at the shop of Mr. R. Ramsbottom. As it appeared to be what I have vainly sought after for years, I immediately wrote for a supply, and was the fortunate recipient of a hank by return of post. I use the word "fortunate" advisedly, as Mr. Ramsbottom wrote me to the effect that even then he had twice as many orders as he could supply; Mr. R. also sent me one of his trade price lists, in which he quotes every possible requisite for the angler at very reasonable prices, and as regards quality, all I can say is, that if his other wares bear favourable comparison with the gut that I have received from him, they must fall very short of perfection, as it (the gut) is the most unique sample that I ever saw, and fully merits every word of praise which Mr. Francis Francis bestowed upon it, and I trust that during the coming season, it will be answerable for some heavy dishes of trout and grayling.—F. M. WILBRAN.

CLUB REPORTS.

ALEXANDRA SOCIETY OF ANGLERS.

Several members were out on Sunday, but our tray was empty at night. The prize will be put off for a week or two for some better weather.—C. HARTLAND.

HAMMERSMITH UNITED.

On the 16th several of our members were out despite the severe weather, but only one succeeded in taking fish, viz., Mr. Hobden, who weighed-in chub from Bourne End. If the present weather continues I am afraid our reports will become scarce.—VORTEX.

SOUTH SEA WHALING.—Whaling in the Southern Ocean has been on the decline for many years past, and, though the fishery is still kept up, the number of vessels engaged in it is annually decreasing. Tasmania is the principal colony which still clings to the old industry, and Hobart Town—or Hobart, as the capital was to be designated from the commencement of the current year—is the head-quarters of the fleet. This consists, however, of but a dozen small barques, and their returns have been so unremunerative during the past decade that it would appear probable that the fishery will soon be altogether abandoned. Lord Howe's Island used in old days to be a favourite place of call for whalers anxious to obtain fresh vegetables, but the inhabitants now contemplate deserting their solitary paradise in consequence of there being no market for their produce. It is possible, however, that the fishery may be looked upon as not altogether a hopeless investment of capital, in consequence a great capture of whales at Swansea, on the east coast of Tasmania, three months ago. The inhabitants, having seen a large school of whales embayed in shallow water, manned boats, and succeeded in killing or driving ashore no less than 86 fine fin-backs, the smallest of which measured from 25 to 30 feet in length. The entire beach at Swansea was covered with the huge carcasses, giving the appearance of a stranded fleet of dismasted coasting vessels, and there was quite an exodus from the capital to view so strange and unwonted a sight. In Orkney and Shetland such scenes are not unfrequent, and Sir Walter Scott has graphically depicted a whale *battue* in "The Pirate"; but no Tasmanians have ever before witnessed so great a slaughter of the monsters of the deep.—*The Colonies*.

A CHECKMATE TO RATS AND MICE.—The seeds and other valuables are suspended on a rope or wire, and a few round discs loosely fitted are added. When the performer attempts to get over one of these its spins round and throws him over. The bottoms of old preserve tins pierced in the centre answer well to supply discs but discs of stiff cardboard from old boxes answer just as well.—*The Garden Oracle*, Edited by Shirley Hibberd.

NOTES ON THE NATURAL HISTORY OF FRESH-WATER FISHES.

BY J. HARRINGTON KEENE.

THE CARPS—(continued).

IT is said by some that carp are occasionally hermaphrodite, but this I confess I cannot satisfactorily vouch for. I have certainly seen rudimentary organs of both sexes in one fish, but I do not think there is sufficient ground for believing carp can at any time produce both ova and the milt. Oftentimes I have found on examining an old and large fish that its deformity of the ovum would prevent it secreting and shedding any ova at all. This has been caused by the earlier secretions of ova becoming consolidated from a cause which I put down to be an internal parasite in the shape of tapeworm (*ligula digramma*), an immature cestode which largely infests carp and its *confreres*. The ovarum, in such cases of retention as have come under my observation, has positively been so hard as to resist the knife like a piece of beef, and its section has shown the form and substance of healthy eggs, hardened either by desiccation or pressure. Such fish oftentimes have two and even three lots of such ova in the abdomen in consecutive position, and are of aldermanic proportions; indeed, the ovarum and its contents, on one occasion, weighed a third more than the rest of the fish itself.

When healthy, the fish occasionally errs in an opposite direction, *i.e.*, it spawns twice in the year. Aristotle said the carp produce spawn five or six times a year, according to the stars—of course that statement is all moonshine and has nothing star-like about it; however, I am convinced that in warm situations the fish will deposit its eggs twice during the season, first in May and then in August. Whether the latter deposition comes to life or not is debateable. I should think not unless artificially cared for.

The number of eggs produced is really prodigious. A carp of 9lb. has been found to contain 621,000 eggs. These are of a greenish hue and about the size of a fig-seed. The gambols and excitement of carp during the season of generation are intensely amusing. I have seen the fish dance out of the water five feet or so, and like a salmon they will even “go for” an obstacle at this period. It is said that a hybrid between carp and bream is found in Holland, and a frequent hybrid between carp and roach in Prussia. With what degree of physiological truth this statement has been made I cannot here say.

Eel, like the carp, during the coldest weather, seeks the deepest and muddiest parts, and burrowing, if possible, beneath the surface either strictly hibernates or remains torpid till warm weather again arouses its vitality. Its power of sustaining without loss of life excessive cold is really marvellous. Sir John Franklin (first voyage) said that when after being frozen, their stomachs were struck out by a hatchet, on being gradually thawed, animation returned. Sir John Hunter, however, after some elaborate experiments on the eel—which I shall refer to when reverting to that animal—demonstrated that fish could not sustain a temperature below 30 deg. Fah. I shall criticise the conditions of the celebrated surgeon's experiments when the time arrives; at present I can only say that my experience bears out the truth of Sir John Franklin's statement. I have resuscitated perch after they have laid frozen for 36 hours—frozen so hard, indeed, that I could have broken them. Professor Owen has explained the endurance of the carp in a somewhat abstruse manner, by saying that it results from the “formation of the vagal lobes of the *medulla oblongata*.” What peculiarity is here exhibited, I do not know.

Possibly this peculiarity enables the carp to live out of water or in mud. They have been found in situations so strange as to warrant the supposition. So Willoughby thinks of spontaneous

generation. Of course this idea is untenable. Buffon states that they were fattened out of water at Anhalt Dessau, where they were fed on bread steeped in brandy. In any case considerable revenues are levied annually within the precincts of the German Empire from the culture of these fish.

Referring to the culture of this fish in the usual manner, it may not be amiss if I here give an outline of the procedure. The usual way in Prussia, is to drain the pond every seven years and sow the bottom of it with rye-grass or some such green stuff. The rich black mud favours the growth of the seeds to an amazing extent and after the grass has been allowed to exhaust itself—several consecutive cuttings being made before this occurs—the digging out of the soil is a comparatively easy matter. After this is accomplished, common hayseeds are sown and allowed to appear in a good strong plant. The water is then let in and the pond restocked with strong young carp. The grass is especially beneficial to the stock fish, and a few years show a capital pond of fat marketable carp.

For the purpose of accelerating the growth and improving the size of carp, a method of castrating carp—a sort of caponising process—was shown Sir Hans Sloane by a Mr. Tull. Sir Hans subsequently showed it to George IV., and gave a full description to Mr. Geoffrey of the Paris Academy of Science. It appears from this that the ovary leads out of the part termed the cloaca, and the experiments consists in severing its ligamentary muscles and the membrane, and after closing the wounds by means of a silk thread. The fish is afterwards returned to the water and the result is said to be an increase of voraciousness and a decidedly superior flavour when brought to the table.

(To be continued.)

THE BROADS AND RIVERS OF NORFOLK AND SUFFOLK.

PART II.—CONTINUED.

IT may well be imagined that yachting and boat-sailing is a favourite amusement on these waters. The pleasure-craft in general use is a boat of from 6 to 10 tons, with a roomy cabin, in which two or three persons can sleep comfortably, and with a fore-castle which will accommodate one or two men. A two or three weeks' cruise in one of these boats is a most pleasant way of spending a holiday, and one very often resorted to. There are always plenty of yachts to be had on hire at a moderate sum per week, and we can most strongly recommend this mode of seeing the Broads. Indeed, it is the only way of doing them thoroughly, as it would not do to depend upon inn accommodation and a boat at many of these out-of-the-way spots. There are two flourishing yacht clubs; and there regattas, at short intervals, make one or other of the Broads or river-reaches gay with white sails and many-coloured flags. The usual rig of these yachts is the sloop, consisting of a mainsail and large jib; and they are uncommonly handy. Formerly, the fashionable rig was the lateen, and many of these old craft are still in existence. The great wing-shaped foresail is picturesque, but the immense yard is awkward to handle, and the rig has gone out of fashion.

The marshes often present a curious sight. If the spectator is on the same level scarcely any water may be visible, and the expanse of marsh may seem continuous; yet here and there and everywhere are the sails of yachts and wherries gliding through it, their hulls invisible.

One constantly sees, generally moored in some creek, a large rough boat with a hut built upon it. These are the abodes of men who live by catching eels and other fish, and spend all the year round on the water. The lives of these men are much the

same as those of the "Broad-men," described by Mr. Lubbock.

"When I first visited the Broads, I found here and there an occupant 'squatted down,' as the Americans would call it, on the verge of a pool, who relied almost entirely on shooting and fishing for the support of his family, and lived in a truly primitive manner. I particularly remember one hero of this description. 'Our Broad,' as he always called the extensive pool by which his cottage stood, was his microcosm, his world—the islands in it were his gardens of the Hesperides, its opposite extremity his *ultima Thule*. Wherever his thoughts wandered, they could not get beyond the circle of his beloved lake; indeed, I never knew them aberrant but once, when he informed me, with a doubting air, that he had sent his wife and his two eldest children to a fair, at a country village two miles off, that their ideas might expand by travel: as he sagely observed, they had never been away from 'our Broad.' I went into his house at the dinner-hour and found the whole party going to fall to, most thankfully, upon a roasted herring-gull, killed, of course, on 'our Broad.' His life presented no vicissitudes but an alternation of marsh employment. In winter, after his day's reed-cutting, he might be found posted at nightfall waiting for the flight of fowl, or paddling after them on the open water. With the first warm days of February he launched his fleet of trimmers; pike finding a ready sale at his own door to those who bought them to sell again in the Norwich market. As soon as the pike had spawned and were out of season, the eels began to occupy his attention, and lapwings' eggs to be diligently sought for.

"In the end of April the island in his watery domain was frequently visited for the sake of shooting the ruffs which resorted thither on their first arrival. As the days grew longer and hotter, he might be found searching in some smaller pools near his house for the shoals of tench as they commenced spawning. Yet a little longer he began marsh-mowing—his gun always laid ready upon his coat, in case flappers should be met with. By the middle of August teal came to a wet corner near his cottage, snipes began to arrive, and he was often called up to exercise his vocal powers on the curlews that passed to and fro. By the end of September good snipe-shooting was generally to be met with in his neighbourhood; and his accurate knowledge of the marshes, his unassuming good humour and zeal in providing sport for those who employed him, made him very much sought after as a sporting guide by snipe-shots and fishermen: and his knowledge of the habits of different birds enabled him to give useful information to those who collected them."

The older men have many yarns to tell of the gigantic pike and eels, and great catches of their younger days, with sometimes a spice of adventure, as the following tale will show. The men from the Yare and the Waveney having well harried their own waters, used to go up the Bure, and their depredations with nets and set-lines stirred up the wrath of the men of the Bure. There was then no remedy save that of force, so the natives banded together to expel the intruders. Our informant and his mate were engaged one dark night near Ranworth in setting eel-lines, when they heard the sound of muffled oars up the stream. They listened and watched, and at last became aware that at least half-a-dozen boats were creeping down in search of them. They took to their oars, and then the chase developed itself into a hot and eager one; both parties pulling their lustiest, the one to inflict, and the other to escape rough punishment. The pursued were nearly caught, when they opened up a reach, down which there blew a fair strong wind, and hoisting their lug-sail they slipped away, and gained such a lead that the pursuers gave up the chase.

Notwithstanding that there is so much marsh the climate is not unhealthy. There is, owing to the improved drainage, a

constant though slight movement of the water everywhere, so that it does not form the foul stagnant puddles that it formerly did. There is always plenty of wind, and often a salt air from the sea, so that the marshes and lakes are well purified. At Somerleyton, near Lowestoft, there has been found an exceptional quantity of ozone. The matter may have been different when the puddles and pools in the marsh dried and festered, and the dead fish putrefied, causing bubbles of foul air to arise and sometimes ignite in a blue flickering flame. Many years ago Will-o'-the-wisp were common enough, and the wherry-men have even lit pieces of paper at the uncertain flame. The last time at which we have satisfactory evidence of a Will-o'-the-wisp being seen was twenty years ago. The marshes are sweet and pure enough now.

Mention has been made of reed-cutting. This is the "Fen folk's harvest," and one purpose to which the reeds are put is to be used instead of laths for the formation of ceilings and "lath and plaster" partitions.

Among the Broads the shooter and the angler will find abundant sport, the naturalist full occupation, the yacht sailor opportunities such as no other part of England presents, the artist colour and effect, and, lastly, there are subjects enough for the antiquarian to ponder over. Wherever one looks there are churches—there are 740 in the county. Three or four spires may be seen from every coign of vantage.

St. Benedict's Abbey, on the banks of the Bure, presents some interesting ruins. Burgh Castle at the head of Breydon Water is a spacious fort of Roman origin. The wall and towers on three sides of it are very perfect. The semi-Dutch town of Yarmouth, with its singular narrow streets, or "rows," is worth a day's peregrination. And Caister Castle, three and a half miles from Yarmouth, is a picturesque ruin.

In winter when the flooded marshes and the Broads are frozen, the skater will have ample elbow-room, and the naturalist and sportsman may penetrate into the very fastnesses of the wild-fowl."—*Blackwood*.

SPECIAL SEASONABLE ENTERTAINMENT TO THAMES RIVER-KEEPERS.

IT has been the custom for some years to give a seasonable dinner to the river-keepers employed in the protection and preservation of the Thames fishery below the "City stone" at Staines. The idea originated from the present secretary of the Thames Angling Preservation Society, and was at first limited to the bailiffs attached to it; afterwards the keepers of the Thames Conservancy were included, and, since the lock-keepers have had deputations given to them on the recommendation of the Committee of this society, it has received the still further addition, together with one or two fishermen, who have always been ready to assist the keepers when their services have been required. During the last year there has been great activity evidenced amongst the general body of keepers and several important convictions; therefore it was determined, for that and other reasons, to give the men a specially-arranged entertainment in London, instead of the customary gathering at one of the Thames-side houses, which only on this particular occasion will be deviated from. One other reason which, it is believed, prompted the secretary to suggest the present deviation, was his desire, on the termination of his twenty-one years' connection with the society, to see the men gathered around him over something extra to the usual gatherings. In response to a personal application for admission to the Westminster Aquarium at a reduced rate, Captain Hobson, the active and respected manager, most liberally and cheerfully granted the men free admission, supplementing his liberal policy with an offer to escort the men over the entire

building. The equestrian performances, under the talented management of Mr. Percy Williams, being one very great attraction, as of unusual excellence, a request was also made to the members of the Piscatorial Society for permission to let the men see their splendid fish museum in the club room at Ashley's Hotel, Covent Garden, which was readily acceded to. The closing portion of the programme was the most substantial feature in the proceedings, and that was to dine at the Holborn Restaurant—which has become so noted for its first-rate dinners and excellent management. A deputation, consisting of Mr. Thomas Spreckley, Mr. Alfred Jardine, and Mr. W. H. Brougham, waited upon Mr. T. J. Hamp, in reference to this part of the arrangement, who met them in the most liberal manner, and adopted a *menu* of soup, fish, joints, roast and boiled turkey, mince pies, plum puddings, cheese, and dessert, as being one of a suitable and substantial character. The gentlemen forming the deputation were very much pleased with Mr. Hamp's readiness to meet their wishes, and were satisfied he would do all that was possible to make the men happy and comfortable. In order to obtain a goodly gathering at the dinner, and to make it more attractive, it was arranged to admit the members of the committee and their friends to dine at the same tables with the men, but at their own cost, and who would doubtless contribute to the harmony of the evening. Invitations were then issued to the following river-keepers, assistants, and lock-keepers, setting forth the special arrangements made for the 18th of January, the day set apart for their seasonable entertainment:—Messrs. G. J. Rough (Wandsworth), J. Drewe (Kew), C. Brown, J. Smith, and E. Brown (Richmond), Henry Walters (Twickenham), J. Tame (Teddington), John Johnson, sen. (Kingston), W. Milbourne, Palmer Scott, and Daniel Philips (Moulsey), John Milbourne, Alfred Stroud, and Henry Joist (Sunbury), George Hove (Walton), Alfred Trodd (Halliford), David Hackett, Herbert Carr, and J. Newble (Shepperton), T. Watford (Chertsey), and Alfred Thompson (Staines). The head-keeper, Henry Walters, whose efficient services have been highly distinguished, acted as captain of the occasion. Mr. Thomas Spreckley kindly undertook to occupy the chair, and the following gentlemen arranged to become visitors at the interesting gathering:—Messrs. Alfred Jardine, T. W. Reilly, A. Benningfield, John Knechtli, George Watts, F. H. Lemann, Harrison, H. B. Lemann, W. H. Brougham, Richard Lord, B. Perelli-Rocco, C. P. Wheatstone, T. Plews, F. C. Hatfield, W. Brooks, T. Brooks, Alfred Nuthall, G. H. Thurston, J. Perrin, J. P. Wheeldon, P. Geen, F. C. Clench, W. D. Lewis, James Pattison, Thomas Huggett, &c. The day, unfortunately, as regards the weather, was of the most disagreeable character such as has been seldom experienced in London, but in spite of this unlooked-for drawback, there were only two or three of the men absent; and thanks to the good marshalling of Mr. F. C. Hatfield, after witnessing the performances at the Aquarium, they were taken, first of all, to his house, the Star and Garter Hotel, St. Martin's Lane, Charing Cross, and inspected the splendid collection of fish belonging to the Silver Trout Angling Society, and thence to Ashley's Hotel to see the Fish Museum of the Piscatorial Society, arriving at the Holborn Restaurant in time for dinner. Very great praise is due to Mr. Hatfield, as without his kind services, this portion of the arrangements would never have been carried out. There was a great expression of regret at the absence of Mr. Thomas Spreckley, who it was expected was blocked up at home with the snow; and his excellent partner in Cannon Street—Mr. Samuel White—kindly took the chair. There were comparatively few of the gentlemen absent who had arranged to come as visitors, and they must have come at great inconvenience with scarcely any idea how they would get home, as there were no cabs or conveyances, and the unwelcome report of

several lines of railway being blocked up. After full justice had been done to a very excellent dinner, which all thoroughly enjoyed, Mr. White proposed the toast of "The Queen and the rest of the Royal Family," and then Mr. Alfred Jardine gave "The Health of the River Keepers," which was replied to by John Milbourne, of the Thames Conservancy, and Henry Walters, of the Thames Angling Preservation Society. The next toast, which was given by Mr. S. White, was "The Chairman (Mr. T. Spreckley) and the Secretary (Mr. W. H. Brougham)," which was responded to by the latter. Mr. Brougham gave "The Health of Mr. S. White," and the only other toast was "The Press," proposed by Mr. Alfred Jardine and replied to by Mr. J. P. Wheeldon. The remainder of the evening was devoted to harmony, but it was brought to a much earlier termination in consequence of the anxiety of getting home, under the difficult circumstances before mentioned. Had the weather been at all favourable, the occasion, as regards the enjoyment of the entertainment, would have been one of pleasurable recollection, and as it is it will not be forgotten from the severity and difficulties encountered in a heavy blinding snowstorm.

MERCILESS FISHING.

MANY of your readers will, I am sure, agree with much that is said in the article headed, "Merciless Fishing," in your last issue; but it appears to me there are other considerations besides those so ably referred to by your experienced correspondent. I would, therefore, in the first place, ask your readers to reflect a little and to consider for what purpose angling societies are established. They are, I believe, established for the meeting together of anglers, and in most cases for giving prizes for the best show or shows of fish caught on certain days; prizes for specimen fish; and, in some cases, prizes for the greatest weight of fish caught during the season. Such being the case, members are desirous of doing what they can to secure such prizes; nor, from my point of view, do I see aught but honour to them if they are successful in so doing; always provided their club rules do not allow them to show or weigh-in undersized fish, which certainly is the case if anglers weigh-in to the sizes fixed by the Thames Conservancy, there being a growing opinion amongst many Thames anglers that the sizes so fixed are much too small, especially with regard to pike and barbel. If, as suggested, specimen fish only are shown, half the pleasure of the weekly meetings would be removed; as, in the natural course of events, it would only be occasionally there would be fish upon the club tables. With such a state of things I feel convinced there would be a difficulty in getting your members together. The question between anglers would be: Shall I see you at the club to-night?—I don't know. Is there anything on?—No, nothing particular; and the member, feeling pretty confident no fish would be shown, would fail to attend. This would be carried on *ad infinitum*, ultimately ending in the breaking-up of the society. In the second place I consider it an especial honour for an angler to secure a large gross weight in competition on a certain day or days. In the Piscatorial Society, to which I have the privilege to belong, some of the pleasantest evenings we spend in the year are the evenings of our various competitions. During the past season we have had five, viz.:—Pike, barbel, chub, perch, and roach, and we are particular that the fish shown are none of the small fry referred to in "Merciless Fishing." No fish is eligible to be weighed-in for competition under the following sizes:—Pike, 3lb.; barbel, 2lb.; club, 1lb.; perch, $\frac{1}{2}$ lb.; roach, 6oz. If angling clubs would make their limit not less than the above weight, I do not think much harm would be done by gross-weight competitions, but one must entirely and emphatically agree with

your correspondent, that when the size of barbel are only 12 in. from eye to fork of tail, and I assume other fish in proportion, gross-weight competitions are most seriously to be deprecated and should be discountenanced by all angling societies, so far as the Thames fishing is concerned. I do not think the angler ought to be debarred by any club rules from occasionally having a heavy take. He is already heavily handicapped. What with the constant wash of the steam-launches, the dainty appetite of Thames' fish, and their thorough education, they will on most occasions be quite a match for the most experienced. In my opinion he deserves a day now and then which will cheer him on to further exertion. Referring to the remarks about private fishing, a good rule would be that all club prizes should be for fish caught in public waters. The angler would not then have the same motive for carrying a number of fish from private waters to his club, and would content himself with taking one or two or more specimen fish. In replying to your correspondent "B," it appeared to me there were other sides to the question. I have endeavoured, feebly I fear, to explain my views; some of your numerous readers will, perhaps, give theirs, on a subject which is open to many arguments. "B" deserves the warm thanks of all for calling attention to the matter, which is one well worthy of deep consideration. Raising the sizes of the fish allowed to be weighed-in at the clubs, appears to me to be the true remedy. It can easily be adopted by angling societies, without in any way giving offence to their members, and would tend most certainly to prevent what your correspondent so justly calls—"Merciless Fishing."

T. HUGGETT.

MANCHESTER ANGLERS' ASSOCIATION.

ANNUAL DINNER.

THE third annual dinner of the Manchester Anglers' Association was held on Tuesday evening, January 11th, at the Albion Hotel, Piccadilly, and was numerously attended. Colonel John I. Mawson, the President, was in the chair, and amongst other gentlemen present were the Mayor of Manchester (Alderman Baker), Alderman Heywood, Messrs. James Crossley, president of the Chetham Society; Edwin Waugh, the Lancashire poet; Professor Williamson, of Owens College; George Milner; Abel Heywood, jun., hon. sec. of the Association; Francis Francis, editor of the fishing department of the *Field*; J. H. Nodal, editor of the *Manchester City News*; E. De Jong, C. Estcourt, city analyst; the Revs. W. White and G. Sumner; Messrs. E. G. Simpson, T. Harker, G. Harker, Geo. S. Woolley, F. J. Faraday, Robert Burn, and Alfred G. Jardine, London. After the loyal toasts,

Mr. Francis Francis proposed "The Manchester Anglers' Association." He said the subject of angling was one which he had very much at heart, and he would yield to none in his love and veneration for the gentle art. (Hear, hear.) He began his angling experiences in Portsmouth, where he need hardly say the difficulties of pursuing such a recreation were not few. He should think the difficulties to Manchester were quite as great, however, but it was quite evident from the large assembly before him that angling was a delight to many people in this city. And it was well that this was the case, for it was a pursuit from which many benefits both moral and physical may be derived. (Hear, hear.) Whenever he felt wearied or sad he went out angling for a week or ten days, returning quite fresh and vigorous; and he believed it was due to this fact that he had outlived many of his London acquaintances, who, he was sorry to say, were not anglers. Putting it, therefore, upon no higher ground than that, angling was an art worth following. (Hear, hear.) But in addition to this, it had a refining influence, the effect of that silent communing with nature which accompanied the pursuit. It was also productive of good fellowship, there being a sort of brotherly feeling amongst anglers all the world over. (Hear, hear.) He was delighted to see that the Manchester anglers were treading in the footsteps of good old Izaak Walton, and he felt that the manner in which he (Mr. Francis) had been received by them was a compliment to the whole world of anglers. They were setting his London friends an example in more ways than one; that beautiful and artistically designed menu card, for instance, was something they were not yet equal to in London. Then there was the society's volume, some of the papers in which were extremely good, far beyond what might be expected from amateurs. It was pleasing to see that members of the association would take the trouble to keep such interesting records of their experience, for the information of brother anglers. It was the first time to his knowledge that any anglers' association had taken a step of this kind, and it was therefore all the more creditable to Manchester. He was glad to learn that the association was so prosperous, and would now ask them to drink to its success. (Applause.)

The President, in responding, said that twelve months since he had

the great delight of welcoming a number of brethren and visitors. It was a double pleasure to do so on the present occasion, because of the many additional faces he saw around their board, men whom at one time they could scarcely hope to see, but whose good wishes and assistance they had been striving to obtain, and at last they had got them. (Applause.) Time was when the association was looked upon as a dozen anglers who did not know what to do with themselves—(laughter)—and at their previous anniversary, instead of having the Mayor of Manchester amongst them, they had the Chief Constable, as if they were a lot of doubtful characters. (Renewed laughter.) They were all delighted to see his worship present, as they hoped it was some evidence of his willingness to assist them in restoring the streams of this district to something like their original purity. After referring in graceful terms to the presence of Mr. James Crossley, Mr. Waugh, and other representatives of literature and art, he expressed a hope that the monthly meetings of the association would be more numerous attended than hitherto, and concluded by thanking the assembly for the hearty manner in which they had received the toast.

The Rev. G. Sumner, in proposing "The Manchester Corporation," began by saying that he was about the last person in the world they should have selected for that duty, because he owed the Corporation a grudge. (Laughter.) He then gave a humorous description of the circumstances which gave rise to this grudge—viz., the seizure of his dog in August last, for being at large; his subsequent attendance before the Nuisance Committee with the intention of lecturing them on muzzling, and finding, to his dismay, that the word "muzzle" was never once mentioned in the official notice as to canine madness, and his ultimate punishment, of having to pay half-a-crown penalty. Speaking seriously, however, he was sure no eulogy of his was required to convince the citizens of Manchester that they have an excellent governing body. (Hear, hear.) As a body of anglers, they looked to that Corporation as the conservators of their local streams, and he would just like to describe to that meeting a vision of what he believed was possible. He saw in the future, the pleasures of angling being brought to their own doors by the purification of the Iwell, the Medlock, and the Irk. He saw Thirlmere the citizen's lake, as a centre of recreation for Manchester anglers—(hear, hear)—he saw the possibility of all these changes being brought about by the combined efforts of the Corporation and the Manchester Association of Anglers. (Applause.)

The Mayor responded. He said that as the association had the Chief Constable with them at the last annual dinner, and they had the Mayor this year, it might be fairly said they had "taken a rise" out of the Manchester Corporation. (Laughter and applause.) When he received the invitation, he determined at once to accept it, because it recalled his early years, when, as an angler, he used to enjoy the country, and the sparkling rivers which traversed it. (Hear, hear.) That habit he continued as long as he had leisure for it, and he did not hesitate to say that it brought him a great deal of out-door enjoyment, besides making him acquainted with many delightful books in the English language, first and foremost of which was that of dear old Izaak Walton, who, to his mind, was as immortal as Shakespeare. (Applause.) He (the Mayor) had also been a collector of books on angling, and although he had not now the opportunity of renewing his acquaintance with those volumes, he looked upon them as old and dear friends. (Hear, hear.) In one of these, written by a collateral descendant of Humphrey Chetham, the writer spoke of the Irk producing "fat and luscious eels." (Laughter.) He only wished he could live to see fat and luscious eels there again. (Hear, hear.) He had listened with delight to the pleasant dream which the proposer of the toast had indulged in, and he trusted that dream would some day be realised. If some means could be discovered of producing heat without smoke, then he believed our rivers might become once more habitable to fish, because, in his opinion, the present pollution of those streams was in a great measure due to the smoke which pervades this district. As for the sewage, that could be kept out of them, and with these two causes of pollution removed there would be some chance of Mr. Sumner's dream being fulfilled. (Hear, hear.) He sympathised with that gentleman in his troubles about his dog, but thought he made a great mistake when he went to talk to the Nuisance Committee, for it was like taking coals to Newcastle. (Laughter.) He had found out that those men are most prized in the Council who talk least, and that was the reason he had been made Mayor. (Laughter and applause.) In conclusion, he rejoiced at the success of the association, and hoped it would continue to prosper, as he had little doubt it would do, seeing the energy, intelligence, and enthusiasm by which its members were characterised. (Applause.)

Alderman Heywood being also invited to respond, said there were one or two questions now before the Corporation of great public importance, the proposed transfer of the Royal Institution to the City being one of them. If the public think that transfer would be a proper one, the public ought to speak out upon the subject. (Hear, hear.) Let there be no mistake. Don't let the Corporation suppose there is a degree of apathy amongst the people of Manchester in relation to that transfer, for if the present offer of that institution be not accepted they might not have a public art gallery or museum for many years. (Hear, hear.) Another question of great public interest and of special interest to this association was the cleansing of our rivers. But that was a work which could not be accomplished in a day or a year. He was sure, however, that the Manchester Corporation would not be wanting in their efforts to bring about so desirable a result. (Hear, hear.)

Mr. Davies having proposed "Our guests,"

Mr. James Crossley responded, and was enthusiastically received. He said he supposed he had been selected to discharge that duty because he was the oldest person in the company—a circumstance

which very nearly prevented his being present, for some of his friends had called upon him to protest against his going to the dinner on any account. They said to him, "Look at the number of dinners you have been to already. (Laughter.) This is a time when you might graciously give up all such enjoyments, for they are only

'Double, double,
Toil and trouble.'

He would not say what he had told those friends, but this he would say, that he had never found dinners of this sort to be

"Double, double,
Toil and trouble."

(Laughter.) He never went to a dinner of this sort without feeling better for it the day after, and feeling he had been doing his duty as a citizen. These annual dinners were great consolidators and harmonisers of society, and he doubted whether any society was legally and properly constituted whose members did not occasionally dine together. (Laughter and applause.) Another reason he had for going to these dinners was that he was a lover of the human face divine, and he never saw it under a more benignant or amiable aspect than on such occasions. (Laughter.) On behalf of the guests, he felt sure he might say that it had been a great pleasure to them to be present. He looked upon angling as a sort of mental school, whereby the character of those who pursue it is elevated as the result of the patience and perseverance required. He believed that when a man becomes an angler he becomes a better citizen, and whenever he was introduced to a stranger, if he was told he was an angler, his confidence to him was at once increased. (Hear, hear.) He had read the papers of this association with very great delight, and hoped the members would go on disseminating such information relating to the gentle craft. He also thought the purification of our streams was a very proper subject for the association to take up, and he sincerely hoped the good results in that direction would some day be seen. (Applause.)

Mr. Edwin Waugh and Professor Williamson also responded.

As usual at the gatherings of this club the singing was a feature of the evening, the pieces mostly having some reference to angling. Mr. David Reid sang with his customary vigour and effect the society's special ballad, written by Mr. G. Davies, with its triumphant tramping chorus—

"We'll all go a-fishing to-day,
When nature looks smiling and gay;
We'll leave the rude throng that goes jostling along,
And we'll all go a-fishing to-day;"

which was taken up with immense gusto by the members. Mr. Thomas Rawson sang, amidst frequent bursts of hilarity, a new and clever version of the "Three Jovial Huntsmen," which rumour accredited to the pen of the honorary secretary. The first verse of this runs:

"There were some jolly anglers, who a-fishing used to go,
And they fished with fly and minnow, and sometimes with worm also.

Look ye there!
Some went to fish for salmon, while others tried for trout,
And some there were who did not care whatever they got out.
Look ye there!"

Mr. H. Stevens presided at the piano. The menu card, referred to by Mr. Francis in his speech, was designed by Mr. W. G. Baxter. It represented Colonel Mawson, the president, in the character of Neptune, surrounded by the members of the Council of the Society in the guise of fishes and birds, the caricatured likenesses being in almost every instance easily recognisable. It is most cleverly done.

NATIONAL FISHERIES EXHIBITION.

TO BE HELD IN NORWICH, APRIL, 1881.

Special Prizes for the Best Models, Apparatus, Plans, Essays, Manufactures, &c., prepared by the Exhibitors.

- 1.—Plan or Model of the best Fish Culture Establishment. £25. E. Birkbeck, Esq., M.P. Horstead Hall, Norfolk.
- 2.—Fish Hatching Apparatus, full size, with Appliances and Implements. £5. The National Fisheries Exhibition.
- 3.—Model of Fish Pass. £10. The National Fisheries Exhibition.
- 4.—Essay on the Acclimatisation and Cross Breeding of Fish. £10. Thomas Mann, Esq., Thelton Hall, Norfolk.
- 5.—Essay on Pisciculture as a source of National Wealth. £20. T. J. Mann, Esq., Bournemouth.
- 6.—Model of a Fishing Trawler. £10. The National Fisheries Exhibition.
- 7.—Model of a Fishing Drifter. £10. The National Fisheries Exhibition.
- 8.—Apparatus and Gear complete for a Trawler. £10. The National Fisheries Exhibition.
- 9.—Apparatus and Gear complete for a Drifter. £10. The National Fisheries Exhibition.
- 10.—Collection of Nets used in Deep Sea Drift Fishing. £20. The National Fisheries Exhibition.
- 11.—An Improved Trawl Net, capable of allowing Immature Fish and Refuse to escape therefrom. £20. The Worshipful Company of Fishmongers of the City of London.
- 12.—Crab and Lobster Pot. £3. The National Fisheries Exhibition.
- 13.—Plan or Model of the best Fish Curing Establishment. £25. The Corporation of Great Yarmouth.
- 14.—Collection of Inland Fishing Tackle, comprising an Anglers' Outfit. £10. The National Fisheries Exhibition.
- 15.—Collection of Sea Fishing Tackle. £10. The National Fisheries Exhibition.
- 16.—Collection of Fishing Implements, Tackle, &c., used in the Norfolk and

Suffolk Waters. £10. The Yare Fish Preservation and Angling Society.

- 17.—Angling Associations, the best Code of Rules for their Management in a Sportsmanlike manner. A Salmon Rod with Winch, Fittings, and 12 doz. Salmon and Trout Flies. R. B. Marston, Esq., Editor of the FISHING GAZETTE.
- 18.—Model of a Boat suitable for General Fishing in the Norfolk and Suffolk Inland Waters. The models to be $\frac{1}{2}$ full size, and the price not to exceed £12 complete with all fittings. Each Exhibitor must guarantee to supply as many boats as may be ordered of him at the price he may name. £10. The Yare Preservation and Angling Society.
- 19.—Boat, full size, complete with all fittings, for offshore fishing in rough weather, requiring not more than four hands. The first consideration being stability in a surf—the second cost—the third weight. Each exhibitor must guarantee to supply as many boats as may be ordered of him at the price he may name. £25. Samuel Hoare, Esq., London.
- 20.—Dress for a Life-boat Crew. £10. Dr. Eade, Sheriff of Norwich.
- 21.—Plan for a Trap or Sluice for taking Eels, so as not to interfere with other Fish. £5. The National Fisheries Exhibition.
- 22.—Mode of Fishing for Shrimps, Sprats, and other Fish, such mode intended as a substitute for fixed Engines in the Estuaries of Rivers, and must satisfy the following conditions:—
(1) Its capacity for catching Fish to be equal to that of the fixed Engine.
(2) Its action not to be prejudicial to the Fisheries of the River. £10. The National Fisheries Exhibition.
- 23.—Essay on Oyster Breeding. £15. The Worshipful Company of Fishmongers of the City of London.
- 24.—Essay on the Utilisation of Localities generally suitable for the Cultivation of Oysters. £15. The Worshipful Company of Fishmongers of the City of London.
- 25.—Essay on the Utilisation of Localities in Norfolk and Suffolk suitable for the Cultivation of Mussels and other Shell Fish. £25. The Corporation of Great Yarmouth.
- 26.—Essay on the Artificial Propagation of Anadromous Fish other than the Salmon, and the Restocking the Tidal Waters of our large Rivers artificially with Smelts, &c. £10. The National Fisheries Exhibition.
- 27.—System of saving of life at Sea in the transport of Fish from the Fishing Vessel to the Carrier, Illustrated by Model. £25. Royal National Life Boat Association.
- 28.—Plan of Improved Fishermen's Dwelling. £15. The Right Hon. Lord Suffield.
- 29.—Model of Refrigerating Fish Van. £20. The Worshipful Company of Fishmongers of the City of London.
- 30.—Ditto, Fish Van, not Refrigerating, suitable for general use by road or rail, the cost not to exceed £75. £30. J. J. Colman, Esq., M.P.
- 31.—System of Signalling at Night for Fishing Fleets and Vessels. £10. The National Fisheries Exhibition.
- 32.—Process for the Utilisation of Condemned Fish and Fish Refuse as a Manure. £30. The Worshipful Company of Fishmongers of the City of London.
- 33.—Process for rendering Innocuous to Fish-life streams polluted by Sewage and Chemical or other works. £20. S. Grimmer, Esq., the Right Worshipful the Mayor of Norwich.
- 34.—Essay on the Salmon Disease, its Nature, Causes, and possible Remedies. £10. R. B. Marston, Esq., Editor of the FISHING GAZETTE.
- 35.—Essay on the Parasitic and other Diseases of Fish other than Salmon. £5. The General Prize Fund.
- 36.—Essay on the Principle upon which any Legislation on the Fisheries of the Country should be based, and is it desirable that Boards of Conservators should have the Management of all the Fisheries in the Country, with power to impose Licenses. £50, 1st prize. The Right Hon. The Baroness Burdett-Coutts. £25, 2nd prize. The National Fisheries Exhibition.
- 37.—Collection of Stuffed Fish caught in Norfolk and Suffolk. £5. A. J. N. Chamberlin, Esq., Wroxham.
- 38.—Specimens of Dried, Salted, Smoked, and Tinned Fish of all kinds. £10. Edmund Johnson, Esq., London.
- 39.—Collection of Inland Aquatic Flora and Fauna. £10. The National Fisheries Exhibition.
- 40.—Collection of Edible Shell Fish. £10. The National Fisheries Exhibition.
- 41.—A Light, Portable, Waterproof Package, to contain Set of Tackle for Inland Angling, with compartment for Luncheon, and suitable for carrying in the hand. £2. F. Sutton, Esq.
- 42.—Essay on the Migrations and Spawning of Sea Fish, especially Soles, Turbots, Plaice, and other Flat Fish. £20. The Worshipful Company of Fishmongers of the City of London.
- 43.—Essay, accompanied by Maps showing Localities where Mussel Beds can be established, and how existing Mussel Beds can be best cultivated and protected so as to afford an increased supply of Mussels as Bait for the Long Line Fisheries. £30. The Worshipful Company of Fishmongers of the City of London.
- 44.—Fishing Rod, Line, and Fittings complete, best suited for general use in the Norfolk and Suffolk Inland Waters. £2. J. L. Clemence, Esq., Lowestoft.
- 45.—Essay on the Causes of the Migration of Salmon from Sea to River, as influenced specially by Height of Water, Temperature, and other Atmospheric Conditions. £15. James H. Crossman, Esq., London.
- 46.—Essay on the Natural History and Habits of the Herring, with Suggestions for the Improvement of the Fisheries of the same in the United Kingdom, to be considered as a source of National Wealth. £50. The National Fisheries Exhibition.
- 47.—Essay on the Herring Net, showing the best Mesh for the Capture of the Matured Fish, and means for making the use of such Mesh compulsory in Great Britain and other Nations fishing in the same waters. £21. The London Fishsalesmen's Association.

In addition to the Special Prizes and Government Medals, Gold, Silver and Bronze Medals and Diplomas of Honour will be awarded in respect of the Exhibits considered most meritorious by the Jurors in Classes 1 to 5, and Diplomas of Honour only in Class VI. of Loan Collections of the General Classification.

W. OLDHAM CHAMBERS, Hon. Sec., Lowestoft.

CORRESPONDENCE.

[We do not hold ourselves responsible for opinions expressed by our Correspondents.]

CURATORSHIP OF THE BUCKLAND MUSEUM.

SIR,—You do not know with what surprise I read your correspondent's (Charles C. Capel) letter under the above heading, and had not the least idea that Mr. Edon, the present curator, was leaving, or at any rate likely to be succeeded in his curatorship; he being, in my estimation, at any rate up to this present time, the right man in the right place. I knew the museum when in its infancy, and the former curator, Mr. Neville, therefore can say that I have known Mr. Edon during the whole of his curatorship; and more than that, shall never forget the day—and a bitter cold day that was, too—when our dear departed friend, Mr. Frank Buckland, Mr. Edon and myself, were wading the river breast-deep from 10 a.m. until 5 o'clock p.m. at Totness weir and other parts of the river as far as the Seymour Hotel, Totness Bridge, catching salmon and taking the ova which was sent out to various stations in New Zealand, &c., &c., which I am happy to say have succeeded admirably. Mr. Edon was at that time very unwell; but for all that his repartees to lots of remarks made while spawning the fish and packing the ova, pronounced him more than equal to the position he was then fulfilling. I have always found him ever ready, and when in London last February I called to see our dear friend Frank Buckland, who wished me to see as much of the museum as my time would admit. Mr. Edon placed himself entirely at my disposal, and for two whole days did I avail myself, which enabled me to see many new specimens, and also found the whereabouts of several specimens which I had presented to Mr. Frank Buckland since I have been in Devon, and of which splendid plaster casts have been taken; but the principal and most arduous, yet most beautiful portion of Mr. Edon's work is the fish-hatching apparatus, of which there are an immense number, and it is astonishing the thousands of fish annually brought to perfection, and should Mr. Edon be recalled from that position, which he has so well filled, I think with your correspondent it will be a great shame so to treat a worthy public servant—I am, &c.,

FRANK GOSDEN,
Ex-conservator of the River Exe.

LONG LIFE OF JACK.

SIR,—Visiting a friend in North Staffordshire this Christmas, a brother of the angle, and a constant reader of your valuable paper, our conversation naturally became "fishy," and he informed me of the undermentioned facts, which occurred some years ago, relative to the length of time a jack lived after being taken out of the water, which, if you think of sufficient interest, perhaps you will kindly insert in your GAZETTE.—I am, &c.,

19, Norfolk Road, Dalston.

B. SIMKINS.

My father being one day, during the shooting season, about noon down by the California Hole, saw a pike lie some four or five inches deep in the water. My father shot, and an old spaniel he had with him plunged into the water and brought out the pike, weighing about five pounds. The fish, which was shot about noon, had a string passed through its gills, and was carried by the string through the woods for the remainder of the day, being brought home about five o'clock in the afternoon. The string was then taken from the gills and the fish, not showing any signs of life, was put on a large dish and placed on an upper shelf in the dairy. Towards eight o'clock, one of the servants having heard that a pike had been killed, went to look at it, and not being content with looking touched it, when, to his surprise, it sprang off the dish on to the floor. He immediately came and related what had occurred, and on going to look we found it as he said. We then took the pike and placed it in a large cistern of running water, where it soon came round, seeming none the worse. It remained in the stone cistern for about a month or six weeks, when it was killed—this time in reality.

A CORRECTION LEADING TO A PERSONAL MATTER.

SIR,—Will you kindly allow me to state that the positively untrue statement which Mr. Spence alleges that I have made is not erroneous. By a typographical error the words "trout with" have been omitted before the portion of the sentence quoted by Mr. Spence—"almost white-coloured fins"; at least, as far as I am aware, I wrote as now stated. The white colour to which allusion is here made being the semi-transparent, yellowish white hue seen in parr and some salmonide, as distinguished from the creamy, or sometimes snowy, white border found on the front part of some of the fins of true trout.

In relation to Yarrel, Mr. Spence, on Dec. 4, himself retracted his erroneous statement in his letter of Nov. 13th, whilst persisting in using the words parr and samlet for the same fish, so as not to enable an opponent to know of what he was writing; and now finally covers that which is at least gross carelessness in quotation, by abuse, and accuses me of what he calls bad punctuation.

I do not wish to follow this example, and therefore still remain, as of old,

THE RAVEN.

[We have examined "Raven's" manuscript and find that the words "trout with" are there, but so blurred as to be almost illegible, and the compositor thought they were erased.—ED.]

PISCATORIAL CELEBRATION.—In looking over a New York paper I found the piscatorial celebration mentioned of the Cincinnati Angling Club, with their president, vice-president, secretary, and twenty-five members. About twelve or fifteen met the day before, and angled for a day and a half with capital success, having caught within that time three hundred and fifty-three bass and salmon, some very large. They spent a very pleasant day, and amongst their toasts they gave "The Memory of Isaac Walton and Charles Cotton." The members of the Pittsburgh Angling Club, the Schuylkill Fishing Company, are still flourishing in full vigour, at the advanced age of ninety-eight years. It appears from these statements that there are angling clubs formed in several parts of North America.—Editor of "Piscatorial Reminiscences," 1835.

MRS. F. Y. BROCAS, Artificial Fly Dresser, 4, Mill-street, Conduit-street, Hanover-square, London, W. A stock of best flies always on hand. Flies made to pattern. Lessons in fly making given.—[ADVT.]

FISHING RIGHTS ON THE THAMES.

(This correspondence will be interesting to many of our readers.—ED.)

Board of Trade (Harbour Department),
Whitehall gardens, S.W.,
23rd November, 1880.

SIR,—Referring to your letter of the 12th ult., calling attention to alleged attempts to interfere with the rights of the public in the use and enjoyment of the River Thames and its towing paths, I am directed by the Board of Trade to enclose, herewith, copy of a communication from the Thames Conservancy Board, for whose observations your letter was referred by this Board.—I am, &c.,

G. H. Cook, Esq., Caterham Valley, Surrey.

Thames Conservancy,
Offices: 41, Trinity Square, Tower Hill, E.C.
18th November, 1880.

SIR,—I have laid your letter of the 29th ult. (H. 6765), with its enclosure, before the Conservators of the River Thames, who direct me to state in reference to the remarks in Mr. Cook's letter as follows:—

FISHING RIGHTS.

Below Staines, no person claims any right of private fishing, and the public fish in all parts of the river Thames and the side streams.

On the river between Staines and Cricklade, the limit of the Conservators' jurisdiction, claims to private fisheries on the part of the riparian landowners have, in some instances, been brought before the magistrates, whose decisions the Conservators believe to have been conflicting. The Conservators have not supported any of these claims, nor do they recognise the right of any persons to prevent the public from navigating the side streams or small branches of the river.

The Act of 1866, transferring the jurisdiction of the river Thames above Staines to the Conservators, confirmed the reservation of the rights to private fisheries provided for by the Act of 1864.

In making the bye-laws for the protection of fishing in all parts of the river, the Conservators allowed the owners of private fisheries to use certain nets and engines, under special restrictions within the limits of those fisheries, a statutory declaration having previously been made by each claimant setting forth the grounds of his title.

TOWING PATHS.

The towing paths below Staines are entirely in the hands of the Conservators being either their property or rented by them; in no case has the reasonable use of these tow paths by pedestrians been interfered with.

Above Staines, the towing paths are almost entirely the property of private owners, to whom the Conservators make an annual payment for the use of the towing paths solely for navigation purposes.

The Conservators have, therefore, no power to oblige the owners or occupiers of these towing paths to allow the public to use them for any purpose except that of navigation.

The ferry boats in the hands of the Conservators were established solely for ferrying over the horses and persons employed in the navigation.

It has been a convenience to allow foot passengers to be ferried over in these boats, and in most cases the boats are used in this manner; but in two or three instances owners or occupiers have complained that persons have been landed on their land without permission, and were, in fact, trespassers.

The Conservators therefore felt bound in these cases to stop the public using the ferry-boats, except for navigation purposes, especially as the Conservancy Act of 1870 declares that the establishment of a ferry shall not give a right of way over any towing path or other place where a right did not exist at the time of the passing of that Act.—I am, &c.,

E. BURSTAL, Secretary.

The Assistant Secretary, Harbour Department, Board of Trade.

OTTER CAUGHT BY LINE AND HOOK.—Mr. John Wane, of Penrith fishing with bait in the Eamont, at a place called Udford, caught a young otter, and, after much difficulty, succeeded in taking it alive. Whilst he was taking the young one out of the water, two old ones made their appearance and had nearly succeeded in rescuing it. Mr. Wane was an excellent line-fisher.—*Sport Mag.*, vol. xlv.

OWL CAUGHT BY ANGLING.—We ourselves once caught an owl—not with the fly, nor the worm, nor the minnow, but with the live mouse. As soon as he felt himself hooked, he sailed away to Josey's barn—in at a hole, and on to a bulk; but after a desperate struggle, and with the aid of a terrier, we captured him on the hay-mow, had him stuffed, and he is now in the museum of our University.—*Blackwood*, July, 1835.

MISCELLANEOUS EXTRACTS FROM MR. JESSE'S GLEANINGS IN NATURAL HISTORY.—The perch is the boldest and most familiar of any of the fish. I found no difficulty in getting them to come with eagerness, and take a worm out of my hand. The barbel were the shyest; when not seen, they would show considerable playfulness. The trout appeared to bear their confinement with less philosophy than any of the others. The chub were also very restless, being constantly on the move, but they could never resist a cockchafer when thrown to them. Flounders moved at night. Eels always made their escape; they had no other way than climbing up the brickwork. The carp and tench were soon reconciled to their situation. The pike, of which I had eight, about 5 lb. each, kept up their character for voracity. Out eight hundred gudgeons counted into the reservoir, there was scarce any to be seen at the end of three weeks. I should mention that three large barbel, and six good-sized perch, probably partook of them. But of all my fish, the bleak were the most amusing and playful. Fish have the power of hearing the firing of a gun; they have also the sense of smelling, by preferring paste and worms that had been prepared with different perfumes; they have also curiosity and affection. For further information, the account which Mr. Jesse gives of his "Piscatorium," is, like his work, uncommonly amusing. Fishes that swim and take their food near the surface, die soon when taken out of the water, as trout, dace, mackerel, and herring; on the contrary, those fishes that swim and feed near the bottom are all tenacious of life, and continue to exist for many hours after their removal from the water, such as carp, tench, eels, and all flat fish.

NOTICE.

Communications relating to the Literary Department, Fishing Tackle for Notice, Books for Review, &c., must be addressed to the Editor of THE FISHING GAZETTE, No. 12, Fetter Lane, London, E.C. and should reach the office not later than Tuesday morning. Contributions are solicited, but the Editor will not undertake to return rejected MSS., unless accompanied with a stamped addressed envelope.

Correspondents are requested to write on one side of the paper only and give their real names and addresses, not necessarily as signatures to their letters, but as a guarantee of good faith. Unless this rule be adhered to no notice will be taken of such communications.

THE FISHING GAZETTE is published every Saturday, and can be obtained at Messrs. W. H. Smith and Son's Railway Bookstalls, and of the following, amongst other Fishing Tackle Dealers in London and the Provinces:—

Messrs. Alfred and Son, Moorgate-street.
Messrs. Price and Co., 8, Seymour-street, Euston-square, N.W.
Messrs. Williams and Co., Great Queen-street.
Messrs. Gee and Co., St. Andrew's-street, St. Martin's-lane.
Messrs. Gee and Co., Gray's Inn-lane (near Holborn end).
Messrs. Little and Co., Fetter-lane, E.C.
Messrs. C. Kewell and Sons, 197, St. John-street-road, E.C.
Messrs. Kewell and Co., 1A, Conduit-street, Regent-street, W.
Mr. J. Richards, 97, Church-street, Paddington.
Mr. W. Leader, 39, Upper Marylebone-street, Portland-place, W.
Mr. — Clark, 35, Wells-street, Camberwell.
Mr. Geo. Road, 97, Goldsmith's-row, Hackney-road, E.
Mr. A. Bulmer, 62, Wandsworth-road.
Mr. F. Oliver, 188, Great College-street, Camden Town.
Mr. J. E. Gold, 284, Waterloo-road.
Mr. D. W. Willoughby, 27, Lombard-market, Battersea, S.W.
Mrs. F. Y. Brocas, 4, Mill-street, Conduit-street, Hanover-square, W.
Messrs. Gillett and Co., 40, Fetter-lane, London.
Mr. Alfred Young, "The Golden Perch," 174B, Oxford-street, W.
Mr. T. Barnett, 26, Church Street, Lisson Grove, N.W.
Mr. J. Smith, 7, Tottenham Court Road, London.
Mr. Edwin Stevens, Newsagent, 220, Kentish Town Road.

or

Mr. B. R. Bambridge, 74 and 75, High Street, Eton, Bucks.
Mr. Cowan, 33, South Frederick-street, Edinburgh.
Mr. H. Whitty, 15, Bassett-street, Liverpool.
Mr. C. J. Greene, 54, London-street, Norwich.
Mr. R. Ramsbottom, 81, Market-street, Manchester.
Mr. James Gregory, Vyse-street, Birmingham.
Mr. Wm. Bailey, Jun., 29, London-road, Nottingham.
Messrs. Nutting and Co., 70, Edgbaston-street, Birmingham.
Messrs. W. C. and J. Penny, Booksellers, Froome.
Mr. E. Perks, Evesham-street, Redditch.
Mr. J. Walsh, Bookseller, 5, Harpur-street, Bedford.
Messrs. H. and C. Treacher, Booksellers, Brighton.
Messrs. Gaynor and Son, 10, Royal-terrace, Richmond, Surrey.
Messrs. O'Handlen and Co., 48, Victoria and Temple-streets Bristol.
Mr. Wilkes, Gunmaker, Leeds.
Messrs. Cayless and Sons, Midland Tent Works, Loughborough.
Miss G. Wells, 1, Sussex-street, Nottingham.
Mr. Wm. Atkinson, Fishing Tackle Maker, Lancaster and Kendal.
Mr. John Wells, 4, London-road, Nottingham.
Messrs. Mitchell and Co., 50, Market-street, Manchester.
Mr. J. Croisdale, 56, Briggate, Leeds.
Mr. John Keeling, the Golden Salmon, 7, Digbeth, Birmingham.
Mr. John Heywood, Manchester.
Mr. John Cocks, Baker Street, Weybridge, Surrey.
Mr. Wm. Reid, Northgate, Darlington.
Mr. R. Pearsall, 11, Great Western Arcade, Birmingham.
Mr. G. T. Gibbons, 10, Bridge Street, Salisbury.
Mr. Thos. Heppleston, Manchester.
Mr. J. Perry, Minster Parade, Reading.
Mr. S. Dale, 7, St. John Street, Nottingham.

Newsvendors can obtain the journal through their London Agents.

* * The "FISHING GAZETTE" SPINNER (Registered) is sold by all the above firms.

ANNUAL SUBSCRIPTION.

The Annual Subscription, payable in advance, for the United Kingdom is 8s.; or post free, 10s. 6d.

To any part of Europe, the United States, and Canada, the Annual Subscription, including postage, is twelve shillings and sixpence.

ADVERTISEMENTS.

All communications respecting advertisements must be addressed to the Manager of THE FISHING GAZETTE, No. 12, Fetter Lane, London, E.C.

N.B.—All Remittances must be sent, and all Cheques and Money Orders must be made payable to ROBERT B. MARSTON.

The Fishing Gazette.

SATURDAY, JANUARY 29, 1881.

SHETLAND AS AN ANGLING RESORT.

TO all those who are on the look-out for a spot in which to spend their next holiday, not too difficult of access, yet not till now overrun by the British Tourist; a spot where fair, sometimes first-class, angling, and a little wild shooting, with a chance

of birds rare on the mainland of Britain, together with a bracing climate, can be obtained with economy, we say, try Shetland.

Those who have tried it there is no need to advise to return, for any one who has mastered the rudiments of angling will get sport sufficient to entice him back, not to speak of the hospitality of the people and the general "good times" he is sure to enjoy. Hospitality, to be sure, is here a necessity, as, so far as we are aware, there are only two inns in the islands outside of Lerwick, the capital, and of these one is so dirty that we cannot conscientiously recommend any one to try it; for having, on one occasion, had the misfortune to be storm-stayed there for two nights, we set off on the following morning on spec, not knowing where we should lay our head that night.

But let us commence at the beginning. Our first consideration is how to get there. Lerwick, the port and capital of the islands, is some four hundred miles north of Edinburgh; and as Edinburgh is, by rail, about the same distance from London, the distance to be overcome is considerable, and the time necessarily consumed in going and coming makes it impossible for any one having less than three weeks of freedom to manage this trip. At the same time, those who have time can perform the whole journey by boat, changing steamers at Leith or Aberdeen, so that the bother of luggage is reduced to a minimum. During the autumn the boats leaving Leith for Shetland are apt to be much crowded; but as, we believe, an extra mail-steamer is to be run next summer, this objection will to some extent be obviated. The boats used to run on Tuesday and Friday mornings, but of course this may be changed when the new arrangement comes into force. A return ticket, Leith to Lerwick, available for a month, costs thirty-nine shillings, and the average length of the passage may be set down as about thirty-six hours, though we have seen it so little as thirty-two.

Of course, the voyage is sometimes a little rough, and we have noticed stray specimens of the British Tourist who have found their way so far north looking most miserable; but your sportsman is, as a rule, made of sterner stuff. *Experto crede*, a good dose of castor-oil is the best preventive of sea-sickness going.

The voyage is broken at Aberdeen, Wick (Friday sailings) and Kirkwall, so those who have no appetite on board can escape starvation by getting their meals ashore. We scarcely think that many will be of so economical a disposition as a friend of ours, not a brother Scot, who, in summing up his probable expenses, said, "If I'm so lucky as to be sea-sick, that will be so much saved."

At Lerwick our sportsman's troubles begin; there is no pier fit for large vessels to be alongside of, so passengers have to be landed in small boats. The steamship company land those who wish in the mail-boat, free of charge. The usual fare for a private boat is a shilling a head, far too much for a row of less than a quarter of a mile. There is, however, this advantage in "having a boat of yer ain," like the M'Nab of Noah's time, that you can get your boatman to carry your luggage to an hotel or boarding-house.

This matter of hotels used to be a very serious one; there are only two in Lerwick, which used to be badly-managed and dear in proportion to the accommodation supplied. Matters are much better now, we are told; but for ourselves we should infinitely prefer a boarding-house, and can strongly recommend Mrs. Crutwell's, which is close to the pier where the mail-boat lands. It is clean, quiet, and the food and attendance good; besides which, as it is much frequented by the "old hands" who frequent the islands, a stranger may get a "tip" as to what sport to expect and where to go.

The next step is to get out of Lerwick, for the sport to be had in the neighbourhood is much inferior to that to be obtained else-

where; so a prolonged stay there, unless you can get leave for Loch Strand, of which more anon, is unadvisable.

The less baggage you have the freer you are; and if you can carry your belongings on your back so much the better for you, for then you can trust to your own legs. Hiring is expensive and dreadfully slow; so slow that the writer has started only one hour ahead of a party "hiring" to Walls, about twenty-six or twenty-seven miles by road from Lerwick (the machine was, of course, late—your true-born Shetlander has no idea of the value of time), and by dint of short cuts and a ferry, which saved two miles, arrived there fully an hour ahead, to the great disgust of the occupants of the dog-cart. This excessive slowness is due to the native custom of getting out of the trap to walk up all the ascents and down most descents. As the road is very hilly, a drive is not unlike Paddy's ride in the bottomless cab—if it were not for the honour of the thing, you might as well walk.

By far the pleasantest, and, we believe, most expeditious way to travel in Shetland, is by sailing-boats; and this method also allows a good view of the magnificent rock-scenery, which can, indeed, be properly seen in no other way. Unfortunately, however, at the very time when the islands are most frequented by visitors, the main body of the men are away at the different fishings; so those who remain have visitors at their mercy, to a certain extent. Always remember, in bargaining with a Shetlander, that you must expect him to ask more than he means to take, and that you will certainly have to pay more than a native would.

It is our intention at present to treat of the western peninsula of the mainland, principally because we are better acquainted with that part of the islands than any other; and because, both from our own experience and the reports of others, we believe the fishing there to be, under ordinary circumstances, the best in Shetland.

This district we may sub-divide into two parts—the Wiesdale division, and that accessible from Walls; these being the two places at which lodgings can be most easily obtained.

There are three courses open to the traveller who wishes to reach either of these places. He may either walk, hire a machine, or try for a seat in the mail-gig which leaves Lerwick for Walls every night on which the mail-steamer arrives. The fare by this last is four shillings to Wiesdale, and the same from Wiesdale to Walls, luggage being charged for separately; but it has this drawback—that it usually starts between 11 p.m. and 2 a.m., reaching Wiesdale between 3 and 5 a.m., and Walls about 11 next morning—not very comfortable hours to be crossing bleak moors and hills bare of all shelter, even in fine weather.

Wiesdale, to which we intend to lead our readers in the first place, lies at the head of a long narrow Voe (narrow arm of the sea) about half way betwixt Lerwick and Walls, and boasts of one of the two inns to which we referred previously. In this inn we have frequently stayed, and found it both comfortable and moderate, and lodgings can be had elsewhere. For purposes of description, we shall suppose the traveller to walk. Let him leave Lerwick by the north road—which, after passing round the foot of the fort, runs in a north-westerly direction for about two and a half miles; he will then find himself looking into a deep valley through which a burn—the Dales Burn—preserved by Messrs. Hay, of Lerwick, runs. This is a most disappointing stream; it looks fishy, and at times contains a few sea-trout, but is literally crowded with small fry both of river and sea trout. Crossing this glen our wayfarer sees before him another valley equally deep, but less confined; to his left he sees a lake. (There are no lochs in Shetland; they are there called lakes, or, more commonly, "waters," though the Shetlanders, in speaking to strangers, often use the word loch; by way, we suppose, of bringing themselves to said strangers' level.) This is Tingwall Lake, where the Thing, or

parliament, of the islands was wont to meet—how handy for treating obstructionists to the cold-water cure! It contains good trout, but from its proximity to Lerwick is a good deal fished, hence the fish are more fickle than in most Shetland waters; still a decent fisher should be able to take ten or twelve pound weight on any fair fishing day, but it contains no sea-trout, for which most visitors to Shetland look.

About a mile and a half to the spectator's right, however, lies a loch of a very different character—to all appearance an insignificant pond, fed by a streamlet such as schoolboys in less favoured climes frequent for the purpose of catching sticklebacks and minnows—the Loch of Strand, with its adjacent voe, gives probably the best sea-trout fishing in Shetland, but it is preserved by Messrs. Hay, of Lerwick.

At the spot where we have supposed our traveller to be standing the road bifurcates, the right-hand section going almost due north past the Loch of Strand, whilst that on the left runs almost due west, and it is this latter which leads to Walls. Of the next few miles of this road we have little to say. There are no lakes or burns near the road of a trouty nature, and the only thing worthy of remark is a magnificent view from a place called Wormidale, from which you have a splendid outlook over three splendid voes, studded with rocky islands; while to the west, the bold promontory of Skelda Nep, and in the blue distance the mighty cliffs of Foula may be seen; whilst, on the south, the famous Fitful Head rises. Turning abruptly round the corner of the hill, the road displays to view the Loch of Strome, discharging its waters by a short stream, crossed by the road into Stromness Voe. This loch, which is of considerable size—about three miles long by more than half-a-mile in the broadest part—is one of a kind not common anywhere, but oftener found in Shetland than any other place we know of; it is in reality an arm of the sea, but the communication being very narrow, and there being a considerable burn flowing into its upper end, the water is sometimes very salt at one end and only brackish at the other. Sea-fish are to be found at one end, common trout at the other; and all through the loch, one is, at every rise, in a pleasing state of uncertainty as to what your captive may be. We have caught, within ten yards, common trout, sea-trout, and peltachs (the second stage of the coal-fish), and have been informed that cod and herrings have been found in it. We have never done much in this loch, but a friend, who was once in the habit of fishing it a great deal, assures us that when the requisite local knowledge is obtained it is well worth a visit. He says, however, that one must know it by land, or rather water, marks, in the shape of stones, which there is no time to do in the kind of hurried visit we are sketching. After, or better still, during a flood, the stream already referred to as entering the head of this loch contains numbers of good sea-trout, besides being full of fry and common trout. We well remember our first visit to it, when, in the midst of a torrent of rain, with light trout tackle and a nine-foot rod, we hooked, in about an hour, over a dozen very large sea-trout; but being unprovided with landing-net or gaff, had to try to drag them up the steep banks, with the not unnatural result of losing all but one or two of the smallest. We had on two or three of close on four pounds each, and one certainly quite five pounds; but though well-hooked, and played to the last gasp, their weight was sufficient to break the hold when we tried to pull them up a distance of three or four feet. Our favourite flies for this, and, indeed, most Shetland burns, are teal-wing with black hackle and red body, claret hackle with orange body, and a jay-wing with blue hackle and black body, all three dressed with silver tinsel.

This burn, which has a course of some eight or nine miles, passes through two lochs called, respectively, Sand Water and Petta Water, both of which contain numbers of loch-trout, and are

said to hold sea-trout; this is probable, as there are no obstructions on the burn fit to stop sea-trout; but though we have often fished for them in these waters, we never saw any.

Returning to the road, we pass another sheet of water, similar to Strome in having a free communication with the sea, but differing from it in having no fresh-water tributaries; it is called Huxter Water, and contains no trout of any kind. About a quarter of a mile farther on, stands Airv House Inn, which we have already referred to, and about a mile and a quarter beyond that is the head of Wiesdale Voe, where the burn of the same name joins the sea. This is a capital burn; though a good deal fished, the fish never seem to get shy, and a spate is sure to bring up large numbers of fish; whilst, when the water is not dead-low, there is always a ginnock or two to be picked out of its pools, by using small flies and delicate tackle, or, better still, by fishing worm in the way suited for such streams. The space in which the sea-trout are found under ordinary circumstances is limited to about half a mile, as, except in very heavy floods, the fish are unable to ascend a dam which supplies water to a flour mill. The largest fish we ever landed in this stream was 6 lb., but we are informed that they have been taken 14 lb. weight. The common trout are small and worthless. As this is a small stream, such as an active man could jump across, under ordinary circumstances, and has no locks to keep up the supply of water, we need scarcely inform our readers that the fishing is most uncertain, a remark which may be applied to the whole district, so far as sea-trout are concerned. The same flies as were mentioned as useful in Strome Burn are good here; besides which, we have done well with teal wing and green body, and woodcock wing, with red body and hackle. As to the size of hooks, we generally use a No. 7 or 8 Limerick, but when the water is low, reduce this to No. 10.

The accommodation to be had here is, of course, limited. We have been in the habit of putting up at the inn, or at a small croft about 100 yards west of Wiesdale Bridge, held by a Mrs. Hunter, where we found ourselves comfortable in a rough way. We believe that accommodation can also be had at the school-house, and Mr. Smith, at the flour mill before referred to, told me last autumn that he intended to fit up two rooms for the accommodation of anglers. This last would certainly be very central for fishing the whole district, especially as a new road is being made, connecting the north road at Sandwater with that to Walls.

Before going farther, it may be as well to mention a fine common-trout loch, which should, perhaps, rather belong to another district, as it lies by the side of the north road, about thirteen miles from Lerwick, but, as it is most easy of access from Wiesdale, we may mention it here. This water, called Girlesta, lies about four miles due east of Wiesdale; the road makes it about six, so it is most easily attained by climbing two ranges of hills, and crossing the valley of Strome Firth. It is well worth the trouble, as it holds fine trout, and it is said that sea-trout were shut up in it by the building of an embankment at the foot, and bred there; it certainly holds trout quite undistinguishable from sea-trout as to outward appearance. It is also said to hold red-bellied trout (char, perhaps), but these we have never seen. We heard a rumour last year that this loch was to be preserved. The flies must be small, and we have generally found a white tip, with green or purple body, taken best; but the fish are very shy, rising best in a gale. There are two or three other small lochs near this one, but we have never tried them, though no doubt they all contain trout.

To the west of Wiesdale Hills the whole country is studded with lochs and burns, which may be divided as follows:—Burn of West Burrafrith, with its lochs; Lochs discharging into Aith Voe and the Clouster Loch, which last are half-way between Wiesdale and Walls; all these discharge to the north side of the island.

On the south side there are no lochs till we reach the Walls district, but two fair burns, at Toomlin and Bixeter.

To reach the first-named lochs, which are about three miles from Wiesdale Bridges, you must climb the steep sides of Wies-Hill, when you will see three lochs lying to the north-west; make straight for these. The two nearest are called Maa and Truggles Waters, and discharge into the Atlas Burn, which, after a round-about course, join West Burrafrith Burn, which latter stream rises partly from Lamba Water, the remaining loch. All these lochs are of a very similar character, deep and peaty, containing quantities of common trout, about three to the pound, and easily taken, but they hold no sea-trout. There are several other small lochs sending tributaries to Barrafrith Burn, but we have never fished them. There is a very pretty fall on this stream, above which, of course, there are no sea-trout; but a few are to be had in it after rain between this and the sea, a distance of nearly a mile. We are told the estuary is much netted.

Proceeding westwards, across the moors from Truggles Water, we find, at the head of Aith Voe, a weedy loch connected with the sea by a mere ditch, and containing fine trout, of high quality from a cook's point of view, and giving fine play from the angler's point of view. The average varies much with the character of the day, but is between half-a-pound and three-quarters, and there are plenty of them. It is named Houser Water. Into the west side of the same voe, a loch, whose name we do not know, empties itself. It is deep, of considerable extent, and holds good trout which rise freely; and we are told that sea-trout are found there at times, but don't believe it, as we believe our informant confused this with Clouster Loch, which lies near.

Separated from this loch by a low hill, and to the south of it, we find another good-sized loch called Var, which discharges into Clouster Loch. We came upon it in the gloaming one day as we were returning to Wiesdale from an exploring expedition, and as we had quite seven miles of bog-trotting before us, only fished about half-an-hour, during which time we took nine trout, the largest a pound and a quarter, the rest between that size and half-a-pound, so we imagine it must be good, and, from its inaccessible position, but little fished. Of Clouster Loch we have only fished the upper end, and that during an almost dead calm, so can only speak of it from report. It is said to be a capital loch both for common and sea trout, but, unless lodgings can be had at Vimentry, perfectly inaccessible, and, from its extent, must take a "great deal of knowing."

We give a table of distances from Wiesdale Inn to the places just mentioned. Tingwall Loch, 7½ miles; Strome, Burn and head of loch, 1½ miles; Sandwater Loch, 3½ miles; Girlesta Loch, 4 miles; Peta Water Loch, 8 miles; Lamba Water, &c., about 4 miles; Burrafrith Voe, 6 miles; Houser Loch, 5 miles; Loch Var, 7 miles; Loch Clouster, about 8 miles. All these distances are, of course, only approximate, and strangers must bear in mind that owing to the boggy and broken nature of the ground a mile seems quite equal to two on a level turnpike, and if he lose his way there are very few houses, and those are always close to the sea. We have known an experienced bog-trotter, accompanied by a native, have to sleep out on the moors during a mist, which overtook them in a part of the country they were both well acquainted with, and have ourselves taken nearly four hours constant walking to find our way home, a distance of two miles, over a country with which we were well acquainted. SCOTUS.

[In spite of the drawbacks, we think our readers would be glad to take their chance—we should.—ED.]

GEORGE JAMES EATON, of Starkholmes Matlock-Bath, Derbyshire, respectfully invites Noblemen and Gentlemen to try his standard FLIES for the present season. No flies sent or made up but what he himself has proved sure killers. A trial is all that is required from gentlemen who can fish to prove whether they may be genuine or not. Patronised by some of the best fishermen of the day. All flies dressed on the best Kendal books. Prices: Point Flies, 2s. 6d. per Dozen; Dropper Flies, 2s. per Dozen. Orders punctually attended to.—[ADVT.]

MID-WINTER ANGLING.

ANGLING, as a sport to be pursued in the depth of winter, doubtless presents to the imagination of many, even to those who really enjoy a day's fishing, anything but the realisation of what may be called a day's pleasure; but granted that winter fishing is divested of those lovely accessories of blue skies and bright warm sunshine, there is no doubt much more and greater sport can be obtained during the winter months in our rivers than is generally believed by those whose acquaintance with piscatorial matters is but slight. Always leaving out of the question that select art of fly-fishing, the Act of Parliament recently passed prohibits angling for three of the most pleasant months of the year, viz., March 15th to June 15th, during which time most freshwater fish are out of condition, owing to breeding operations; then, during the next three months, the fish are very difficult to entice, owing to the fact that they get plenty of natural food from insects and water vegetation, on which they mostly feed in preference to any bait, however temptingly presented to them by the disciple of the rod; consequently, owing to wise legislation and force of circumstances, the wintry half of the year is left for the angler to pursue his pastime, at which time all fish except the trout are in the best condition, and afford, when hooked, the greatest amount of sport. "Possibly so," says our careful friend who cares not to face a cold day out. "Consider what may be the result: I might get my death of cold, or be frost-bitten, or sow the seeds of chronic rheumatism, or other unfortunate conditions of things may happen to me." My recommendation to such chilly mortals is, decidedly, "Do not go out fishing; stay in town, and go for a quiet stroll through some of the windy streets, and catch the chill you so much dread whilst stopping to admire some object of interest; at least, then, my favourite pastime will not be accused of your misfortune." What can be more bracing to the overworked man than a day off duty, —a bright and frosty day, away in the country anywhere on the Thames? A "City" bright and frosty day is nothing to one in the country; there it is clear, and the sun's rays warm even in the depth of winter, whilst in town you see the sun for a short time over the housetops and through the mist, and then it is gone, and it comes on cold and dark and you shudder at the idea of fishing, unless you are a regular angler and know from experience that clear of the town it is quite a different matter.

Let us leave the dull City after an early breakfast, and about nine o'clock (usual business hour) find ourselves near the river some twenty or thirty miles from "the office." A lovely bright morning, hard frost, and no cutting wind to chill us through and through; the stream is running clear and the very tint for our day's chubbing. With what a splendid sense of freedom do we row up-stream, after removal of our overcoat and wrappers (for the winter angler should be one of the most careful of his health in this respect), to be resorted to again when we stop rowing, as we now do, having arrived at those overhanging bushes under whose boughs in summer the great chub lay with their white-rimmed lips partly opened, ready to snap up the fly or bee which may be unfortunate enough to drop into the water, but under whose roots now they are securely ensconced; for in winter the chub love to congregate under the protecting roots of trees and bushes, and in holes in the river's bank wherever the water is deep and quiet. Carefully we tie our punt to the bushes ten or fifteen yards above that quiet circling eddy we intend to fish, examine our rod and winch, and neatly place upon our triangle hook a clean piece of pipe-like bullock's pith; now we throw in some chopped bait to draw the fish out of their fastnesses. See how the stream carries the little white pieces right into the eddy where they will sink and be carried under the roots, and over the noses of any chub who may happen to be at

home; out they will come to the welcome feed, and presently some big fish will espy the piece of pith, which we have meanwhile let float down stream, and dexterously manipulated right into the eddy, and as near the bank and roots as we dare. Our big fish will seize our bait in preference to all else; is it not bigger and whiter than those insignificant little pieces floating about? So thinks Mr. Chub, and he opens his capacious mouth; while above water, we, who are anxiously watching our float, suddenly see it sharply disappear; we strike quickly, and feel an instantaneous and firm resistance—a root, we imagine; no fear, that desperate plunge of Mr. Chub for the fastnesses of his abode dispels that thought almost sooner than it comes into the mind. We hold our rod firmly and don't give an inch of line, or he'll get round a root or something. Now we point our rod right out into the stream, and once we get our fish away from the banks and out into the current, then we can enjoy the sport of tiring him out. If he is a big and strong fish we let him have line only when we are in fear that his plunges will snap our tackle, and we wind it in again on the first symptom of weakness on his part, and finally triumphantly land our fish and catch more from the same swim; for when they are on the feed we can get many out of the same swim before the remainder become alarmed. No thoughts of the thermometer being nearly at freezing point worry us while the excitement of catching fish is on; and then, when the sport gets slow, untie our boat and row to another haunt of the chub, until finally, with a well-filled well, and a light heart, we row down stream, and arrive contented, and warm with our healthful exercise, and after partaking of a good tea we return to town and display the result of our skill and pluck to admiring friends, who exclaim, "Oh! what big fish. I thought there were only little ones in the Thames;" and, "How cold you must have been this dull, bleak day;" while really we have had the reverse of such a day, and have not felt cold at all, having thoroughly enjoyed ourselves and obtained that bracing relief to the mind and body of which we were in need. To the winter angler I would offer some advice: don't go out in a cold east wind, you will catch very little fish, and an east wind has the power of discovering the weak point in the strongest constitution; don't sit on the river bank all day, have a boat or punt and exercise your body; and never go out without a complete suit of waterproof, from boots to head-covering. The man who is careful on these points can have a day's fishing in the winter with as much pleasure and more profit than during the summer months.

R. W. H.

AMATEUR SEA-FISHING.

(Continued from page 39.)

THE turbot is often confounded with the brill, but it possesses very distinctive characteristics.

The turbot is of a remarkably round form, its eyes are exceedingly small, and sunk deep into its head, and between them is a slight crest; the mouth is large, and the jaws well-armed with small teeth, the lateral line is very much bent near the head. The dorsal fin advances towards the edge of the upper jaw, and extends as well as the anal, almost to the tail. The tail is rounded at the end. The upper side of the body is brown, marked with numbers of black spots, the belly white; the skin is without scales, but greatly wrinkled, and mixed with small short spines, dispersed without any order. A turbot, if in good season, is thick, and the belly of a yellowish-white, or pale cream colour; if thin, with a bluish cast on the belly, it is out of season.

The brill, which by many is much preferred to the turbot, bears a very close resemblance to it; but the body of the former is much thinner and narrower, and the eyes are also further distant from each other than in the turbot; it is also free from any

spines, and the skin is covered with small scales; the dorsal and anal fins are also less arched than those of the turbot. The colour of the upper side, also, is usually lighter than in the turbot, and is marbled or spotted in different specimens, generally with large and small spots of a deeper colour, and many small white spots sprinkled irregularly over the surface; the under side is of a pure white and scaly.

The brill, although said to be inferior to the turbot, is nevertheless a most excellent fish, and may fairly lay claim to the next place to him for goodness. We have before remarked that this fish is called a halibut in the neighbourhood of Plymouth, whilst in the North it is called a pearl; and, in addition to these names, on the coast of Cornwall it is called a kitt.

The turbot fishery was formerly wholly occupied by the Dutch. Such, at least, appears to have been the case in Dr. Brooke's time, as he, in his "Art of Angling," with the true feeling of a disciple of the piscatory art, justly reprobates the want of energy in his countrymen in allowing the Dutchmen to catch the fish from under their very noses, and sell them in their markets; the produce of which, after being safely deposited in the pockets of their broad and ample breeches (for which the inhabitants of that country have ever been so justly famous), was sure to find its way to the other side of the water. But times and men are much changed since Dr. Brooke's time, and now our fishermen may challenge any one in the world for activity, diligence, and perseverance. We now propose to give an insight into the manner in which this fishery is carried on, and will confine ourselves to such practical remarks on the subject as have come within our immediate notice.

The lines usually used in this sort of fishing are bolters, which frequently are even miles in length; the hooks are placed about a fathom apart from each other, and baited in the same manner as for cod and ling. Lines are frequently laid down for both descriptions of fish at the same time. The best baits are, we believe, herring and pilchard, or a moderate-sized herring-sprat put on whole. But sand eels, sprats, lampreys, common eels, either whole or cut in pieces, as also pieces of mackerel, garfish, conger, and, indeed, most small fish, either whole or in pieces, of a proportionate size, are often used with success; and it is also said that, when nothing else can be procured, that bullock's liver will do tolerably well.

The fishermen also, in addition to their other baits, frequently stick on small fish alive, which are by them considered to render the bait more attractive; as turbot, and in fact, most other fish, prefer seizing their prey alive. This plan, however, we have never tried. A turbot, when attached to the line, seldom makes any great stir, but from its particular form, and by means of raising its upper side, it is very heavy to raise from the bottom when it has been but recently hooked. One thing, however, the fisherman has not to apprehend, and that is, that the hold will give way, for a turbot seldom bites without swallowing the hook, which when once stuck in his throat is not easily disengaged. He should, therefore, be hauled up steadily; and if of any size, no attempt should be made to haul him on board without the assistance of the gaff. When the fish is fairly on board, the best plan is to cut the snead and put on a fresh one, and not run the risk of mangling and tearing out the gills, &c., in endeavouring to dislodge the hook, to say nothing of getting your hands well scratched, which, if our memory deceives us not, may happen. In order to make a turbot look well, it ought as soon as caught to be bled in the vein near the tail, which is generally visible through the skin, as it is otherwise apt to acquire a reddish cast about that part which gives it an unpleasant appearance. Although turbot are usually caught with spillers, yet it sometimes happens that they are taken with hand-lines when fishing on the bottom; but, as this has not often

happened to us, they have generally been supposed to be rays, till on hauling the fish near the surface, and looking over the boat's side, the absence of the tail of the former, and that peculiar sporting looking brown colour on the upper side, which can never be mistaken, has afforded the pleasing conviction of the value of the prize.

The smaller turbot are also frequently caught in dredging for bass, and also on lines banked between high and low water mark; but on the Cornish coast, to which our fishing has been latterly chiefly confined, we do not ever remember catching a single small turbot outside the breakers, though we generally succeeded in taking them between high and low water mark. The reason of this we suppose is, that when hungry they always come into shallow water in search of food; or, perhaps, the larger turbot may drive them in shore, and retain the deeper waters to themselves. The larger turbot certainly confine themselves to deeper water, and we never knew an instance of one over three pounds weight being caught between high and low water mark. Two pounds, however, was not all an unusual size, though, perhaps, a pound weight might be taken as the average. The best baits are sand eels, which cannot be too fresh. The brill is taken with the same baits as the turbot; the only difference seems to be that the smaller brills may be taken in deep water, as well as the larger ones, and are, in fact, much more rarely taken with banking and dredging than the turbot. Both the turbot and the brill may strictly be called sea-fish, their usual places of resort being sandy ground and deep water; but towards the herring and pilchard season, they usually approach the coasts in search of their favourite food. Yet it does not appear that they often pursue them into rivers, though the latter is found sometimes to do so, and at certain seasons of the year it is said to be common in the Elbe.

And now for the cookery—that is, how to boil a turbot, for we know no better way of dressing him. Soak your fish an hour or two in clear spring water and salt, before it is dressed; then score the skin across the thickest part of the dark side. The turbot kettle must be sufficiently large to hold the fish, and must contain sufficient cold water to cover the fish completely. Put a large handful of salt, a glass of vinegar, and a piece of horse-radish into the kettle; rest your fish on a fish-strainer, and put it into the kettle, and when it comes to boil, skim it well, taking care that no blacks fall into the kettle; let it, however, boil very gently for about 15 or 20 minutes; when done, drain a little, and lay it on a dish provided with a strainer, or else lay it on a dry napkin. Time was when the spawn of a hen lobster was most wantonly used to garnish the dish, as well as in making the sauce, but horse-radish makes a capital substitute. The best sauce is lobster, of which we have seldom seen too much; next shrimp sauce, or, for those who prefer it, plain melted butter. Brill or halibut should be dressed in the same way as turbot. In making lobster sauce, be careful only to warm it on the fire; for if it boils, it loses the fine red colour which renders it so pleasing to the eye, and consequently, to a great extent, the palate.

ANGLERS should always be provided with something to take away the swelling and poisonous effect of the bites of insects. They should also have with them something to apply to a cut or sprain. Pond's Extract reduces the swelling and inflammation, stops bleeding and pain, and hastens the healing process in case of any wound or sprain; and it has no equal for application to the bites and stings of insects. Therefore never go on a fishing excursion unprovided with a bottle of Pond's Extract. It is for sale at all chemists, at 2s. 3d., 4s. 6d., and 8s. 6d. per bottle.—[ADVERTISEMENT.]

TIRED HANDS AND ARMS.—Edson's Electric Armlets and Wrist Bands. Invaluable for anglers and gun sportsmen and highly recommended for all persons having tiresome writing, sewing, or music practice. They give wonderful energy and strength, enabling the wearer to accomplish tedious work with steadiness and comfort. Price 2s. 6d. per pair, silk web and fine steel clasps. Sent to any address on receipt of P.O.O. payable to J. Edson, the Electric Fabric Co. Patentees, No. 1, Charlotte Street, Bedford Square, London W.C.—[ADVT.]

RIVER REPORTS

Thames (Twickenham).

Since writing last week we have had quite a fête week on the ice, including skating and dancing by torchlight, lighted tar-barrels, and large bonfires every evening. Last Saturday an open tent was erected, with two large fires in the centre, and a whole sheep roasted, which was distributed among some of the gentry of the town, including Lady Adeliza Manners and sons, F. Ashton, Esq., J.P., and daughter, and many others, not forgetting the poor. The whole of the expense was defrayed by public subscription, and after paying the same, we handed over five guineas, the balance of the above; to our parish soup kitchen. The ice is now in a bad state, owing to the thaw setting in so rapidly, or otherwise Mr. Andy Anderson, of the Island Hotel, and myself intended to undertake the management of roasting a whole bullock.—A. PERRIN.

Lee (Co. Cork).

The fishing prospects on our southern rivers this season are not such as to fill us with favourable anticipations for the year '81. Very few spring fish have yet reached the upper waters, and in the short interval between this and the commencing of operations there will hardly be sufficient time for the stocking of the river, unless, indeed, that a lucky combination of constant flood and increased preservation intervene. The weather during the past month has been disappointing from an angler's standpoint. There has been no rain, and for the past fortnight the river has been quite frozen up. To-day, indeed, a welcome change has set in. A thaw has been succeeded by a gale from the south-east, followed by rain. We have hopes it will continue for some time, and, if so, the fish, which are already showing in the tideway, may be expected to run in considerably quantity. A break after a long spell of dry weather is generally followed by an immense run of salmon.

The Suir and its Tributaries (Clonmel, Ireland).

The season for salmon and trout fishing opens on Tuesday next, the first of February. Little hope is entertained of having much sport during the early part of the month, owing to the extreme severity of the weather for the past three weeks; for many years we do not remember such hard frost. To-day, we are glad to say, a thaw begins, and if we had a good flood this week to carry away the snow water, we might then have a prospect of some fishing. The cot-men will fare well, but the rod-men on the lower waters have seldom any chance of getting a fish till later on. The trout are always in bad condition and seldom take a fly on the river here, but on the many streams they take the spider flies rather freely, but like the worm best until the days begin to get a little warm. There has been only very little poaching, we are glad to say, for some time, and consequently we hope, as the water kept pretty high during the early part of the winter, that there will be a share of good fish for all the anglers. The best trout flies for early part of season are hares' ears, gold wrens and silver-black hackles.—DORA.

Trent (Newark).

Last Sunday I thought the weather showed indications of a break up of the frost, but it turned out to be a delusion and a snare, for it was only a temporary lull, to break out again with redoubled vigour; but to-day, Thursday, there seems to be a very good prospect for a thaw, which I hope will continue, if it should be a rapid thaw. I should think by the time this is in print, our river will be flooded; but I should advise anglers to procure a stock of cockspur worms; for as soon as the water gets into anything like condition, roach, dace, bream, &c., will be found to be nicely on the feed. I believe if the angler will operate on a swim about 6 or 7 feet deep, with a nice sandy bottom, he will find himself in luck's way. If any angler has the luck to be in a suitable swim to-day, Thursday, I believe he will find fish on the feed. The weather to-day is nice and mild, and thawing very nicely. In a few days I hope to be able to have some good sport.—THE TRENT OTTER.

Wye and Derwent (Derbyshire).

Angling operations have been quite out of the question during the past week owing to the severity of the weather. It has frozen keener than ever up to last night (Wednesday) when there were slight indications of the storm going, for we have had a slight downfall of both snow and rain, and it is much warmer to-day (Thursday) with every appearance of it turning to rain. There will be no angling while the snow continues, although both rivers are in excellent condition for all kinds of fishing. We have had a good many ducks and snipe on the Derwent during the past week, and many small birds have been picked up dead owing to the severity of the weather.—GEORGE JAMES EATON, Stark-holmes, Matlock Bath.

The Yore (Yorkshire).

Arctic weather still prevails in this county, although there has not been such a fall of snow as in the more southern districts. Both the Yore and Wharfe are frozen over with a considerable thickness of ice—much to the delight of the skating fraternity, who have, during the past ten days or so, made the most of their opportunities. In fact, one night an enthusiastic party of them ignited a tar-barrel on the banks of the latter river, and by its light skated to an advanced hour. Even granted that an improvement in the weather takes place this month, it will be at least the middle of February before we shall have any chance to get at the greyling; and then very little time remains in which they are fit to be taken. I am told that a great many fine salmon have

been found on the banks of the Yore, killed by otters; and, from personal observations, I am inclined to think that there are more of these brutes on that river than a great many people seem to think.—FRANCIS M. WALBRAN.
Jan. 25th.

RICHMOND PISCATORIAL SOCIETY.

THE half-yearly dinner of this young but flourishing society took place at the Station Hotel, Richmond, on Thursday evening. Mr. J. Munro, as usual, provided an excellent dinner, and the whole of his arrangements gave the greatest satisfaction. Mr. F. C. Olench (treasurer), and was supported on the right and left by Mr. Spreckley (treasurer), and Mr. Brougham (secretary), of the Thames Angling Preservation Society, while the vice-chair was occupied by Mr. Thomas Abbot, the treasurer of the Richmond Piscatorial Society. Dessert having been served, the Chairman prosed the usual toasts with commendable brevity, staying, however, to claim the Duke of Edinburgh as an angler.—Mr. Rowe responded for the reserve forces.—In proposing "Success to the Richmond Piscatorial Society," the Chairman referred to the manner in which the society was conducted, and the services it had rendered, and also acknowledged the kindness of those who had given prizes.—Mr. Dean, whose name was coupled with the toast, referred to the formation of the society in August, 1879, when they had only seven members, and to the excellent fishing which he believed would always be obtained between Teddington and Isleworth.—The chairman then presented the prizes won by the members of the society during 1880. The challenge cup given by Mr. T. Abbott, was won by the donor, together with 10s. 6d. presented by Mr. Crew, 5s. by Mr. Munro, and £1 1s. by the society. An equipment of fishing tackle, value £2 2s., presented by Messrs. Gaynor and Son, was won by Mr. Wm. Abbott. Prizes of 15s., presented by Messrs. Abbott, Rowe, and Houghton, and 6s., presented by Mr. Munro, were taken by Mr. Dean. Mr. Field was the winner of 10s., given by Messrs. Abbott and Houghton, 5s. by Mr. Abbott, 5s. by Mr. Ford, and a fishing-rod, value £1 5s., by Mr. T. Keyes. The health of the prize-winners was afterwards drunk, Mr. Thomas Abbott responding. The Chairman next proposed "The Thames Angling Preservation Society," speaking in high terms of the services rendered to that society by its treasurer and secretary, with whose presence they were honoured, and whose names he coupled with the toast. Mr. Spreckley, in responding, said his society endeavoured to do its best for the Thames Angler, their one object being to preserve the fish for the benefit, not only of the members of angling clubs, but also of the poorer angler who stood on the bank, and who, if he only got a barbel or a chub, made a meal of it. He hoped his society would secure their confidence and warm sympathy in all that they were doing. No doubt the river had been much improved during the last few years, although they had the basest and most crafty of men to deal with amongst the poachers. He appealed to them all to exercise watchfulness when they were near the river, and to immediately report anything that looked suspicious. The Thames Conservators were very busy at present, but he hoped that in a short time they would have netting done away with from Richmond to Kew Bridge, or at any rate to Brentford or Isleworth. He hoped they would soon be able to find a gentleman in Richmond who would take an interest in the matter, and to whom their keeper could go for support, assistance and advice.—Mr. Brougham also acknowledged the toast, and, in reply to a question by Mr. Thomas Abbott, he said that the portion of the river over which the Thames Angling Preservation Society exercised jurisdiction was not fettered by private rights, but measures were being taken to settle the question raised by the riparian owners higher up. Before resuming his seat he proposed the health of the chairman, who, he said, for many years manifested great interest in things piscatorial.—The Chairman responded, and afterwards proposed "The president and vice-president of the society."—The toast having been honoured, Mr. Gaunt, the honorary secretary, tated that H.S.H. the Duke of Teck (the president) was on a visit to the Duke of Edinburgh, and therefore unable to be present that evening, and Major Bull (the vice-president) was prevented from attending by a severe domestic affliction. The toast of "The treasurer and secretary" was also proposed by the Chairman, who remarked that they were both excellent officers, and Mr. T. Abbott and Mr. Gaunt responded, the latter stating that after the forthcoming audit he hoped to show that they had a handsome balance in hand, and that the society now had over 70 members. He also referred to several useful works in which the society had been engaged. The other toasts proposed by the Chairman were "The donors of prizes," acknowledged by Mr. Crew; "The Visitors," for whom Mr. W. A. Abbott responded; "The host," to which Mr. Munro answered; and "The Press," acknowledged by Mr. Dimpleby, of the *Richmond and Twickenham Times*. As the company included a large amount of musical talent, a number of songs and pianoforte selections of an unusually able character were given.—From *Richmond and Twickenham Times*.

GREGORY'S SPINNING BAITS.—"The Gregory," the "Flexible Cleopatra," the "Oxford," and the "Colorado," pronounced by all Anglers and the Press the best baits invented for salmon, trout, pike, and perch. To be obtained from all respectable fishing-tackle shops in the world, and wholesale from Messrs. S. Alcock and Co., Standard Works, Redditch. Flattering testimonials speaking of the efficiency of the baits have been received from the Right Hon. John Bright, M.P.; Mr. William Bailey, Nottingham; the Rev. E. C. Holt, Teddington; Sir William Calder, Kingston-on-Thames, &c. Gregory's registered Archimedean spinning tackle for pike and trout, now ready, is pronounced by the press the best ever invented. For use with dead bait. The tackle is complete in every respect, and can be adjusted to suit bait of any size. Has been tried with remarkable success.—See that the name "Gregory" is impressed on the Archimedean fins, as inferior imitations are offered for sale, and people are thereby disappointed and deceived. Address, James Gregory, Vyse-street, Birmingham.—[ADVT.]

MRS. F. Y. BROCAS, Artificial Fly Dresser, 4, Mill-street, Conduit-street, Hanover-square, London, W. A stock of best flies always on hand. Flies made to pattern. Lessors in fly making given.—[ADVT.]

NOTES ON THE NATURAL HISTORY OF FRESH-WATER FISHES.

By J. HARRINGTON KEENE.

TENCH.

"EPHEMERA" describes the tench as a "mucous blackish olive carp," and the description is good: but Yarrell more correctly and fully speaks of it as follows:—The length of tail alone being considered 1, the total length of the head, body, and tail fin, is as 5; depth of body at its deepest part is one-fifth more than the length of head; all fins are rounded at the extremities; tail fin not at all forked, nearly square with corners rounded off; mouth small and toothless, with one barbel at each corner; scales very small; colours: head, sides, and cheeks, golden green, darker on the back and fins, orange yellow under the belly, irides bright orange red. Carp and tench are usually connected—as are roach and dace—colloquially. Why, is not apparent, except that they are usually found in association. In some respects there is a total dissimilarity between them. Thus, the carp has the largest scales of any fresh-water fish; tench have the smallest. Carp are known to be a good bait for pike, whilst tench is the worst, or one of them. In their general habits, also, they are widely different from each other.

The spawning season is a momentous one to tench. They go stark raving mad at this time; dancing, prancing, and gambolling with most absurd and antic vigour; now pursuing one another until almost on dry land, and anon resting side by side stubbornly refusing to be alarmed at anything. I have taken many a tench with my hand during this period of mental aberration. The ova, which is shed amid the weeds in somewhat shallow and muddy spots, is greenish in hue and prodigiously numerous. In a female of $3\frac{1}{2}$ lb., no less than 297,000 eggs have been estimated.

The angler may always distinguish between the male and female by the shape of the ventral fins. In the female these are of ordinary size and shape, but in the male they are like a green concave shell, the concave side being uppermost. The age to which tench attain is not known with certainty, but fifty years has been recorded as the limit.

Tench are excessively tenacious of life, and the very best way to transport them any long distance is to pack them in wet moss loosely, unless, of course, the thermometer points very high: If packed with ice, this does not signify, however.

The power of hybernation possessed by the carp is greatly enhanced in the case of tench, and it can live and grow big in almost impossible places. Daniel, in his "Rural Sports," speaks of one which weighed 11 lb., and was found in a most peculiar position. Here is the account of it in his own words:—

"A piece of water which had been ordered to be filled up, and into which wood and rubbish had been thrown for years, was directed to be cleared out. Labourers were accordingly employed, and, almost choked up by weeds and mud, so little water remained that no person expected to see any fish except a few eels, yet nearly two hundred brace of tench of all sizes and as many perch were found. After the pond was thought to be quite free, under some roots there seemed to be an animal which was conjectured to be an otter. The place was surrounded, and, on opening an entrance among the roots a tench was found of most singular form, having literally assumed the shape of the hole in which, of course, he had for many years been confined. His length from eye to caudal fork was 33 inches, his circumference, almost to the tail, was 27 inches; his weight 11 lb. 9½ oz. The colour was also singular, his belly being that of a charr, or vermilion. This extraordinary fish, after having been inspected by many gentlemen, was carefully put into a pond; and, at the time this account was written, twelve months afterwards, was alive and well."

This is the largest size on record.

Tench are said so be found locally rather than generally. It is unquestionably an English fish, being spread all over the country. It is also found in Holland and all the European lake provinces. 1514 is the date assigned to its introduction to Britain. Ireland does not possess many, and Scotland still less. It seems, as the foregoing episode seems to point out, to thrive best in old pits, muddy lakes and ponds and deep still holes in rivers. The Thames, Mapledurham way, presents some exceptionally beautiful specimens.

The food of tench is, shortly, worms and all water insects, as well as such vegetables as young shoots of water weed, and land vegetables of a similar character to those beloved by his neighbour, *Cyprinus carpio*.

(To be continued.)

THE FISH OF THE TRENT, AND HOW TO CATCH THEM.

PLAIN PAPERS FOR PLAIN ANGLERS.*—No. 6.

By the TRENT OTTER.

THE BARBEL, *continued*.

I MENTIONED in my last, that when the barbel were biting you could catch no dace, and when the dace were feeding you could catch no barbel; "of course, I allude to the two fish in the same swim at the same time." Now I don't want it to be understood, for a moment, that you never catch the two together, for occasionally, dace and barbel are taken together, but I mean it is not a general thing to find the two fish feeding very freely at the same time, and in the same swim. I remember once fishing in a good barbel swim, a short distance above Newark, with an old friend—a very good angler; we had baited the swim properly, and reckoned on a good take of barbel, but that time we had reckoned without our host. Water was right, tackle was right, bait was right; in fact, everything was right, except the barbel, and they were conspicuous by their absence, for not a single barbel did we take, either that day or the next, but nearly every swim we took a dace. Now I supposed there were no barbel in the swim, or else the dace would not have fed so freely, and I have still every reason to believe I was right in my supposition; the barbel were not in the swim, and so the dace held high carnival. And on the other hand, we were again fishing—this time below Newark; and I remember I took a barbel, then a dace, then a flounder, then an eel, then a bream, and then another barbel; but as we only took three dace all day, I should think I shall be right if I say there were not many dace in the swim (and there were not many barbel there either; if there were they would not bite, for we only took six), and if it had not been for a few bream, eels, and flounders, we should have had a very poor show. Now, if you elect to bait your swim with whole worms, and first thing in the morning, the best plan is to take 500 the first morning, 300 the second, and 200 the third, and then go the next day to fish it; and if you could see the fish eager, and waiting for their breakfasts—being used to it for three mornings, they begin to look upon it as a matter of course—I say if you could just see them, you would feel very much inclined to shout, "Three cheers for barbel-fishing"; only remember, don't fish the swim the same day that you give them the last dose of worms, but on the following morning; and also remember what I said before—always cut up and throw two or three dozen in before you put your tackle together.

When I was first initiated into the mysteries of the Trent and its fish, I supposed, as the barbel was a big fish, I should require very powerful tackle to take them. I had for a companion an old

friend with the same opinion; in fact, you may put us down as being very much tyro's just then. We have learned a little since then. Well, as it happened, we had got our ground-bait in all right, "more by good luck than good looking," I must now confess; water very bright; tackle very coarse. My old friend who had a predilection for spectacles had them as usual astride his nose, when, by accident, they fell off and sank to rise no more; but the loss of the spectacles was of no account, for I believe he could see as well without. There we were with coarse tackle in a fine water trying to catch barbel; no go, two small fish in five hours. "There are no barbel in the swim," says my old friend, "let's give it up and go home." "Oh, no," says I, "let's try a little longer. I believe it is all owing to your spectacles that we are getting no barbel, for I believe there are a lot down there, only they keep putting your gig lamps on in turns to examine the bait." The idea of a big barbel with a pair of goggles on was too much for my old friend's risible faculties, for he looked at me and then laughed, drew the cork from the bottle and, as he said "the joke was too good to pass by without wetting," took a good swig. About half-an-hour after another angler came down with his rod and tackle. We explained our difficulty to him. He knew his business; he looked at our worms, they were all right; so, at our invitation, he put his tackle together, and now, for the first time, I saw my mistake. His tackle did not look strong enough to land a paltry six-ounce roach—at least, in my inexperienced eye it did—while his line, I thought, would hardly do to whip hooks on with, so fine was it; but in about an hour eight more good barbel lay on the grass, all killed with his fine pale blue tackle, without losing a single fish; this was rather a severe eye-opener to us, and proved to us by demonstration that fine tackle was decidedly superior to ours. If you make your tackle yourselves, I should recommend you to take a hank of ordinary roach gut, round and smooth-drawn, of a pale blue colour, and make your tackle about 5 feet long. When you use it you will be surprised at its strength, and the ease with which you can kill your barbel. There is also a sort of gut called drawn gut, sold at the tackle shops; it is very fine and very strong. I like a length of it on the bottom of the tackle. Mr. Slater, Newark, makes barbel tackle up with a length of drawn gut on the bottom. I have seen Mr. Rudd, of the Reindeer Inn, use a barbel tackle made entirely of this fine-drawn gut; and with a very light float he has succeeded in making some grand catches of barbel. Once, in particular, I remember he and three visitors were barbel-fishing; he used that sort of tackle, and at nearly every swim he was fast in a barbel, till he had landed a very good catch, whilst his companions could not show a single fin. Some anglers like round-bent hooks, and some like neck-bent ones; now I think a round-bent Carlisle hook is the best, for you can put a worm on it so much nicer than you can on a neck-bent one; a No. 6 is the best size for the bottom, and a No. 8 for the lip-hook. If you bait your swim with the scratchings, potatoes, &c., that I described some time back, your tackle must be similar to the worm tackle; except in the case of the hooks, for you will not want a lip-hook, and instead of having only a single hook on the bottom, two No. 7 or 8 hooks whipped back to back will be found the best. When you have baited your swim with scratchings, you may perhaps catch as many chub as barbel, for it is a bait that a chub is very partial to. If you find it is not possible to fish the swim with a float, then you will have to do what is locally known as plumbing; a bottom-tackle two or three feet long will be quite long enough for this purpose with a few split shots on it; and on the line close to the loop of the tackle put one of the flat triangular-shaped leads known as plumbs on the Trent; this will keep the bait at the bottom; put your bait on the same as for the float-tackle; throw it in; hold the rod in your hand, and you will easily feel when you have a bite.

In No. 3 of my articles, published on February 28th, 1880, the following passage occurs:—"Some anglers let the spring of the rod kill the fish, and don't allow the line to run off the reel, but I should say don't play him where you first hook him, if you can help it; draw him out of the hole, and bring him up stream a few yards, and then he will not disturb the others." Now, when that passage was printed, and I read it, I thought it was hardly satisfactory; some anglers would think I meant a sort of a pulley-haul system, a neck and crop dragging out of the fish; but let me explain. It certainly does look like it at first sight, but it would ruin all the tackle in creation to follow that plan. "Don't play your fish where you first hook him;" so far so good—(a shoal of barbel might perhaps be congregated in a hole of only a few yards square)—if he rolls and tumbles about there he will most likely alarm the rest. When you first hook a barbel, he will at once bolt away; let him go, as far off as he likes, and when he is spent, draw him to you, taking care that he does not bolt into the haunt; and get him as soon as you can directly under the point of the rod, and when he has expended his strength in the first mad rush or two, you can easily persuade him to come under the point of the rod. A very steady pressure will accomplish this, and remember, the further you can keep him away from the others "if you know it," the greater is your chance of success. I am very sorry I did not notice the mistake before I sent the MSS., but I hope our friends will forgive me, and I must be careful in the future. I might just mention that when you are barbel fishing from the bank, and you hook the fish, and he bolts towards the middle of the stream, you may know that it is a barbel; but if he bolts towards the bank he is a chub; I have often found it so. An old friend of mine, when barbel-fishing, after the first mad rush or two of the fish, and when he once begins to wind on him, and gets the float above water, hardly ever allows the float to disappear again, but holds him tight, and lets the spring of the rod kill him. I don't recommend this, but still it is done by that old friend of mine, and he is a very good and successful angler. If your barbel is only a small one, it is perhaps as well to hold him tight; but if he feels heavy don't risk losing fish and tackle by not allowing him to have a little of his own way. The mouth of a barbel is situated very much underneath, and he has some very hard leathery jaws, so if you hook him firmly you need not fear the hook cutting through; a moderately sharpish stroke is necessary to fix the hook well, and when he is once well hooked, the hold very seldom gives way.

(To be continued.)

MERCILESS FISHING.

I AM very glad that my article on "Merciless Fishing," which really means "gross-weight competitions," has called forth a reply from Mr. T. Huggett, and if all correspondents were to write in the same gentlemanly and courteous spirit, there would be some pleasure in conducting a discussion on a subject in which there may be a difference of opinion. I can thoroughly agree with him that on the days of competition for one particular kind of fish, there is a large amount of enthusiasm in the club-room in the evening, to witness the return of the competitors and their show of fish. There is a great deal in his friendly remarks, which are in union with my own views, and one especially, in reference to the sizes of fish adopted by some clubs very far in advance of the Thames standard—particularly in that which relates to barbel. Unfortunately, the great number of angling clubs have not the same regard for the sizes of fish as the Piscatorial Society, of which I know he is a worthy and respected member; and, although a barbel of 2 lb. is the recognised weight instead of a fish of 12 inches from the eye to the end of the tail, a tray full of

such fish—say about a dozen—would receive less admirers than one containing half-a-dozen barbel of 4 lb. and 6 lb. each. I do not think the competition nights would be deprived of much interest if the limit was made to the larger fish—competing members would be more desirous of getting the heavier fish than going where they know a quantity of small ones could be obtained. I was very much pleased the other evening at the dinner of the Richmond Piscatorial Society to find that Major Bull, the vice-president of the Society, gave a large tankard as a prize for three of the largest fish, and it was a remarkable circumstance that three of the members made a tie, and the cup was not won, as there were no conditions—as in a pigeon match—to fish it off. Still, there is the principle recognised of the “largest fish” instead of “gross weights;” and that is the feeling I am anxious to enforce. The rule of the Piscatorial Society, as regards jack of not less than 3 lb., is a very good one, and I should like to see it universally adopted. I have been out with angling members of that excellent Society, who have put back all fish under 3 lb., simply on account of that capital rule; but where is there another club that possesses so high a standard? The West Central Association of London and Provincial Angling Societies requires the clubs affiliated to it to recognise a size of 18 inches, the extreme length of the fish—which would be three inches less on the old plan of measurement from the eye to the end of the tail—as the proper standard. Of course there would be no objection raised against any of those clubs if they adopted a larger size, but it may safely be affirmed that not half-a-dozen go beyond the extreme length of 18 inches, which would only be a good-conditioned fish of 1½ lb., and not more than a pound, out of condition. I have weighed several jack of 1 lb. each, which when out of season weighed only ¾ lb. I am confident Mr. Huggett will agree with me that the adoption of such fish in a gross-weight competition would be nothing more or less than an encouragement to merciless slaughter. In the jack competition of the Piscatorial Society, the competitors have to compete on the Thames; and I do not think, as a rule, anywhere, fish caught in private waters are allowed, except in gross weights for the season, or for specimen fish. I have had a deal of correspondence lately in reference to the “gross weight” question, and all agree with me in the movement I hope I have established, to get the practice abolished; at the same time, I shall be glad to hear the opinions of others who may differ from me, if they will only write in the same courteous strain as that which characterises Mr. T. Huggett’s remarks in the columns of the FISHING GAZETTE last week. I am satisfied of one thing—that, when the principle is recognised, many of those who are against it now will be found hereafter in the ranks of its most able advocates. The angling clubs, through the central associations have done great things already in making a standard of sizes, instead of what there used to be—a gross weight of fish, irrespective of size or of Thames regulations. Whenever the river-keepers in those days came in contact with bank anglers indiscriminately bagging *all* fish, upon an interrogation, they were simply informed, “Their club allowed fish of all sizes to be weighed in as gross weights.” It is not so now, I am thankful to say, and thanks very much to the Central Association for it. It was undoubtedly a move in the right direction, and has done much good. There remains much more to be done; and, in the advocacy of the abolishment of gross weights, I know I am supported by many of our best anglers. It, perhaps, cannot be done all at once, and I would venture to suggest that some few of the clubs should make an example. Let the prize-givers offer prizes for a certain number of the best fish, as in the case of the Richmond Piscatorial Society; it will do more to enforce the principle than all the writing in the world. I shall now leave the question for a time, as I have done before,

in the hope that the seed which is sown will shortly bring forth some fruit; but I cannot conclude without expressing my deep acknowledgments to Mr. Huggett for the sensible and kind remarks he has made as a reply to my article on “Merciless Fishing.”

B.

THE THAMES POACHERS.

A CONVERSATION BETWEEN TWO OF THE BODY, AND SUPPOSED TO HAVE BEEN OVERHEARD AT BRENTFORD.

WISEMAN: I thought we should have had a good turn the other night at Twickenham.

THREESTARS: You mean when that blessed Keepers’ Dinner was going on in London.

WISEMAN: Yes, that’s what I mean; and if it had not been for them confounded blocks of ice we should certainly have done something, or tried for it.

THREESTARS: But, old friend, let me tell you one thing: I heard last year that when that last Keepers’ Dinner was on some one belonging to the Angling Clubs in London, and who is on the Thames Angling Committee, was on the watch with a party, and he has a warrant to act as river-keeper. You know we could not agree that night what to do, and we did nothing.

WISEMAN: That’s all very well, but I think we should have tried hard this year. That keeper they call Walters at Twickenham is always on the look out, and he would have had us the other night if his other mates had turned up. He’s one of those men that will not be bought over, for in that last case he was offered five sovereigns to square it.

THREESTARS: He’s the only fellow I’m afraid of, and he’s already spoilt us of many a little game. Do you know where the fellow came from?

WISEMAN: Well, I’ve heard he’s been on the sea, and them sailor chaps are awkward fellows to deal with. Them blocks of ice beat all the keepers and protects the river from us folks better than they can.

THREESTARS: It must have made Walters scratch his head when it didn’t require it, when he saw us that night stripping the river and he couldn’t get at us. He thought of keeping his being, you know where, a secret, but it was blown to us the very next day.

WISEMAN: I’m told them Richmond Piscatorial folks are now working with the Thames Angling Society and they can make the river very troublesome for us. They had a feed last week, and some of the Thames angling people were there and said they were going to get some of the gentlemen in the neighbourhood to act with their river keeper. We shall have to keep our eyes and ears open, as you know the beaks are all dead against us, and that last affair cost about £30, which is a big sum.

THREESTARS: Well, if they stop us netting the Thames we must go to some of them private waters, for fish we must have, and we’ll have them too.

WISEMAN: You know there is a lot of us in it, and we always have a watch boat in front and one behind, and if we smells a rat we can easily hook it. I never knew the river so full of good fish as it is now—look what them angling chaps here done in getting their 40-lb. weight of fish in the day. They may say what they like, but that Thames Angling Society has never worked so hard to stop us fellows from poaching as it has done the last two or three years. That man of their’s at Twickenham has nipped many a proposed visit of ours in the bud, and poaching is a deuced awkward game now, I can tell you.

THREESTARS: Yes, it was all that fellow’s doings in that last Brentford case, though he did not get the best part of the credit for it. What are you going to do when this frost has gone?

WISEMAN: We shall have another try, although I hear Walters is determined to pull me if he can; but he's got to catch his hare first before he can cook it.

THREESTARS: All right, old fellow; so here's luck, and good night. B.

THAMES STEAM NAVIGATION REGULATION BILL.

The following extracts from the above Bill will be of interest to our readers:—

A BILL FOR THE BETTER REGULATION OF STEAM NAVIGATION ON CERTAIN PORTIONS OF THE RIVER THAMES.

BE it enacted by the Queen's most Excellent Majesty, by and with the advice and consent of the Lords Spiritual and Temporal, and Commons, in this present Parliament assembled, and by the authority of the same, as follows:

2. The following terms shall in this Act have the meanings hereinafter assigned to them; that is to say,

"Steam vessel" shall mean any vessel propelled or constructed to be propelled wholly or partly by steam:

"Conservators" shall mean the Conservators of the River Thames for the time being appointed in pursuance of any Act or Acts of Parliament in that behalf.

"River" shall mean that portion of the River Thames which is within the jurisdiction for the time being of the Conservators between Putney Bridge in the county of Surrey and Cricklade in the county of Wilts.

"Night" shall mean the period between one hour after sunset and one hour before sunrise.

8. Every steam vessel registered under this Act shall have the registered name, letter and number of such steam vessel conspicuously, and to the satisfaction of the Conservators, painted in letters and figures, not less than twelve inches long, upon each side of the bow and also upon the stern, at a height of at least six inches above the water line, and also upon the front of the funnel at the highest point thereof above the hull. Such letters and figures shall be painted white on a black ground or black upon a white ground.

9. Every steam vessel registered under this Act shall, when under way at night, carry the following four lights, viz.: as a head light on or before the foremast, or, if there be no foremast, on a staff at the bow, and also as a tail light on a staff at the stern, at a height in each case above the hull of not less than six feet, a bright white light behind an opal or frosted glass shade or slide, upon which the registered letter or number of such steam vessel shall be legibly and conspicuously painted in black, such letter and figures to be not less than twelve inches long; on the starboard side a green light, and on the port side a red light.

10. No person shall at any time cause or wilfully suffer to be concealed the registered name, letter, or number of any steam vessel, or cause or wilfully suffer to be obstructed any of the said lights.

11. No person using or assisting in using a steam vessel for the purpose of navigating the river shall cause or permit the speed of such steam vessel to exceed the regulated maximum speed of six miles an hour or to exceed one half the above maximum speed at night or in a fog; and every such person shall ease, stop, or reverse the engines of such steam vessel when rounding any point of land and also when approaching or passing any boat or other vessel propelled otherwise than by steam, and navigating or lying in the river, in such manner that neither the speed of such steam vessel nor the wash thereof shall endanger the safety of such boat or other vessel as aforesaid or any person therein, or cause annoyance or inconvenience to any person therein, or undermine, carry

away, or otherwise injure any portion of the soil forming either bank of the river, or injure any of the property or works of the Conservators.

14. Notwithstanding anything herein contained, it shall be lawful for the Conservators, by special licence under their common seal, on the subject to such terms as they may think fit, to authorise any person or persons to navigate any registered or unregistered steam vessel on such part of the river, for such period of time, and at such speed, exceeding or not exceeding the maximum speed herein before authorised, as shall be mentioned in such special licence: Provided that every steam vessel navigating the river by virtue of any special licence shall carry and display a red flag with the word "special" on each side thereof in white letters.

15. Every person committing any breach of or in any way infringing any of the provisions of this Act shall be deemed to have committed an offence against this Act, and shall be liable to be summoned before a magistrate; and shall, upon being convicted of such offence, be liable, subject and without prejudice to section five of this Act, to a penalty and forfeit a sum not exceeding ten pounds; or, as an alternative penalty, to imprisonment with or without hard labour for a period not exceeding six calendar months, and with or without in each alternative the additional penalty of the forfeiture of his licence (if any), and costs.

16. If upon an information laid before a magistrate, it shall appear that an offence has been committed against this Act by any person or persons using or assisting in using any steam vessel for the purpose of navigating the river or being on board any steam vessel, but that such person or persons, or any of them, cannot be discovered or apprehended, the registered owner of such steam vessel shall be liable to be summoned as in this Act provided, and shall, upon proof of the offence having been committed, be liable to the penalty or penalties herein before provided, in addition to any other penalty to which such person or person may be liable by virtue of any law or statute in that behalf, without prejudice to the liability for the said offence of such person or persons as aforesaid, if he or they shall afterwards be discovered and apprehended: Provided that in the event of such person or persons as aforesaid, or any of them, being afterwards convicted of such offence, the magistrate before whom he or they appear may, if he think fit, then or at a subsequent time remit or cause to be remitted, on such terms as he may think fit, any penalty which may have been imposed upon the registered owner under this section, if, in the opinion of such magistrate, such registered owner was not to blame directly or indirectly for the said offence, and had not done or permitted anything whereby information had been withheld as to the person or persons actually guilty of such offence, or whereby the course of justice had been in any way impeded.

FUNGUS IN SALMON.

SOME salmon, recently found dead in the river Lee, Co. Cork, were found to have been attacked with a fungoid disease. To what extent the disease prevails is not yet known, but three or four fish have, up to the present, been picked up; and on these the dark spots which mark the infected parts were plainly visible. One of the salmon was seen struggling on the top of the water, as it was borne down by the current; and, when taken out dead, was found to have this fungus growth on its body. The spots are in appearance resembling a mole, and about the size of a florin. The surface is of a greenish hue, and comes off like a piece of flock. Beneath is a cancerous sore, which eats into the backbone and destroys life. A few years ago the disease appeared among the salmon in the Lee, but at that time it developed itself

late in the season, when angling was practically over. Its presence at this early period, and before the fishing has opened, may be productive of serious injury to the angling prospects of the new year.

ANGLER.

THE FRIENDLY ANGLERS AT DINNER.

THE termination of the calendar year in some of the angling societies in London is made the end of a season as regards the weighing-in of fish and in fishing competitions. But if it finished on the 31st of December, it is only to make a commencement on the day following for another similar period of time. The last day of the year is the day of reckoning, and in the long list of prizes the success or failure of competitors is made out. The accounts of another year are made to close, and all begin afresh on the first opening day of a new year. It is so with the Friendly Anglers, who hold their meetings at the Albion Tavern, Albion Street, Hyde Park; and a famous and spacious club room they possess, with a liberal and genial proprietor who, without let or hindrance, allows them to assemble in his capital hostelry. It is no wonder the "Friendly Anglers," imbued with the right spirit, finding their club room required a fresh doing up, they decided at their own cost to redecorate it, and put it in decent order. This has recently been done. The walls have been covered with a rich crimson paper, the ceiling fresh whitened, and the cornices elaborately embellished. The magnificent collection of preserved specimens of fish, embracing, amongst others, a handsome Thames trout of 10½ lb., some large pike, a remarkably fine perch of 3½ lb., and other good members of the finny tribe, form the adornments of the walls, surmounted with deers' heads and antlers; and with pictures and paintings, together with a ludicrous model of an angler fishing in a water-tub, gives to the splendid room a charming and effective appearance. It was in this room the members and a few invited visitors assembled on the evening of Wednesday, January 25th, for the purpose of sitting down to the annual dinner—covers were laid for fifty, and exactly fifty sat down—and it is remarkable the number exactly corresponds with the limit of members to be enrolled on the books of the society. The hour of six o'clock was the time appointed to serve up the dinner, allowing half-an-hour's grace to "the worthy host," who, true to the time so fixed, was ready in the room waiting the signal of the occupation of the chair to commence operations. The menu was of a substantial character—in a word, of a good English dinner of fish, joints and poultry, with sweets and cheese. Mr. King, the respected proprietor, appears to be a fine example of a genial and worthy host; and if his attention and devotion to the comforts of the guests assembled on this occasion can be received as an evidence of his qualifications, he is richly endowed with the necessary gifts, and, with the assistance of his son combined, left nothing wanting to give perfection to the whole. All being seated, Mr. Mitchell, a thoroughly practical and hard-working angler, judging from his position on the prize list, occupied the post of chairman, with Mr. Bloxham in the vice-chair. Amongst those present were Messrs. Nobbs, Hoblyn, T. Cliff, W. Pain (treasurer), C. M. Le Good (hon. sec.), W. H. Brougham, J. P. Wheeldon, Woodhall, T. R. Sachs, Henderson, Brown, Emanuel, Barwell, Beale, Freeman, Hodgkinson, Berry, Newson, &c. Of the dinner itself too much praise cannot be given, as there was plenty of everything, and everything was exquisitely cooked. It needed not the eye of an epicure to discover the fact that in the oyster sauce which accompanied some first-rate codfish that they were "real natives," and not the tinned substitution. Plenty of time was taken to discuss the good things, and the discussion was perfect and satisfactory. At half-past eight the cloth was quickly removed from each table, and it is understood as the signal to commence smoking—favourite pipes were soon displayed, and the room was quickly filled with what to the smoker is a rich fragrance of clouds of tobacco and cigars, but to the non-smoker, whose numbers are few and far between, the dreaded part of the programme of dinner proceedings. All being charged, and the glasses too, Mr. Mitchell, adopting "brevity as the soul of wit"—and he is not far wrong—simply gives "The Queen, and the rest of the Royal Family." He reserves himself for the higher and more important one—the toast of the evening—"Success to the Friendly Anglers"—which he gives in a thoroughly practical style. He assures those present that the club is growing older, that it is still in good prosperity, and that the members most nobly carry out the designation of the Society—they are in every respect "friendly anglers." Referring to the prize list of last year he remarked that the offer of prizes is one of the largest they have had for some time, but the shows of fish on the meeting nights have been lamentably deficient. He attributes this falling off to the bad sport of the Thames. Those members who have usually brought in such good takes of Thames fish having done very little—both as regards size and quantity. The barbel have been very small, and there has not been a jack heavier than 5 lb. Mr. Mitchell then refers to a movement amongst some of the members to do away with gross-weight competitions and gross-weight prizes; but in this the majority have decided against them, and he, for one, was much in favour of gross weights as giving a great interest to the weekly meetings. After some further business-like observations, he concludes by asking those present to respond to the toast in a hearty manner, his request being complied with amidst great enthusiasm. Mr. C. M. Le Good, the excellent and devoted honorary secretary, takes the opportunity of informing those present that the society has recently increased the standard weights of fish, and that the entrance fee, which has been five shillings, is increased to one guinea.—The Chairman then proceeded to distribute the prizes, and according to

the rules no member can take more than three prizes. Mr. Emanuel, who is an excellent trout-fisher, and who, with Mr. F. Hoblyn, has during the season made some magnificent shows of the spotted beauties, takes no less a sum than £16 18s. Mr. Mitchell, the chairman, comes next with an amount of £9 19s. 6d., he having secured the gross-weight prize of the season. Mr. Howard is credited £8 18s. 6d., and Mr. Hughes with £7 17s. 6d. Then comes Mr. Garrett and Mr. Hunt with four guineas each. Mr. Newson, Mr. C. Calcott and Mr. Hawkins £3 13s. 6d. each; the latter member having won a rod of the value of £2 5s. Mr. F. Hoblyn, Mr. Brown, Mr. Henderson and Mr. Berry three guineas each; Mr. Craggs, two guineas; Mr. Batson, £1 11s. 6d.; and Mr. T. Cliff, Mr. Grant and Mr. Freeman, one guinea each. The amount of prizes offered for competition last year was £118 14s. 6d., of which £98 19s. had been won. The distribution of the prizes created great enthusiasm, and each recipient was warmly applauded. The remainder of the evening was occupied in the usual routine of toasts, responses, and some excellent singing amongst the members. The dinner commencing at a tolerably early hour, there was no necessity to get an extension of time, and at 12 o'clock all that remained were ready to depart in peace to their respective homes. The entire proceedings were regarded to be of a specially interesting character, affording ample proof that amongst the roll of London Angling Clubs none were in a more healthy position or with a better class of true Waltonians than the "Friendly Anglers," and long may they go on prospering and to prosper and yearly increase in wealth and usefulness. There is no fear of this with so active and intelligent a secretary as Mr. C. M. Le Good, and so capital and zealous a treasurer as Mr. W. Pain.

A FIRST EXPERIMENT FISHING FOR BLACK BASS AND PIKE WITH A FLY.

FREMONT, NEB.

I AM glad to see that Dr. Henshall is to continue his *Western Angler* series, as it was reading them which led me to try fly-fishing for black bass. I did not place much faith in fly-fishing, never having seen the fly cast aright; but I fitted out and started for the lakes with a friend whom I could not trust, for I had my doubts about our bass being fooled with a wad of feathers, and before starting I was careful to stow away in my hunting coat pocket my favourite "fluted Skinner," and the usual "bed cord" line which never failed to bring in everything it hooked on to.

We arrived at the lake in due time, and found a gentle breeze, just enough to ruffle the water, yet I had no faith, so after persuading Smithy that I had seen a flock of prairie chickens light in a draw near the head of the lake, he started with dog and gun, and I drew out rod, reel, and line, and fastened to my six-foot leader, a mongrel, made from wood drake feathers and yellow floss, which looked about as much like the usual food of bass as a bull pup. I could see the bass "breaking water" every few minutes, and felt relieved when I thought of my "fluted spoon." I reeled off about eighteen or twenty feet of line, and having "read up" on casting, braced myself in the most approved style, and made the prescribed circle with the rod, and the line also circled around my legs. I verily believe the fly struck a dozen rushes before I could get the line straight, and the hook caught every time.

As it was getting tiresome I stepped into a boat that was lying near and shoved clear of reeds and brush and tried it again; this time with better success, and managed to lay the line out straight, and only about half of it struck the water before the fly, but I was dumfounded to see a rush and break, and away went fly, fish, and the line, whizzing. Such music as that reel made I have never heard before. Fortunately, the fish was so ravenous he had hooked himself, as I never thought to strike, and before I could recover he had about twenty yards of line, and was doing his level best on the last five. I tell you, then, I thumbed that line for dear life, raised my rod, and succeeded in checking him with about six turns of the line on the reel; then he broke and took a survey of the situation, and after three or four minutes running, gave up. He was a fine one, weighing two and a half pounds; but that was only the beginning.

I subsequently took seventeen bass and two pike, one six and the other four and three-quarter pounds; and you may be sure I have never used a spoon since, and it would be just about as interesting with a net as a spoon to me now.—In *Chicago Field*.

W. T. J.

A DOG'S PRESENCE OF MIND.—A story illustrating a dog's presence of mind comes from New Brunswick, N.J. One morning recently, a little brown and white dog, owned by one of the workmen on the Pennsylvania railroad, was playing about the depot. During his gambols he got between the tracks just as the two lightning through trains were approaching, which pass each other directly in front of the depot. The dog apparently saw his danger, for he quickly looked in either direction, and calculated that if he should attempt to cross the track on either side he would certainly be crushed to death. Then he did the only thing which could have saved him—he stretched himself out upon all fours, placed his nose between his paws, and remained in that position until the trains had passed.—*American Paper*.

TO ANGLERS.—W. J. Cummins, Fishing Tackle Maker, Bishop Auckland, is now prepared to forward to anglers his Illustrated Catalogue, which is not only a Trade List but is interspersed with practical hints, useful directions, and valuable information gathered by the river-side from twenty years' experience. The stock consists of his unrivalled Salmon, Trout, Grayling, and Pike Rods, Lines, Reels, Baskets, Artificial Baits, Fly-books, Landing Nets, Gaffs, and last, but not least, his celebrated Trout Flies, which for killing powers stand unequalled. Every article kept in stock is of the very best description.—[ADVT.]

CORRESPONDENCE.

[We do not hold ourselves responsible for opinions expressed by our Correspondents.]

MERCILESS FISHING.

SIR,—Every one interested in the preservation of our rapidly decreasing fresh-water fish is deeply indebted to your able correspondent "B," and Mr. Huggett for bringing the question of "Merciless Fishing" before the public through the medium of your valuable journal.

There can be, I fear, but one opinion amongst Thames anglers generally, that, prolific as the river has always shown itself, there is still a limit to its productiveness, and that, in spite of the indefatigable exertions of the Thames Angling Preservation Society, a good day's sport on our grand old river is now rarely to be met with, even under the most favourable state of the water or the most persistent and judicious baiting.

We have not far to look for the causes: for what with steam-launches; those pests, the swans; and the ever rapidly-increasing number of anglers and angling societies; the river, as well as the fisherman, is "very heavily handicapped."

That competitions are enjoyable most of us will admit, considerable excitement being frequently afforded on the arrival of the several competitors with their small or large takes; yet I venture to assert we should find it equally exciting if the prizes were awarded to members showing either the largest fish or the greatest number over a given weight, which might easily be determined by the committee; and I feel sure the majority of us would rather see a pound perch on our club-room table than a dozen of half the size, or a 2 lb. chub than a corresponding number of pounders. We should also have the additional pleasure of knowing that, at least, those spared would live to propagate the species and afford sport on a future day.

I would also suggest that gentlemen making a big bag of fish, and only caring to retain one or more of the largest, should take care that all they do not want be returned to the river in their presence, and not left to die in the punt's well, or share some equally ignominious fate.

For my part (having fished the Thames for the last 15 years), I confess I always feel more than satisfied if I am so fortunate as to take one or two good-sized fish in a long day's outing, fresh air and exercise fully compensating, in my humble opinion, for any deficiency in the bag.—I am, &c.,

W. H. HARE WINTON.

Wood Street House, Wood Street, near Guildford, Jan. 25, 1881.

MERCILESS FISHING.

SIR,—Referring to the two letters which have appeared in your valuable journal upon the above subject, I cannot think that your correspondent "B" has made angling clubs his special study; my idea is, whether a man goes out with rod or gun his aim is (or should be) to obtain all he can in a fair and sportsmanlike manner. If this is strictly adhered to, and the fish taken are sizeable, I can assure "B" that he has no cause to fear that the river will become denuded of fish.

Members of angling clubs generally despise keeping an undersized fish (except for the purpose of bait). "B" makes barbel a specialité; in the club to which I have the honour to belong, the minimum measurement allowed is 15 inches extreme length, but for specimen fish a much larger one must be attained. I quite agree with Mr. Huggett that the limit for pike and barbel might be increased, but I venture to say that I do not think it would be advantageous to do so in the case of many other fish, as the result would very often be an empty bag and disappointment for the angler.

Referring to prizes for gross weight: it is this which stimulates the angler to extra exertion, so as to obtain a prize, thus keeping up the interest already evinced among the members of the various London and provincial clubs. If this prize is taken from the annual list, I feel sure it would strike a severe blow at the very foundation of angling societies. If the authorities could turn their attention to the banks in the summer part of the season they would find a great number of juvenile anglers who take scores of undersized fish from the Thames in one day. I myself have seen many taken off the distillery at Hammersmith and also at other places. Respecting "B's" idea of ground baiting, I beg to quote our rule relating to it:—"In society matches, if a member be known to ground bait (or cause to be ground baited) any swim or swims before the day named for the competition (unless the conditions of the match allow him to do so), he will be disqualified from all participation in the match."—am, &c.,

VORTEX.

CURATORSHIP OF THE BUCKLAND MUSEUM.

SIR,—I have read Mr. Capel's and Mr. Gosden's letters and fully endorse what they write about the fitness of Mr. Edon as curator of that museum. I have always found him most attentive and obliging and second to none in the science of fish hatching and knowledge of each of the contents of the museum, which are arranged and kept in admirable order. He will give any explanation to questioners, and his ardour is so great that it amounts to what Lord Beaconsfield calls verbosity. He was a great favourite of our late friend Mr. Frank Buckland, he has journeyed with him in the coldest weather to the salmon rivers and waded with him to catch the salmon for procuring their eggs. He is deservedly esteemed by the authorities of the Kensington Museum, and the most unlikely thing to occur would be their parting with him for any one else. The person Mr. Capel alludes to, did bring a memorial of his own concoction to the Piscatorial Society and showed it to me and others. The following week he brought it up to the monthly meeting of the Committee of the Thames Angling Preservation Society, and in answer to questions, he distinctly stated that he had not the slightest desire of interfering with Mr. Edon as curator of the museum.

As an important name was appended to the memorial, several of the Committee, including myself, signed their names underneath, but from what I have since been told I withdraw my name from that memorial.—I am, &c.,

T. R. SACHS.

A PERSONAL MATTER.

SIR,—I regret to find that I must once more trouble you on this "personal matter." The first misquotation to which I referred was not so much using the word parr, where I distinctly said trout, as changing the expression "whole-coloured," to "almost white-coloured,"—a very different thing. To quote "Raven's" own words, there is "at least gross carelessness" here; and note the coolness of "Raven's" attempt to interpret this in a manner to suit his own purposes. As to the other matter referred to, the "Raven" attempts a quibble, trying to confuse the matter under discussion by referring to a confession of mistake I once made, which has not the least connection with the matter re-

ferred to. I acknowledged when I was in error, and am sorry to see that "Raven" has not the moral courage to do the same.

Besides this, the "Raven" accuses me of "purposely using the terms parr and samlet of the same fish," so as not to enable an opponent to know of what he (the opponent?) was writing. The only true part of this sentence is that where my opponent confesses to not knowing of what he was writing: so far from the assertion that I "used the terms samlet and parr of the same fish," being true, the opposite is the fact. I have looked over my letters and only find the word samlet four times; of these, three are quotations from "Raven's" own words, so if there be any ambiguity he has himself to thank. The only other case is in my letter of December 4th, where I say "Raven's letters on the samlet and parr," and in this case there is no ambiguity. Had I committed this dreadful crime I should have had Couch and Yarrell (first edition) as companions under the "Raven's" ban.—I am, &c.,

T. SPENCE.

GERMAN TWINE.

SIR,—Can you, or any of your readers, tell me where I can purchase the German twine? It comes over in 100 yards, different sizes, and is wound on cardboard.—Yours, &c.,

A SUBSCRIBER.

CLUB REPORTS.

AMICABLE BROTHERS' ANGLING SOCIETY.

The general visit. Mr. Medcalf in the chair, faced by Mr. Say in the vice. Mr. Coppock, pianist, from the Clifden Club. Mr. Medcalf opened the evening's harmony by singing "Neapolitaine;" Mr. Say, "The Old Bedstead;" Mr. Wilts, "Out in the Green Fields;" Mr. Hunt, "Louis Renouf;" Mr. J. Killing, "Dear Friends of Old;" Mr. Mitchell, "Never Prove False to Your Friend;" Mr. H. Pinkington, "Tom Bowling;" Mr. High, "Silver Moonlight;" Mr. Cole, "The Maid and the Magpie;" Mr. Phillips, "Black-wall Dock;" Mr. Longdon, "The Anchor Weighed;" Mr. Fowler, Irish song; Mr. Hadkiss, "Paris Exhibition;" Mr. Lack, "The Flying Dutchman" and "The Vagabond." Mr. Bonvoisin addressed the meeting in a very feeling manner with respect to the death of Mr. Foster, Secretary of the Knights of Knightsbridge, whose death occurred while undergoing a very dangerous operation. Mr. Ghurney also addressed the meeting on visit and club matters generally. On the roll call being made 27 clubs responded:—The Alliance, Hoxton Brothers, Great Northern, North Western, City of London, Odds and Evens, Metropolitan, Sir Hugh Myddleton, Convivial, North Eastern, Isaac Walton, Knights of Knightsbridge, Good Intent, Alexandra, Norton Folgate, Hammersmith United, Hearts of Oak, Eustonians, Canonbury, Dalston, Bermondsey, Little Independent, Never Frets, Burdett, Golden Tench, Bridgewater Brothers. The hosts of the following clubs were present:—Hoxton Brothers, Bridgewater, Alexandra, Good Intent, Canonbury, and Bermondsey Brothers. The next visit will go to the Alliance. Mr. Haggatt sang after the roll call, "The Wolf," and "The Lads of the Village;" Mr. Coventry, of the Clifden Club, "The Redskin Hunter;" Mr. Lee, from the same club, gave the "Charge of the Light Brigade;" Mr. Pinkington, "Empress of the Wave;" Mr. Feetchum concluded the entertainment by the "Song of Songs," after which the National Anthem by the company.

J. WORLEDGE.

SONS OF THAMES.

Will the secretary of the above Society be good enough to inform me as to where I shall forward their copy of the FISHING GAZETTE. Paper forwarded last week, returned, marked "gone away, no address." PIXIE.

Jan. 26, 1881.

WALWORTH WALTONIANS.

In consequence of the weather which has prevailed during the last fourteen days, none of the members of the above ventured out, therefore the prizes given for last Sunday's competition, will be added to those given by Mrs. Coleman and the Society, viz., £1 is. and a box of cigars, to be competed for, on Feb. 14, weather permitting. Competitions to follow will take place on the 5th and 10th of March. The first will be for £2 2s., given by Mr. Brown, jun.; £1 is. by Mr. Piolaine, and £1 is. by Mr. Warren. The second for £3 3s., given by Mr. J. Collins; £1 is. by Mr. C. Bansback, and £1 is. by Mr. Parks. Now, "brother Bobs," mend your tackle, so that you do not have to complain of having lost a "big'un" through weak tackle. PIXIE.

Jan. 26, 1881.

WEST CENTRAL ASSOCIATION OF LONDON AND PROVINCIAL ANGLING SOCIETIES.

A special meeting will be held at the Portman Arms, Great Quebec Street, Baker Street, W., on Friday the 4th February, to discuss a new scheme for visiting list, and election of three officers for the same; important discussion in reference to Grand Junction Canal; and distribution of the balance sheet. The best means of rendering assistance to poor George Foster's widow will also be brought forward for discussion. The names of societies represented will be inserted in the reporter's letter to the FISHING GAZETTE. It is important that each society should elect delegates who can and will attend; much valuable information is lost to members because their society is not represented.

Jan. 25.

HEREFORDSHIRE.—To be LET or SOLD, together or separately, a well-built detached HOUSE, containing Dining and Drawing-rooms, Study, six Bed-rooms, Butler's Pantry, Kitchen, &c., Coach-house, two-stalled Stable, and commodious outbuildings, large Garden in excellent condition, and orchard planted with choice table and cider fruit. The lawn skirts the Arrow, a noted trout and grayling river for 80 or 100 yards. Shooting also may be had. Soil gravelly. Five minutes' walk from church. Five miles from the Borough town of Leominster. Two from either Pembroke or Kingsland Railway Station. Also two COTTAGES with gardens, and additional stabling and barn. The premises occupy altogether about two acres. Seven acres additional land may be had if required. Apply to Mr. LLANWARNE, Solicitor, Hereford; or Mr. ELLIOTT, Grecian Chambers, Devereux Court, Temple London.

N O T I C E.

Communications relating to the Literary Department, Fishing Tackle for Notice, Books for Review, &c., must be addressed to the Editor of THE FISHING GAZETTE, No. 12, Fetter Lane, London, E.C. and should reach the office not later than Tuesday morning.

Contributions are solicited, but the Editor will not undertake to return rejected MSS., unless accompanied with a stamped addressed envelope.

Correspondents are requested to write on one side of the paper only and give their real names and addresses, not necessarily as signatures to their letters, but as a guarantee of good faith. Unless this rule be adhered to no notice will be taken of such communications.

THE FISHING GAZETTE is published every Saturday, and can be obtained at Messrs. W. H. Smith and Son's Railway Bookstalls, and of the following, amongst other Fishing Tackle Dealers in London and the Provinces:—

Messrs. Alfred and Son, Moorgate-street.

The Fishing Gazette.

SATURDAY, FEBRUARY 5, 1881.

TROUT FISHING TWO HOURS FROM LONDON.

IN common with a vast majority of my brothers of the angle, I had hoped for a dry and open winter, with plenty of fishing; but, alas! for the frailty of human wishes, such was not to be the case; and we who love our sport so much are constrained to remain

at home with our fishing books and our almanacks, thinking of the coming season and of the many days we hope to spend in fly-fishing, trolling and bottom-fishing, and in reflecting upon the best places where such can be obtained, at some reasonable distance from home.

The 15th of March will soon be here, when we all so well know the Thames fishing will be closed. I will therefore endeavour to point out especially to those of your readers residing in or near London, and who are fond of trout-fishing, some splendid water, where, with hairy line and fly falling like gossamer, some good and well-fed trout may be obtained, running in size from $\frac{1}{2}$ lb. to 3 lb., or perhaps more. I would mention that it is not advisable for the tyro to try the quarters here recommended, or in all probability he will return to his home a vexed and disappointed man. I will therefore at once say that the water to which I refer is at and near the cathedral town of Winchester, only a two hours' run from London; and the fishing belongs to that worthy disciple of Walton, John Hammond, whose residence is well known to the Jehus who attend the railway station with carriages to meet the trains, and who will at once drive the angler to John's house, if so requested. Parenthetically let me tell you that Hammond sells rods and fishing tackle of every description; he maintains his single-handed rods are something wonderful for power, considering how light they are. He once told me he could accommodate me with bed and board; but I mention this in confidence, not knowing if it is his rule or his exception. His house is close by the water side, in fact a stream passes his garden gate, and the enthusiast might, if so inclined, fish from the bedroom window of his house. There is no lack of hotel accommodation at Winchester, either at the Royal Hotel, the George, or the Swan, all of them being about half a mile from the commencement of the fishing. I can speak with confidence of the Royal as being most comfortable, Mrs. Spriggs, the hostess, and Saunders, the head waiter, attending the angler's every wish. It is necessary to take fishing stockings and brogues, or wading trousers and brogues would be preferable, as the meadows are, in many places, soft, especially where the best fishing is. I would advise any who might go to apply to Hammond for the flies they may require; he keeps a good stock—they are of first-rate quality, at very moderate prices. There is plenty of water for a week's stay, or even longer, fishing fresh water each day. In my opinion the best water is the old Barge River, in the College meadows, close to John's house. The fish are there in great abundance; very very, knowing ones they are, too. Some of the College boys practise on this water, and try and try again until they become thoroughly skilled, not only in throwing a long and light line, but in fishing with a *dry fly*—a perfectly upstanding, floating dry fly, looking as much like nature as possible. Only one fly is used here, and for the following reasons.

It must be dry, and floating as above mentioned; and should the angler be fortunate enough to get his hook into one of the larger gentlemen (trout), if he had more than one fly he would get it foul of the weeds, of which there are plenty on the bed of the river; and he would then, in all probability, lose his quarry. It is also absolutely imperative the angler should keep well away from the waterside, for the trout are well-educated, and if they see him whipping and whipping away they absolutely refuse the daintiest and driest fly possible; *ergo*, not only keep away from the bank, but fish up-stream. I have seen this part of the water literally boiling with fish when the natural fly is up, and the visitor will in all probability often be almost alarmed by the desperate splashing made by some of the lusty ones, who nearly all day long, are, here and there, springing and leaping out of the water. The angler can well and profitably devote two days to the College Meadows. The third day he can devote to the water at St. Cross, the bank

nearest the church being the only one belonging to Hammond. After the St. Cross there is a break, and the angler will not be able to commence operations again until he has followed the main road at Twyford for about half a mile. Near the turnpike gate, after having crossed the second bridge, here Hammond's Water again commences, and the fishing continues on the left bank of the Barge River right away to Shawford Bridge, crossing which he can fish from the right bank down the river for another mile at the least. I may here mention, however, that it is not usual to fish down-stream, and the majority of the local men fish up. To do so, a good plan would be to take a fly over to Shawford, between three and four miles, and work from thence, going either down to the bottom of the water and fishing up to Shawford for the fourth day's fishing, returning to Shawford Bridge in the evening, where he can order a fly to fetch him, or walk by the river-side to Winchester. Mrs. Baylis, at the Inn, Shawford, is always both anxious and willing to do all she can to make the angler's visit to this water thoroughly agreeable. She will also provide lunch if ordered, and her charges are moderate. On the fifth and sixth days, Shawford may again be fixed upon as the angler's starting point, there being abundance of water; fishing up for two days, or, for the matter of that, a week's fishing between here and the turnpike-gate before referred to. I have seen some very fine fish in the first lock below Baylis' house, as well as in the first lock on the way back to Winchester, both of which I recommend to be well tried before leaving. I do not consider the water below Shawford so good as that above as some time ago (three or four years, I think) this portion of the river was run dry to allow of repairs to some of the locks. I would in all these matters, however, recommend the visitor to consult with Sergeant Moore (Mr. Hammond's head keeper), who is most attentive, and always ready and willing to give sound practical advice, especially respecting this portion of the river; perhaps he knows it even better than his master. He will show and point out the homes of some good fish—"Some good big shouldered fellows and plenty of them too"; I quote the sergeant's own words here. Should he attend on you, the angler must, on no account, forget his flask filled with potheen for this son of Ould Oireland; it is a good investment. He will tell some good tales, and in all probability put you in the way to find a good fish or two for your basket.

Hammond sells daily and weekly tickets. I forget his charge, but I did not consider it excessive, considering you have miles of really good trout-fishing water. Only one word more and I have done. It is universally admitted that the fly-fisher who can take fish at Winchester can kill trout anywhere, therefore this communication is more especially intended for those who have a fair knowledge of fly-fishing, and I should regret it being the means of misleading an inexperienced amateur, who, in all probability, would catch nothing more than a cold. Trout there are galore. The skill to catch them is all that is required.

THOS. HUGGETT.

NATIONAL FISHERIES EXHIBITION, NORWICH.

DURING the past few weeks, the applications for space from intended exhibitors have been so numerous that the Committee have been compelled to remove the *locus in quo* from St. Andrew's Hall to the Drill Hall—a large and commodious structure; and the City of Norwich Corporation have granted to the Committee leave to erect a large temporary building as an annexe to the above in Chapel Fields Gardens.

We have no doubt this popularity is mainly attributable to the fact of the Government having promised to award the gold, silver, and bronze medals and diplomas of honour to successful exhibi-

tors, and also to the highly attractive character of the general classification and the valuable money prizes offered in the "Special" list.

AMATEUR SEA-FISHING.

(Continued from page 53.)

IT may be well to premise before we enter into the detail of the tackle generally employed in ocean fishing, that it may be classed under the spiller or ledger line, which is moored or fixed to a certain spot, and hand-lines which are used without a rod, either from a boat or cast from the shore. The spiller, likewise called bulter, and of which we give an illustration, is a stout line or cord, usually from 50 to several hundred fathoms in length, with hooks, attached to sneads from a foot to a yard in length. These hooks are placed at intervals, from one to two yards asunder; consequently, many of these lines have two or three hundred, and not unfrequently double or treble that number of hooks attached to them. The spiller, as we have termed it, is differently designated on many parts of our coast. In the neighbourhood of Southampton and the Isle of Wight, it is called a trot; on the coast of Cornwall, a bolter—though the fishermen in the latter place frequently apply that term to such lines only as are used for the larger sorts of fish—as turbot, cod, and ling—and the term spiller to those adapted for smaller fish. And probably lines of this sort are distinguished by many other names on parts of the coast with which we are unacquainted.

These lines, when baited, are sunk, by means of heavy weights, to the bottom, when, after a respite of some hours, they are either hauled on board or under-run, in order to secure the fish that may have been entrapped in the meantime, and for the purpose of being fresh baited. By this mode of fishing, some of the best fish that approach our shores may be taken—as turbot, brill, halibut, and, in fact, every description of flat-fish; as also cod, ling, haddock, hake, bass, conger, whiting, bits, breem, and the whole genus of gurnards, to which we may add John Dorey and surmulet, to say nothing of rays, wraps, monks, and the whole of the shark tribe—a family to whom we must candidly confess we are by no means wellwishers, and would gladly see extinct. Amongst so many fish, both great and small, it necessarily follows that the hooks, tackle, and baits must be proportioned to the size and habits of the fish they are intended to ensnare. But as it would far exceed the limits of this present number to point out the different sized hooks and baits adapted to each particular species, we must, for the present, confine ourselves to the mode of fitting out and laying down a spiller in the way most likely to ensure success. This may be done either in deep or shallow water, but it seems better adapted to a clean bottom than to a foul ground, as the fish most likely to be caught by tackle of this description are not so usually found amongst rocks and weeds, in addition to which the tackle would be greatly endangered in such places. The plan we have adopted in fastening the hooks and sneads to the line is, to have a loop whipped to one end of the sneads and the hooks whipped to the other, which is fixed to the line in the same manner as a bob-fly to a gut bottom in fly-fishing, and which may be put on or removed when requisite, without difficulty. All the fishermen, however, that we have met with, fasten their hooks to the sneads by two half-hitches, which, in addition to its clumsy appearance, renders it quite out of the question, in many instances, to bait the hooks in a proper manner, as, in order to effect this, it is often requisite to run the bait some distance up the sneads, which the two clumsy half-hitches effectually prevent. Most fishermen also prefer having only two strands to the sneads, as, when twisted and kinked by the fish, as they frequently are, it is easier to set them to rights again. We, however, have always used three strands, which not only look

much neater, but are, in fact, much stronger in proportion to their apparent stoutness, as two strands look just as large as three, and are therefore just as likely to scare the fish, who are much more wary of coarse tackle than even fishermen themselves are inclined to give them the credit of. And even with three strands, the kinks may generally be got out when the line is quite dry, and if not, it is only to put on a fresh hook. In many of our rivers and creeks, the small crabs prove a great annoyance in clearing the baits from the hooks as fast as they are laid down, so that catching fish under such circumstances is scarcely possible. The best remedy we know of is to have the sneads double the usual length, and pieces of cork, just big enough to keep the baits from the bottom, fixed about two-thirds of the length of the snead from the line. We must, however, admit that a line fitted out in this manner looks very like a trap, and consequently not very attractive to shy fish; yet in many places it would be utterly useless to lay down lines in the usual manner, as every bait would be eaten off clean in less than five minutes, or else so mauled and mangled that no fish would touch it. Now, supposing your spiller properly fitted out, and yourself being well provided with bait, and full of malice preposse towards the finny-tribe, it must very naturally occur how this line is to be baited and laid down. And there's the rub: for if this is not skilfully done, a tangled line, mangled baits, pricked fingers, and perhaps some expressions—

“ Which grave folks say—
Scare fish away ; ”

will be the consequence—but no fish. Yet, with a small portion of patience and practice, this difficulty may be surmounted. In order to accomplish this, the hooks, when they are attached to the line, should be run on a cleft, which is merely a groove cut in a flat piece of wood about a foot long and two inches deep. The groove must be just wide enough to admit the hooks, which, as they run on, must be placed side by side with the sneads and lead hanging down. In order to be baited, the hooks must be run off the cleft one by one and baited in a wicker basket, such as washer-women use to carry clothes in. To manage this properly, the end of the line next the first hook must be tied slightly to the right-hand handle of the basket, one or two hooks may then be run off the cleft, and the first hook, after being baited, must be placed at the other extremity of the basket, and close to the edge, after which the line must be coiled neatly till you come to the next hook, which having baited, place close to the side of the other, then run off two or three more hooks, and bait and place them in the same manner, taking care to keep the coil clear of the hooks till all the hooks are baited, which being done, fasten the other end of the line to the remaining handle of the basket. At first, the assistance of another person to run the hooks off the cleft is a great advantage, but after a few attempts it may be easily managed alone. If the line is baited on shore—which we would always recommend persons not much accustomed to the sea, to do—care must be taken in carrying the basket on board, where it should be stowed away snug, so that there may be no danger of its being upset or disturbed, which would most probably so entangle your hooks and line as to cause you to lose your labour. The next thing to attend to is to see that you are properly provided with buoys and sinkers. The sinkers should be stones or pieces of iron, sufficiently heavy to keep the line safely moored on the bottom, and without danger of being moved by the current. Two of these sinkers should have buoys attached to them, with a sufficient length of rope to watch at high water. In addition to these, you must have ready two or three other sinkers with straps, either attached to them or the line, so as to be ready when required; and being thus prepared, you may venture forth—that is, wind and weather permitting—to lay down your lines. On approaching the intended ground, get ready your sinkers, and see that your buoy-

ropes are clear, then throw your first buoy overboard, and fasten your line to the sinker, and take care to fix it firmly. Having done this, take your landmarks from the shore, which may enable you to find the same spot again, which might otherwise be attended with some difficulty, as it is not easy to see a small buoy at a considerable distance from a boat, particularly if there is any ripple on the water. Having fixed on proper landmarks, lower the sinker gradually to the bottom by the line, clearing the hooks from the basket as the line goes overboard; when the sinker reaches the bottom, which is easily felt by the line becoming tight, the boat should be gently rowed or sculled along, and the line and hooks, one by one, sent overboard as it proceeds. After 30 or 40 hooks have been shot, it will be proper to attach another sinker to the line, which need not, however, be so heavy as those at the extremity; then lower away as before, and at every 30 or 40 hooks, fix another sinker. When nearly arrived at the other extremity of the line, look out to make fast to the last sinker in time, and as soon as the line becomes tight let it go overboard, still, however, holding on by the buoy rope, and lowering gradually to straighten the line till the sinker touches the bottom, then take up fresh landmarks, and throw over the buoy, and your line is set. After the line has been allowed a sufficient respite, the next consideration is the best way to haul or under-run it. In order to effect this, after having got sight of one of the buoys, get forward in the bow of the boat, and having got hold of the buoy, haul away by the buoy-rope till the sinker is on board, then haul the line on board and coil it away as neat as you can in the basket, unhooking the fish as they come on board. Be prepared with a gaff-hook to gaff any fish that may be too large to be hauled on board by the sneads; and also with a knife to cut out the hook if necessary. Some care is requisite in hauling the line, for if not well stowed in the basket it is very apt to get entangled and cause a considerable degree of trouble to clear it. If it is intended to bait the line again directly, it should be turned out of the basket by turning it bottom-upwards, when the hooks, unless the line has been hauled very clumsily, may be easily cleared from the line and fresh baited, and placed in the basket in the same manner as when run off the cleft. In many instances it may be advisable to under-run instead of hauling the line on board, which is managed in the following manner:—The sinker, and about nine or ten hooks, must be hauled on board, and the fish, if any, unhooked; and the hooks being fresh baited, must be lowered again to the bottom. The boat must then be moved along gently in the direction of the line, which must be run along the gun-wale, and the fish taken off, and the hooks fresh baited, as it proceeds. When you arrive at the other extremity pull a little ahead to straighten the line, which, when you feel tight, let the sinker overboard, holding on by the buoy-rope till it reaches the bottom, in the same manner as you would in setting the line. When the line is brought on shore the hooks should be immediately run upon the cleft, and the line hung up to dry, for if left damp any time, particularly in warm weather, it will soon become rotten. In addition to what we have already mentioned, you should be provided with a creeper for the purpose of recovering the line, in case, by any accident, the buoys should not watch, which sometimes happens through weeds getting foul of the buoy-ropes. But if your landmarks are well taken up by throwing your creeper overboard and rowing gently across the spot where the lines are, you will be sure to find them. Indeed, in some places where the fishermen are more numerous than honest, it seems more safe to trust to this plan than to use a buoy, lest some of those worthy gentlemen, *i.e.*, gallows worthies, might, on seeing the buoys, mistake yours for their own; and our experience has taught us that there are some parts of our coasts where the natives, although sharp

enough in other respects, are very apt to mistake other people's property for their own. And now we have troubled our readers with what we fear rather a tedious account of setting spillers, in deep water, we must still venture to intrude further on their patience some observations on laying them down in shallow water—a method which may perhaps suit many, who, though very fond of fish, will not trust their precious carcasses to the fickle and unstable element, or encounter the pains and penalties of sea-sickness for the purpose of catching them. Spillers may be used in shallow water either in banking or dredging. Banking is where the line when baited is moored to heavy stones on a beach when the tide is out, which, having flowed over it, is visited as the tide recedes. In dredging, a line of about fifty fathoms, and with about the same number of hooks, is laid down at the very edge of low-water mark with a stone sufficiently heavy at the end next the water to keep the surf from washing it ashore, but still not so heavy but that it may be drawn along the sand. To the dredge line is attached spare line of from fifty to two hundred fathoms in length, which is wound on a square reel and held in the hand or secured to the shore. This line is unwound as the tide approaches, the fishermen standing just at the edge of the waves, until the whole of the spare line is out, when the dredge is drawn gradually nearer the shore, by which means the fishing may be continued till high water. On this subject, however, we shall treat more largely when we come to the subject of bass fishing—this being by far the best way of catching fish of that description. But turbot, rays, flounders and congers are also caught in this manner; and we are rather surprised that these two modes of fishing are not more practised, as the best time to expect success is when the sea is agitated by a strong gale, and too rough to venture to sea. Fishing of this kind is, however, better adapted to an open sandy beach than to rivers or creeks, although in the latter we have frequently set them with considerable success; and a friend of ours succeeded beyond his most sanguine expectations with a dredge in the Truro river, opposite Mopas Passage, very much to his own satisfaction and the astonishment of the natives, who had never before seen such a plan adopted. The way in which our friend managed was to carry the outer end of the line with a sinker attached to it, about sixty yards from the bank, by means of a boat, and the other end was held in the hand until a bite was felt, when the fish, if secured, was hauled on shore, and the line again carried out as before. A curious method of setting lines of this description seems to have been adopted on the north coast of Cornwall, where the want of harbours denies a safe shelter for fishing boats. This was by means of a lester cock, a curious sort of machine, consisting of two flat pieces of wood about three feet long and four inches wide, made in the form of a cross. At each of the two extremities of the cross two masts are fixed with a sail between them; one end of the line is fastened to another extremity, by which this machine is kept steady, and is by the wind carried from the shore into deep water. This method of fishing is now, however, become nearly obsolete; but we have met two or three fishermen who have used it, and, as they stated, with considerable success, upon the strength of which we had one fitted up for our own use, but we must confess we never tried it. We believe that in fresh water this machine is termed the “otter,” and is looked upon askance by the fair sportsman.

CREEL.

(To be continued.)

SHETLAND AS AN ANGLING RESORT.—II.

TOWARDS the end of our notice of the Wiesdale district we mentioned two burns which cross the road to the west of that place, and which we should perhaps have noticed in that

connection had it not seemed that they would more naturally fall to be mentioned in describing the road to Walls. Leaving Wiesdale by this road, there is no fear of missing the way, as there is but one. We set a stout heart to the “stae brae” which separates Wiesdale from Tresta Valley, and on reaching the top have two splendid views, both east and west. With the former our wayfarer has already become acquainted from a different point of view, but it merits another look; that to the west give a fine view of the Brouster and Clouster hills with a fine lake-like voe, the Effirth Voe, in the foreground. The road skirts the northern margin of this basin for the next four or five miles, and we have occasionally taken small sea-trout, with an occasional burn-trout, by casting from the side; but this is a feat not often to be accomplished, though from a boat larger sea-trout might perhaps be taken either by trolling a minnow or with fly; we say perhaps, because in one voe sea-trout will rise freely to the fly, whilst in another, containing quite as many fish, they have never been known to do so. About four miles from Wiesdale Bridge the burn of Toomlin crosses the road—this burn, like that of Wiesdale, has no lochs connected with it, and consequently soon becomes small. We have never been able to find any sea-trout in it when low, but when enlarged, which is only for a very short time after rain, there are plenty of small and moderate-sized sea-trout to be taken in it, and we are told that in heavy “spates” heavy fish are to be had. The Shetlanders have a way of dividing sea-trout according to their size, which is sometimes convenient; they call small fish of the size known in Scotland as finnock, “herring,” and sometimes “peltock trout;” the small-sized run of sea-trout—adult fish on their second visit to their native stream—“haddock trout”; these fish will weigh usually from 1 to 2 lb.; the larger fish are called “cod trout.” Taking this division as a guide, we should say that there are about equal numbers of the first two sets to be taken in this stream. There are a few houses near here in which it might, perhaps, be possible to get lodgings, and if this could be done it would be a very convenient locality from which to fish many of the lochs to the west of Wiesdale, mentioned in our last, and some of those of which we shall soon have to speak. Besides this, there is a burn on the other side of the Effirth Voe, bearing the significant name of Laxaburn (*lax* is Norse for salmon), which is quite inaccessible from either Wiesdale or Walls, as also some lochs, of which no one seems to know anything.

About a mile farther on, we fall in with another, but smaller, burn, which seems to hold a few good common trout; at least, we have taken such where it crosses the road, and only last autumn took a lanky specimen of the common trout, which had it been in good condition would have weighed about 4 lb. we suppose, as it measured 23 inches long nearly; what its actual weight might be we do not know, as so far as we are aware it may still be enjoying itself in the stream. We are told it contains sea-trout sometimes. About a mile and a half further west, we reach the first loch of a series which, united by a good-sized burn, extends almost across the island, discharging into Uenyifirth, pronounced Onafirth, Voe. This water, called Hulma-Lees, has a length of about a mile and a half, and is studded with small islands, called in Shetland holms, whence, we suppose, its name. It lies for fully two-thirds of its length by the side of the road, and holds common and sea-trout. The loch-trout are of about the usual size, viz., three to the pound; and the sea-trout are generally from 2 lb. to 3 lb. When there has been much rain this loch is probably the best of the chain, as, though there are two lochs above it, one of them, Tordale Water, of considerable size, sea-trout do not run into them, except, perhaps, in the spawning season. Hulma-Lees discharges itself by a short burn into Grassawater, a lake of very similar appearance and dimensions. This is a good sea-trout

loch, but, owing to the irregularity of its bottom, which is every now and then either raised into a sub-lacustrine table-land, or sunk into deep pits, a difficult water to fish. In fact, though it contains the most beautiful sea-trout of any round Walls, we for a long time wasted our time on it without adequate result, but now that we know it we feel inclined to place it second only to the next loch of this series—Culyerin. This loch is connected with Grassawater by a very short run, and is a small irregularly shaped pond, not three-quarters of a mile round. As, however, it is the first loch of pure fresh water which the fish meet in their run, it is much patronised by sea-trout, which run up to a good size. We once took a rise, —no, not one but three rises—out of a big brown monster here. The last rise was almost at our feet so there was every opportunity to note his dimensions, and we then estimated him at about fifteen pounds. As, however, he was not caught, this is fisherman's weight. The largest we ever took was four pounds, but we have known larger. And here let us remark that all weights given here are actual avoirdupois, not fisherman's weight. This tarn, with Grassawater, holds, besides common trout, a moderate-sized variety of *salmon ferax*; but as no one, so far as we are aware, has ever trolled for them, for the same reason as the cherubs in the Ingoldsby Legends didn't sit down—that there is not *de quoi*, meaning that there is no boat—we cannot say whether there are any large ones to be had. There are, however, at times a few of from one and a half to two and a half pounds to be taken with fly, and we have a very pretty specimen in our collection of two pounds and a quarter in weight.

We had almost forgotten to mention that into the south side of Grassawater, and about the middle, a small burn flows, which comes, after a very rough-and-tumble course down the sides of Brouster Hill, from two lochs situated on the very top of that hill. When full they become one, and in dry weather are only divided by a narrow spit of gravel; but the quality of the trout in them is very different. Those in the southern division are as red as salmon in their flesh; these in the northern and rockier division are black and poor. These twins are called Hylawaters. Returning to Culyerin we follow the burn which runs from it seawards for about a quarter of a mile, when we come to a sea-loch called the Vadels of Henyifirth. This is at times a famous locality for sea-trout, and as it contains a fair admixture of fresh water, those fish rise freely under favourable circumstances, especially when the tide is beginning to flow into it. As it is very shallow in proportion to its size it is no difficult matter to find the lies of the fish. Of course, such a loch is not always good, but during a spell of dry weather—and more especially when rain is at hand—it is the likeliest place for sport near here. It also contains a few loch-trout. A loch containing only loch-trout discharges into the farther side by a small burn, but scarcely deserves mention as there are many better waters in more accessible situations. We may briefly put the state of matters as regards sea-trout fishing in these lochs thus: in dry weather or before rain the Vadels are far the best; after a single spate or moderately wet weather, Culyerin is best, Grassawater a bad second, the rest nowhere: after a succession of spates Grassawater, and later in the season Hulma Lees. To prevent disappointment we must, however, mention that there is said to be a good deal of netting in the Vadels and head of Unyifirth Voe.

About half a mile north-east of the loch which we mentioned as discharging into the Vadels, lie a couple of lochs called Clenswaters, of which the upper and larger contains good common trout. These discharge into South Gloucester Voe, and are separated from Gloucester loch by a barren rocky ridge about a mile broad. On a hill to the east of Grassawater loch lie the ruins of what must have been a very considerable Pictish fort.

AN AFTER-DINNER REVERIE.

IT is winter now, and as I sit in my comfortable arm-chair before the cheerful fire of blazing logs, and watch the snow being whirled and drifted by the fierce gusts against the window-panes, I know my favourite pastime is put a stop to for some time to come; and as I turn, with a shiver, to the glowing fire, and sit, half-waking, half-dreaming, what a flood of recollections of sport in past seasons come back to me!—even my first fishing-rod and my first day's fishing for minnows, and then my first capture of a gigantic perch, some 6 inches in length, comes as vividly before me as if it was but yesterday, although it is now thirty odd years ago. How many a jolly companion since then has made his last cast, and started on the long unknown journey from which there is no return, and which we shall all, sooner or later, have to travel!

What fun we had as boys when home for the holidays, spending the summer days fishing in the marl-pits for carp and tench, catching sometimes as many as 60 or 70 in a day; and then, later on, when fully equipped with fly-rod and all the necessary appurtenances thereto, wandering by the sparkling streams, what varied experiences and what queer little incidents have occurred! How well I remember catching the big trout, whose home was beneath the overhanging willow pollard!—how he sucked in the little “iron blue” which I had dropped just above him!—with what a rush he made off up the stream when he felt the cold steel, and when forced to succumb, he came floating down the stream. My good wife that is now, in her eagerness to net him, missed her footing and tumbled into the pool. Although I had then lost my heart, I did not lose my head, but holding the rod in one hand I dragged my sweetheart up the river-bank with the other, and then landed my fish, which was upwards of 2 lb.

My recollections now carry me away to a little seaside town in Devonshire, situated near the mouth of the river Axe. I know few pleasanter places wherein to spend a fortnight in the hot days of July or August, whether it be sauntering along the rugged cliffs to Branscombe Head, towering hundreds of feet above the ever restless sea, with its cluster of fishermen's cottages nestling in the valley below, and its tiny trout-stream, which here loses itself in the mighty ocean; watching the fishing-smacks from Beer tacking in the offing, and the stately outward-bound vessels speeding under a cloud of canvas down the Channel; or spending the summer evenings with salmon-rod and tackle, and a large white fly, fishing for bass at Axemouth. Rare good sport have I had, too, after the pollack, amongst the rocks by the Landslip, and sailing after the mackerel in the open bay. Ah! Devonshire is a lovely county for the fisherman, with its narrow fern-clad lanes its pretty hills and dales, and ever-attendant babbling streams, well stocked with game and handsome trout.

My mind now wanders to the sister county of Dorset, where, on a day last season, with a brother angler and attendant boatman, we were being gently rowed over a noble lake in one of the finest parks in the county. The ruins of an old castle overshadow the water on one side, a stately mansion, with its well-kept lawns and pleasure-grounds bound us on the other. We had ample time to take in all the beauties of the scene, for the lake was as smooth as a mirror, and the cunning jack refused to accept the most tempting baits. By and by a breeze sprang up, and ruffled its hitherto placid surface. Then was our time for action, and while it lasted what fine sport we had!—killing nine good fish, besides returning to the water all under 3 lb. weight.

The cheerful voices and merry laughter of half-a-dozen youngsters, and the pattering of as many pairs of feet along the passage towards my sanctum, drive away all further soliloquising.

RIVER REPORTS

MID-THAMES.

"The thorny point
Of bare distress hath ta'en from me the show
Of smooth civility." —SHAKESPEARE.

"First it blew, then it snowed, and then it thawed. Then it blew, then it snowed, and then it froze again." This is about as true a description as I can give of the past three weeks' weather, so I trust you will, Mr. Editor, forgive the above quotation, as, in consequence of either the "snow" or the "thaw" or some incivility on somebody's part, you have not inserted my two last Mid-Thames reports. Fortunately, I have little of import to communicate, for angling has been a dead letter for some three or four weeks in consequence of the adverse state of the elements. As I write, the river has, in consequence of the thaw, jumped up into a plethoric fit; nothing can confine it to its bed—in short, it has been and will be for weeks a wandering *aqua-ae*. Fishing is altogether impracticable. Before the thaw, at Henley, some decent perch and chub were had, and at Marlow a piscator with Hatch got some splendid perch, the best scaling 2 lb., also some good chub, largest going 4 lb. Thursday evening.—River in high flood, and full of snow broth and floating ice.—MARLOW BUZZ.

Thames (Goring).

A flood will take a week to get the water in order again if it keeps fine. Water going down, but very slow. Prospects look bad at present for much more fishing this season, unless we get better weather.—J. RUSH.

Thames (Richmond).

The snow and ice have gone off the land, but we have got it in the river now in the shape of a flood—the river stands bank-high at low water. Those who took the opportunity to have a day's fishing before the snow-water got in the river had some good sport here. Bank anglers have caught a fair lot of dace in the eddies since the water has been high. It will be some time yet before we have the water low enough to have a good day's sport, if we have one at all this season.—JOHN BUSHNELL.

Thames (Twickenham).

Since writing last week I am pleased to say the snow has entirely disappeared, but of course angling is quite out of the question at present. We have had some very high tides this week, and with the immense quantity of land water coming down from up the river we have had quite a sea. I am pleased to say we have not heard of a single accident to any person or craft through the breaking up of the ice. Mr. Anderson, of the Island Hotel, taking the precaution by employing a number of watermen to break the ice around his well-known yacht, the "Red Cross Knight," and bringing it safe into dock, or otherwise it might have taken a moonlight trip, which might have ended in a watery grave.—ALFRED PERRIN.

P.S.—I am sorry to say that poor James Brand, better known as the "Veteran," has been confined to his bedroom for several weeks through a severe illness. Brand's character as a true fisherman is better known to my numerous customers than I can pen it. Any small subscriptions will be thankfully received by A. Perrin, Two Sawyers, Twickenham, for J. Brand.

Bure.

All angling has been put a stop to here during the past few weeks owing to the frozen state of both river and road. A. J. N. Chamberlin, Esq., writes "that (Feb. 2) the broad is still safe, and the ice in good condition for skaters," this is a proof of the "Arctic nature" of the recent weather. We saw an energetic angler breaking holes in the ice on the broad the other day, vainly trying to tempt a pike; but the frost was so sharp, his lines were frozen like sticks in a few seconds.—ANGLER.

Devon (Ilfracombe).

Very little doing in sea fishing at Ilfracombe lately, the weather being so cold and stormy. Fishermen have had no chance of working their tides properly. I believe there is plenty of fish on the coast, for when the boats put out for an hour or so they returned with good catches, considering the time out, some nice catches of codlin, pollock, pout, dabs, &c., have been taken from the pier and adjoining rocks this week by hand-lines. Large shoals of porpoises have made their appearance on the coast, and on Sunday last they came on the outer pier and amused hundreds of spectators by jumping out of the water, turning summersaults, &c., for an hour or two, when they disappeared in deep water.—HENRY COMER.

Dove (Derbyshire).

Trout in this river are pretty forward, though angling will not become general for several weeks. A gentleman, minnow fishing near Mayfield last Tuesday, caught several, well over spawning; but, of course, they were promptly returned to the river. Chub have been biting fairly well during this week in the still depths, but angling operations have been much interfered with by ice in the water. However, all of it has now disappeared, and we think plenty of sport will be enjoyed next week, not only amongst chub, but grayling, bream, perch, dace and roach. The best catch we know of this week is one of 14 lb. of chub and barbel. These were taken with cow's brains, near Clownholme. There are plenty of salmon in the river, and prospects in this respect are first-rate. By the way, Mr. Worthington has resigned the honorary secretaryship of the Trent Fishery Board, on account of bad health. The Dove is a tributary of the Trent. South-country readers may not all be aware of that fact, and therefore we mention it.—THE SPLODGER.

Exe and Canal (Exeter).

An "empty shell" really, as far as sporting in the shape of angling is concerned, and to all appearances there will not be for some time to come. The

intelligence from all quarters is still, "Frozen out," although the thaw has been moderately sharp, and the river has already carried down the majority of the ice below bridge; but, then, we have an immense quantity of snow still upon the hills, and if anything, to make it more tantalising, a very sharp frost has again set in, therefore it does not look very tempting, and should say it will take four or five days longer to reduce the river into fishing order let the thaw still continue. The fishermen's list of slaughtered will be a small one for this month, not having seen a single pike, perch or tench since the 15th, as reported in the FISHING GAZETTE "River Reports." Several fresh-run salmon have been seen, about 8 lb. each, going up, and during the breaking-up of the ice several retts were seen going back in the heavy snow water. This looks well, but I am sorry to say that news has reached me with regard to salmon having been taken from the Exe and other rivers during the last month in the tideway. I hear of one person having one of 14 lb., and another as having had a piece of 4 lb. weight sent in from the country. Will exertions be made to put these illegal proceedings down, or must this nefarious practice drop down to a business pure and simple, and confined to a class of men who openly defy the law. The prospect of the future is a very cheery one; but if the frost continues the silver beauties will soon have the benefit of the rodsters, whose close time expires this day, the 31st of January, viz., for the Exe, and I wish them every success, last season being a very indifferent one; and as there is nothing stirring, not even the weather glass, I will conclude, but if it would only move upwards there would soon be some hope for us, but until it does all anglers will feel with me, and like Othello, that our occupation's gone. Wind S.S.W. during the day, shifting eastwards; bright starlight sky.—FRANK GOSDEN, Exeter.

Lee (Co. Cork).

The rain has returned and come down plentifully, and the river has been flooded during the last two days. Spring salmon have been seen passing up in considerable quantities, but they have been very much interfered with by poachers, who take the fish by gaffs as they run on the weirs. The weather continues unsettled, and should the water continue high, there may be a reasonable prospect of good sport in the opening. The Blackwater opened on the 1st inst., and the weather was favourable for the nets. Very little angling has, however, been done, as the river has not been in a fishable condition, and probably will not for a few days longer.—ANGLER.

Trent (Alrewas).

No angling news of any description has reached me from any of our rivers in the Midlands; the water has been in such an unsettled and muddy state in this locality that angling has been completely out of the question. The prospect at the time of writing is very far from inviting. Heavy rain has fallen to-day (Thursday), which will not improve matters. A worse season for pike-fishing in the Trent has not been experienced for years. The weather is remarkably mild, and with the rivers of a more settled character, roach and dace will be sure to feed freely, and the small cockspur worm will prove the most successful lure.—JAS. GREGORY.

Trent (Newark).

Owing to the rapid break-up of the frost, our river has been all the week in a state of flood; and nothing much has been done in the way of angling. A few dace and an odd roach or two have been taken by one or two of the most fortunate anglers, but nothing worth mentioning. Rain fell very heavily several hours yesterday, which will not improve matters. In fact, the water is now rising, and a very nasty colour; so the prospect for the next few days does not look very promising. The weather, at the time of writing, looks very unsettled, raining at intervals during the day, with a mild south wind. Thursday night.—Water still rising, and nearly as yellow as mustard. Every appearance of a heavy flood. Will be a few days yet before it will be in anything like form for worm-fishing.—THE TRENT OTTER.

Wye and Derwent (Derbyshire).

The weather opened the beginning of the week beautifully fine and mild, which caused a good many anglers to turn out on the Derwent both on Monday and Tuesday, trying their hands with both worms and gentles; and I am pleased to say that there were some decent catches of grayling, roach, and dace killed, the branding worms killing the most of the fish. Since Tuesday we have had a good deal of both snow and rain fall, which has caused both rivers to rise considerably. To-day (Thursday) has quite knocked angling on the head for a short time. According to the Fresh-water Fisheries Act, trout are allowed to be taken after the 1st of this month, and if advantage is only made at the proper time, I have no doubt but that the angler will be well rewarded for his trouble, that is, where there is a good store of fish in the rivers, as the trout generally takes the worm most greedily at this season of the year. While the sun was out shining last Monday, I saw a great quantity of flies out in the water—viz., the long fleet-winged browns, also the old cock-wing duns, which some anglers call the hare's ear dun. The brown fly is the first and earliest fly that appears on any of our Derbyshire streams; it is called by some anglers the "red fly." The body of this fly is very much like the alder, only rather more claret and not so thick; wings from the hen pheasant. There are a great many flies now made that take well for this fly. For instance, the March brown, the partridge rump-hackle, dressed with yellow silk, with a small portion of hare's ear, spun sparingly; wren-tail fly, with the same body, or honey-dun hackle; forelegs ribbed with and without gold twist, and the hen-pheasant's winging. I myself seldom ever use it, as I find other flies a great deal more killing. I heartily wish all anglers a better fishing season this year than the last one was. Angling prospects not very encouraging for next week, only with bottom, as there has been a great deal more rain fall to-day (Thursday).—GEORGE JAMES EATON.

Yare (Norwich).

Nothing yet has been done here of any account owing to the swollen state of the river. Mr. Harper, of the Buck Inn, Thorpe, had a fine take of roach this week on the small broad near Thorpe Gardens. This, in such rough weather, augurs well for the future. The pike fishing match of the East Anglian Piscatorial Society which should have taken place last week, has been postponed owing to the severe weather, and the thickness of the water.—ANGLER.

Yore (Yorkshire).

After I had sent my last week's report there appeared unmistakeable signs of a general break up of the frost, and by the time that it appeared in print both the Yore and the Wharfe were in full flood. After a very severe frost, such as we have just experienced, it is a grand sight to stand near one of the numerous weirs on the Yore, or on one of the bridges and watch the large masses of ice come sailing down stream, and when they reach the summit of a weir, rise one above another and go crashing down below. I have been told that higher up the river, where there is a large fall of water named Aysgarth Force, the effect is finer still, but I have never had the good fortune to be there during a break up of the frost.—FRANCIS M. WALBRAN.

THE FISH OF THE TRENT, AND HOW TO CATCH THEM.

PLAIN PAPERS FOR PLAIN ANGLERS.*—No. 7.

By the TRENT OTTER.

THE BARBEL, *continued*.

TIGHT corking is a plan that is adopted by many barbel fishers on the Trent. For this style a cork float, a trifle larger than the one you use for traveller fishing, is the best; only adjust it so that the bait lies well on the bottom, say about two feet deeper. The bait is thrown in and allowed to swim down as far away from you as you think requisite; it is then held stationary, and you can tell at once, by the bobbing of the float, when a barbel attacks the bait. This plan is chiefly used if the swim is a deep hole or eddy not far from the bank. I like the plan under these circumstances, but as a general rule I prefer to fish with a traveller float, so as to let the bait be always moving about all over the swim, or where the ground bait is.

And now I must say a few words about the water. If the water is low and bright, you will find the barbel in the deepest water as a rule, but if, on the other hand, the water is high and very much discoloured, you will find them on the shallows, for they, like pigs, like to root amongst the sand on the bottom. I remember only last year that one of the night-line party set their lines during a fresh on the shallows below Winthorp, and for two or three nights, while the water was up, they had some very nice catches of barbel; but as soon as the water went down they ceased catching barbel there, for the fish had retired into the deep holes. During a fresh in August or September, some good barbel are often taken by ledgering or plumbing, as I mentioned in my last, on the shallows; you cut up and throw a few worms in and bait your hook as mentioned before, and work the bait "all over the shop" as well as you can. If there are any barbel there they will soon take it, for they are roving about in search of food, and if you fail to get a bite, then shift to another place and try again. An old friend of mine, Tom Bentley, a very good fisherman, told me some time back that he had instructed a friend of his to bait a barbel-swim with worms, some few years back. He said he expected he had done it to his instructions; but judge of his disgust, when they went to fish it, to find that, instead of throwing the worms in the hole, where there were 10 or 12 feet of water, he had thrown them in so that they worked into a bit of an eddy, where there was, on ordinary occasions, about 4 feet; but then there had been a lot of rain for a few days before, and the water was just rising, and, as Tom said, it was the luckiest chance in the world (as it afterwards turned out) that the bait was put in where it was. He said the water rose a yard during the day, and at night they had one of the best catches of barbel he ever saw. They had two big baskets with them, and they were both full, as much as they could both carry home; whereas, he said, if the bait had been put in the hole, ten to one if they would have caught a single fish. He said he was sorry when he first went down, and found where the ground-bait was; but before night his sorrow was turned to rejoicing. I have always found that just when the water is rising you can catch barbel, for they then begin to work about in search of food; but it is no good to bait a swim during a fresh. A few worms cut up and thrown in is quite sufficient; and, remember, the first day the water comes on is worth all the rest of the time it is up, put together.

At the beginning of the barbel-fishing season, say about the middle of July, cad bait is a first-rate bait for barbel. These curious-looking grubs are called caddis-worms, that are found close to the sides on the bottom of a river, sticking to the stones,

on the bottom side, next the bottom of the stream. I have found these grubs in the Trent from May to August, and sometimes odd ones in September. If you see a lot of stones in the water carefully pull one or two of them up, and as carefully turn them over, and on the bottom of the stone you will see something that looks like anything except a grub; but what you do see is their outside shell or covering. This covering is about an inch long, and a quarter of an inch thick; it is composed of very minute pebbles and shells on the outside, while the inside looks to me to be composed of sand and slime from the insect. The shell is rounded off at each end; and now, when you have gathered a quantity of these things, they are ready for use at once—the sooner the better—for they become soft and flabby if they are kept any time. Some anglers just put them in a vessel with some water, and change the water two or three times a day; they are under the impression that they will keep a day or two treated in this way; I have tried it, but they always become soft after the first day. Now I have tried several dodges to keep them in good order, and I find that the simplest way is the best, that is—hanging them up in a bag in a cool place; I have left them hanging for a week, till the outside shell was real hard and dry, but the grub was very little the worse, a trifle smaller, perhaps, if anything. I have also kept them in damp moss, and it is a very good plan to keep them good for a few days; but the best of all is to use them as you gather them, if it is possible, for I believe the fresher they are, the better. When you use them for bait, carefully open one end of the shell and draw the grub out; a good one is a bright yellow colour with a black head. I have seen some of them taken from the Trent that have been larger than wasp-grubs; some of them are a dark colour, and some green—these are useless for the hook; as I said before, the yellow ones are the best; they are the larvæ of various water-flies, and are rather tender, so that you must be careful in putting them on the hook. These are a grand bait for all sorts of fish, two of them on a No. 7 or 8 hook is a bait that a barbel cannot resist. Rove about, and drop them in all likely looking spots, and if the fish are on the feed, you will not only take barbel, but chub, dace, roach, &c.; in fact, some grand bags of all sorts of fish have been taken by this bait; barbel will bite at them freely in the month of July, and in such places as weir holes, old bridges, by the side of old walls, or piles, or any retired nook of any sort, provided there is four feet of water or more in the swim. I have heard of all sorts of fancy baits being used for barbel, but I have never tried them. I have tried faithfully to give you the plans used on the Trent; if I have succeeded in making myself understood, I shall be repaid, and if some brother tryo has been instructed by my simple directions, I shall be doubly repaid; but if some do not feel quite clear upon any point, I shall be only too happy to answer them to the best of my ability, either through the columns of the "GAZETTE," or privately. Anyone may have my name and address by writing to the office of the "FISHING GAZETTE," and send me a stamped directed envelope, and I will answer any question that they may happen to be not very clear upon. I shall next proceed to treat of the chub, and the various methods of taking them.

TROUTY "TAILS."

THE monster trout caught at Reading last year, and presented to, and graciously accepted by, Her Most Gracious Majesty the Queen of England, was probably a little "thing of beauty" when the late Mr. Henry Simonds, the popular brewer, whiled away summer evenings in spinning for trout in the central mill—"tail" of the virtual county town of Berkshire. The world-wide popularity of Huntley and Palmer's biscuits had caused the place to be commonly called "the biscuit borough," or "the biscuit

town;" but side by side with this most successful enterprise has been the equally successful one of the Messrs. Sutton and Sons' seeds and roots and flower establishment. Hypercritics have objected to the great biscuit factory and equally great seed stores firm enjoying an overpowering monopoly of names; but people will not therefore forget that Reading gave to the world of literature, of rich poetic fancy, of eloquence, and of legal acumen, a Talfourd, and that Mary Russell Mitford had rendered famous for all time the roadside village of Three-mile-Cross. But the Readingites had not been behindhand in other respects, notably, for present purposes, the formation of an Angling Preservation Association to protect and preserve a portion of the Kennet and that fine stretch of the Thames from the Roebuck Inn, at Purley of pleasant memories, to the lock at Sonning, hard by the beautiful "hanging" wood belonging to Holme Park, so long the residence of the late Mr. Robert Palmer, M.P. for the county.

But there are other trouty "tails" along the Kennet, especially at Newbury, &c. Whenever, in past times, the Kennet trout-fishing was mentioned, the angler other than local always thought of Hungerford, the inhabitants of which old roadside town being singularly blessed, not only in having such miles of splendid fishery as an inheritance for ever, but also in having a club of gentlemen anglers to preserve the fish and protect the streams for the benefit of both sides. There have been monster trout at Newbury, too. It is said of an old gentleman whom I can just remember (Mr. Toomer) that he kept several "monster" trout in a stew connected with the river, and boys five and forty years ago used to try to look over the hoarding that divided the tow-path and the stew in which these big fish had been kept. Only last year a trout of about 11 lb. ("monster trout" are only "monsters" here and at Reading when they arrive at from 17 to 19 lb. weight) got nabbed at one of the said "tails," other than with rod and line; while another fish (trout), of the moderate size of 8 lb., was found injured in the Kennet at Newbury. I mention these facts to show that while "monster" trout are not commonly caught, yet what would be called very "large" trout elsewhere, are by no means rare either at Newbury, Reading, or Hungerford. The local mill-tails have always been favourite harbours for the larger trout, and perhaps the Newbury waters are occasionally recruited, and with trout that come away in flood-time, in middle life, from Lord Craven's preserved back-waters and the old river, or even from Hungerford itself; and after knowingly winking their "weather eyes" at each and all the seductive art-made flies that "Ephemera" ever grew enthusiastic over, or that Mr. Francis Francis had ever "tied," or tried, with or without the aid of Judson, had come down into Newbury's trouty "tails" to live in peace and honourable retirement.

But here also the tempter was busy at times, in the person (among others) of friend Tayler, the jobbing tinman of Northcroft Lane, and a most devoted angler. Often and often have I seen him trying hour after hour for trout, as patient as the lady who, it is said, got up in a monument and smiled at Grief; and while I and other boys were flicking out the dace from off the scour by the town mill "tail," near the beautiful old parish church of St. Nicholas,* Newbury, Mr. T., with his home-made tin-ferruled rod, had got his eyes fixed on his taut line (leger), and on the hook was, probably, a nicely-scoured worm, and Spot and Co.'s noses not far off, perhaps, curiously wondering why the lively wriggler didn't come down along in a "nateral" sort of way. But when the honest tinman did "strike" and hook his fish, he was still as cool as a cucumber! He played his trout like an artist—a knack

he had, I believe, acquired far away from West Berks, and finally landed the beauty at the very convenient horse-watering shallows. Some few nice trout were caught last year at West Mills "tail."

The Newbury Angling Preservation Society are striving to gradually improve the all-round fishing in the Kennet within its beat, as well as a portion of the Lambourne, for the smaller kind of trout. The thing can't be done in one year nor two. Coarse fish are plentiful, and always have been plentiful in the canal hereabouts (with bleak and dace, gudgeon and minnows), which includes a good stretch of the old, or original, Kennet stream. At Hungerford only trout are allowed, so to speak, in the streams which are netted at intervals and jack and other coarse fish captured. But at Newbury this is not so, although it is a moot point whether the pike would not be better out of the river altogether. The Kennet is admittedly the finest river in England for trout, or is capable of being made such. The eels are superb for the table, large in size and silver-bellied. I was, as a boy, betrayed into setting a night-line in the borough waters, from seeing, hard upon 45 years ago, an old "weaver," as he dubbed himself (probably the son of one), lay down his fishing-rod one summer's evening, and soon after throw a line into the Canal—hooks baited, and a stone at the end. I did the same thing in a day or two, baiting with a nobby lob-worm that had been through the moss, and, lo! and behold, early on a certain dewy morning I found that

A twister a-twisting had twisted a twine,
And made a rough coil of my first night line.

Mr. Slimy spoiled my waistcoat, but what mattered that to capturing a 3 lb. Kennet eel? This sort of thing, and other forms of irregular fishing, is now of course prevented as far as possible in the interests of anglers generally, and of local ones in particular; still, no doubt a patient angler might capture a good eel with rod and line, even in daytime, for, next to a Kennet trout, commend me to a Kennet eel.

In the good time coming for anglers, the towpaths of *all* canals might be perhaps open for angling therefrom. Already, in the case of the Newbury Angling Club, Mr. Lloyd Baxendale, J.P., of Greenham Lodge, and also Mr. A. Tull, J.P., of Crookham, have generously allowed the members to fish in that part of the Canal that passes through their respective properties, reserving the tributary and other streams flowing through the private marshes and meadows to themselves. This is reasonable enough, because gentlemen do not like their waterfowl and birds disturbed, nor tenant-farmers their ground game, especially in these horrid bad times. The Towpath Question is not yet ripe for discussion. Agitation, in the common acceptation of the term, will ever avail little in inducing noblemen and gentlemen to grant the privilege of fishing from the canal towpaths over which they may have manorial or reserved rights. For good or for evil, London especially is absorbing the population from rural parts to an enormous extent. The tendency is observable in other directions to a less extent, independently of emigration. When the boys of to-day shall have become men, nothing will so much contribute to their pure and healthy and innocent enjoyment than a love of angling and of country scenery. Already some of the railways run cheap angling excursion trains, thus fostering a love of the sport. In time, when all rivers and canals shall happily be more and more preserved in the fence months, and protected from poaching, the London and other anglers will no. be slow in supporting those Clubs within reasonable and reachable distance by rail from large cities and towns; and in proportion that angling tended to improve the health, temperance, recreation, and elevation of the working and wealth-producing artisan and other busy bees, so the State will gain in many ways.

* This was one of the grand old parish churches built years before the Reformation, when

Fair Italy sent forth that true "Masonic" band,
That rear'd a wealth of Gothic fanes in our lov'd land.

NOTES ON THE NATURAL HISTORY OF FRESH-WATER FISHES.

BY J. HARRINGTON KEENE.

TENCH, *continued*.

IN my remarks on "pike," in the first paper of this series of notes, I expressed my belief that the fresh-water shark, either from gratitude or dislike, would not touch tench. I was quickly corrected by gentlemen, whose testimony I fully believe, who stated their experience, which amounted to having found tench in the interior of a pike. I have before said that carp will take their young—why, I cannot really determine—because for such an act of prey they are totally unfitted, both by structure and general inclination. In the case of the pike, there, however, seems no reason, except the sliminess of the fish, to deter it from taking a mucous-coated tench. Even this is hardly a reason against its taking the fish, for the pike will take and enjoy eels, which are insufferably more slimy, and will frequently capture and gorge the ruffe, which is still more mucous in certain seasons than either. That pike will not make a meal on tench, unless under exceptional circumstances, is abundantly proved, both by my own experience and that of other abler anglers, past and present. Mr. Fennell says (and his testimony is but a sample of many others), "I procured some small tench and fished with them as live baits for a whole day in some excellent pike water, but *without getting a touch*. In the evening I put on a small carp, and had a run immediately. I also tried some pike in a stock pond with the same tench, but they would not take them; and though left in the pond all night—one on a hook and one attached to a fine thread—both baits were alive in the morning, some pike-marks being visible, however, on the hooked fish." Of course, these marks rather strengthen the assertion held by Fitzgibbon, Hofland, Salter, Hollinshead, Oppian, Walton, and a lot of others, that the pike will not willingly take a tench. Salter tried the same experiment as Mr. Fennell, leaving his trimmers all night, and found that every trimmer but those baited with tench had "fished."

Why is this reluctance, then, in the pike? may be asked. Ah! dear reader, I cannot say. But the following is the reason given by some, admirably done into verse:—

"The pike—fell tyrant of the liquid plain—
With ravenous waste, devours his fellow train.
Yet, howsoever with raging famine pined,
He spares the tench—a medicinal kind;
For when by wounds distress and sore disease,
He courts the salutary fish for ease.
Close to his side the kind physician glides,
And sweats a healing balsam from his sides."

Hence, out of gratitude—how rare in mortals!—the pike refrains, says the poet. This is a pretty conceit, but I am afraid is not tenable.

Yet the tench is unquestionably a "physician of fishes." I always like a tench in trout stews—it cures byssus and generally keeps away *malaise* engendered by confinement and the irritable nature of the fish. Camden, in his "Britannia," speaking of the fish stews of Southwark, says:—"I have seen the bellies of pikes, which have been rent open, have their gaping wounds presently closed by the touch of tenches, and by his glutinous slime perfectly healed up." Yet another extract bearing on the subject, lest I seem to pronounce too pointedly of myself. Mr. Wright, in his book on "Fishes and Fishing," thus states the case:—

"A gentleman who was unfortunately unable to leave his house for some time, through an accident, amused himself by making small artificial flies, which he did very neatly. He kept some minnows and a tench, about 2½ inches long, in a very large wide-

mouthed bottle; all the minnows had died except one. My friend was just finishing a fly as I went into his room, and he held it upon the surface of the water in the bottle, as he was often in the habit of doing. The minnow darted at it so rapidly that he could not withdraw the fly in time to prevent the hook from pricking the minnow. The little fish descended three parts of the way down the bottle, poised itself for a moment with its nose pointing downwards, then swiftly went the remainder of the way, rubbed his nose during a few seconds *against the side of the tench* and again swum about as lively as before. We both joined in the opinion that it is really no fable as to the tench being the Esculapius of fishes, for here was an example before our eyes of a fish being wounded and immediately instinct directing him to seek a remedy."

I shall add no more quotations. I have never seen a pike rub its sides against the "kind physician," but I know that a low death-rate accompanies a tench into fish-stews. I only wish to insinuate, anent the tench *v.* pike question, that the instances many correspondents gave of pike taking tench *might* have been the effect of ravenous hunger or mistake on the part of the former.

GLISSADERMOS.

THIS Glissadermos is the best thing of the kind ever brought before the shaving public. Anglers will find it invaluable, as it enables one to have an "easy shave" in a few seconds. You merely have to press a tube on your chin, and then apply the razor; the preparation seems to soften the hair, and the razor clears it all off. A gentleman friend says the ladies are in raptures over it, as it leaves the delightful operation of kissing without a drawback in the shape of a scrubby male chin. This alone ought to make its fortune.

RODS MADE TO PATTERN.

IF any of our readers ever require a copy of some favourite rod, or, indeed, a new rod of any kind, we can, from the experience of several friends, who are first-class anglers, strongly recommend them to do a hard-working man a good turn and get satisfaction themselves by trying Mr. Irving, fishing-rod maker, Metcalf Place, near the Angel, Islington. Mr. Irving has made rods for over fifty years, and can make anything from a heavy spinning-rod for jack to a light fly-rod for trout; he has now in stock some splendid, almost solid, cane for spinning-rods. He makes split cane fly-rods beautifully; in fact, we have killed thousands of trout with his rods, and never been disappointed, except in one case, where we hampered him with various suggestions. If you tell him the kind of fishing you want the rod for, and leave him alone, you will be delighted with the result and its very moderate cost.

SPECIAL NOTICE TO ANGLING CLUBS.

ADDITIONAL PRIZES AT THE NATIONAL EXHIBITION.

WE are extremely glad to hear that the Grand Norwich Piscatorial Exhibition is receiving such support from all parts of the United Kingdom, that already the Committee have had to take a much larger space than the large building (St. Andrew's Hall) at first decided on. Over eleven hundred pounds have been subscribed for prizes, and the Committee at a meeting last Saturday decided to give a first prize of £20 and a second prize of £10 for collections of preserved fresh-water fish, and special arrangements as regards their carriage, &c., will, we believe, be made. We trust our club friends will lend their collections freely.

CORRESPONDENCE.

[We do not hold ourselves responsible for opinions expressed by our Correspondents.]

THE CURATORSHIP OF THE BUCKLAND MUSEUM.

SIR,—For the last two or three weeks letters have appeared in your journal, written by gentlemen who have taken a great interest in my welfare. I sincerely thank those gentlemen, and also the members of the Piscatorial and Thames Angling Preservation Societies, for their kind considerations of the welfare of myself and family.—I am, &c.,

RICHARD EDON.

Museum of Fish Culture, South Kensington.

GERMAN CORD.

SIR,—In reply to an inquiry for German cord, it is to be obtained of Carter and Sons, John Street Road, Islington. I have had one in use about twelve months, and it is strong as new.—I am, &c.,

ANGLER.

Newington Villa, N.

GERMAN LINES.

SIR,—In reference to your letter about German lines, we beg to state that we keep them, and shall be most happy to give your correspondent prices, &c.—I am, &c.,

G. LITTLE AND CO.

15, Fetter Lane, London.

FISHING IN THE UNITED STATES.

SIR,—Can you or any of your readers oblige me with some information with regard to the fishing in the United States? I contemplate a visit there this autumn (August to November), and I want to know what sport I may expect during those months and the kind of rods, winch, flies, spinning baits, &c., I shall require.—I am, &c.,

G. H.

[There is first-class fishing of all kinds in the United States, but you will find full particulars in "The Anglers' Guide," published at the *Field* office, Strand, London, price 1s. 6d.—ED.]

TO FISH-CULTURISTS.

SIR,—As I am now busy with a new edition of my German book on fish-hatching, it will be of very much value to me to know of all recent observations and improvements connected therewith.

I therefore beg, in the most friendly way, that you and your correspondents will assist me by communicating (in English) any interesting particulars and results you and they have obtained in pursuing the science of fish-hatching.—I am, &c.,

MAX V. D. BORNE.

Berneuchen bei Wusterwitz, Preussen.

THE PEACOCK FLY IN AUSTRALIA.

SIR,—I have a letter from my cousin, a merchant in Melbourne, dated December, 1880. He says that, feeling tired, and wishing for a couple of days' rest, he went up to Ballau, 100 miles from Melbourne, where he stayed with my brother. He took with him the spliced rod (Chatterton's pattern) which I got for him, and tried one of the rivers for trout with fly. He failed to get a rise; but, on going over to an artificial lake, he put on one of the peacock flies I gave him (my own pattern and manufacture), and ere long rose and captured a beautiful $4\frac{1}{2}$ lb. trout. It gave grand play for fifteen minutes, and was landed without net, gaff, or assistance. Since then, he writes that his cousin, with the same rod and fly, had captured a $3\frac{1}{2}$ lb. ditto. What joy this would have given to the heart of poor Buckland, had he been still with us! Talking of him, may I ask you and all anglers to read the notice of his life in "Macmillan" for February, 1881, by Walpole?

So enthusiastic have my cousins become, on touching such blood as $4\frac{1}{2}$ lb. and $3\frac{1}{2}$ lb., that I have just received an order for two more spliced rods and a lot of peacock flies. I wish them all success. I may state that on opening the trout to examine the contents of their stomachs, they were found to contain an immense quantity of small beetles—my cousin says, "like enclosed," but, I am sorry to say, he forgot to send it. I trust to get the sample some day soon. There are no minnows in Australia. If the peacock fly be said to represent a minnow, either that opinion is wrong, or hereditary instinct came into play!—Yours, &c.,

JOHN BRUNTON, M.D.

21, Euston Road, Jan. 31.

A PERSONAL MATTER.

SIR,—It is with inexpressible regret that I trouble you with one more letter, short although it be, but I am compelled by Mr. Spence to substantiate my statement, as nothing but absolute reference to the occasions and manner in which this gentleman uses the word parr, will bring home to him the meaning of his own words. I find in Mr. Spence's letters the following allusions:—

Nov. 13th, seventh paragraph. Allusion to a fish under the name "parr," with accusation of inaccuracy and apparent support of statement grounded on Russell, Yarrell and other modern authorities; in fact, those authors who call the samlet, parr.

Dec. 4th, paragraphs two to seven. The word parr is used throughout; the distinction of species is denied or doubted, and anatomical structure repudiated (paragraph 2). Paragraph five contains a wholly untrue statement, for parr and parr-marked fish are found abundantly where migratory salmonids are absent, and hundreds of anglers know this fact well. Paragraph six contains a statement which I challenge as matter of fact; for I deny that Mr. Spence could have opened and examined dozens of real parr without convincing himself that the fish were entirely distinct from salmonids, but nearly allied to true trouts. Yet if Mr. Spence can prove that he has opened dozens of fish having the structure which I have described as belonging to the parr and not that of the samlet, I should think his case no better, for then I should conclude he was incompetent to form an opinion. Seventh paragraph, acknowledgment of former error.

Dec. 11th. In the last paragraph but one, two allusions are made regarding the identity of the parr and samlet.

Dec. 18th, paragraph 4. "The apparent scarcity of female parr with ova of

any great size." There Mr. Spence is absolutely speaking of the samlet; he has yet to prove that the real parr conforms to this assertion. I have shown that the same writers have known little of the parr, and in the matter of females with ova and males with milt have made remarks which only apply to the samlet. I challenge the statements in paragraphs five, six and seven as well as eight; whilst I deny that it is the pectoral fin of the parr, which is described either by Yarrell or Parnell, as quoted by Mr. Spence, even allowing that this gentleman has made a correct quotation.

Jan. 15. Retraction of misquotation in letter of Dec. 18th.

Jan. 29th. Here Mr. Spence seeks to quibble on the matter of white-coloured fins, when my allusion could lead to nothing, but his own statement relating to whole-coloured fins. Whether I wrote "white" or whole, I am not certain, as I made a quotation; I suppose I meant whole, but may have accidentally crossed the "l" and made it "t." But whether this was so or not, it does not alter the facts in any way; but having substantiated my statement, I hope Mr. Spence will no longer protract the discussion by meaningless quibbles to have, womanlike, the last word with

THE RAVEN.

DAME JULIANA BARNES; BOULT.

SIR,—Can any of your readers furnish me with the names of the fortunate possessors of any of the 16th century editions of Dame Juliana Barnes's treatises of "Haukyng, huntyng and fysshynge"? I allude to copies not in public libraries nor in the Spencer or Huth collections. The information is required for the new edition of the "Bibliotheca Piscatoria."

The opportunity will also serve for asking for particulars (title, date, place of publication, and size) of "Boul's Sportsman's Companion."—I am, &c.,

Downshire Hill House, N.W.

THOS. SATCHELL.

SNIPE-SHOOTING WANTED.

SIR,—Do you think any of our numerous readers can inform me as to where I can obtain some snipe-shooting for the day, and if so, at what cost?—I am, &c.,

J. S. PERCIVALL.

FRANK BUCKLAND DEAD.

(From the American *Chicago Field*.)

It is officially announced in England that Prof. Huxley has been appointed Inspector General of Fisheries in place of F. Buckland, deceased. The appointment is good, but who will fill the place of the dead naturalist in all those respects wherein he was prominent and chief? Who will guard so jealously the fishing interests of the United Kingdom? Who will frame such sumptuary laws for Parliament to enact? Who will do so much for the love of doing, and so little for reward?

Frank Buckland's death, on the 19th of December, 1880, is described as a national loss. Perhaps it is even more; for the influence of his labours reached beyond the oceans of both hemispheres. It was felt in Australia as well as in America, and the intermediate continent of Europe. By the persistent labours of this indefatigable student, as the *FISHING GAZETTE* puts it, "He has stocked a continent with fish, and in his person and almost at his own expense, has done, so far as it was in the power of one man to do, for his own country what is done by the Government of other lands." This is the concession which the press of London claims for his efforts. Enthusiastic beyond compare in this particular branch of national science, ichthyology, his services were handsomely acknowledged at sundry times by testimonials and medals from various societies and corporate bodies in France and England. He was honoured, not only with many public offices, but by membership in many associations for the promotion of natural science. Educated as a physician and surgeon, he early abandoned his profession to devote himself to fish-culture and propagation, and, as early as 1863, established at his own expense the "Museum of Economic Fish-Culture," under the Science and Art Department of South Kensington. He was repeatedly appointed a special commissioner to inquire into the economy and abuses of the fisheries of England and Scotland, and his reports were made the basis of Acts of Parliament to regulate and govern the same. He was instrumental in planting and establishing trout and salmon in New Zealand and Australia.

Potential as were his leading efforts, the sum of his great usefulness was comprised in those constant investigations and contributions to natural science which he made throughout his long connection with the Fisheries and Natural History Department of *Land and Water*, features of that valued publication which earned for themselves the stamp of authoritative utterance and conclusive demonstration. Genial and easily accessible, he was the patron of fishermen, and the constant recipient of everything monstrous, rare or curious in nature; never despising the humblest inquiry, or refusing his services to those in search of knowledge. In this way he was enabled to discover and determine a vast number of new species and varieties, and thereby to greatly extend the sphere of acquired knowledge. Who, then, shall designate a person of his peculiar composition qualified to become his successor? It is for this reason, possibly, more than any other, that his death is deplored as a national loss.

Once in a generation some special spirit of genius rises up to elucidate those problems which have long baffled investigation, and having shed its effulgent radiance of scientific light and accomplished its sublime mission, disappears, to be succeeded by some other luminary of different elements, aims, and purposes. In this way, by here a little and there a little, the light of universal knowledge is diffused and permanently established. Frank Buckland was one of those special spirits of genius.

MRS. F. Y. BROCAS, Artificial Fly Dresser, 4, Mill-street, Conduit-street, Hanover-square, London, W. A stock of best flies always on hand. Flies made to pattern. Lessons in fly making given.—[ADVT.]

SUBMERGED ICE.

WE shall be much obliged to our correspondents who send particulars of the state of the rivers if they will ascertain if the bed of the river is free from ice. It frequently happens that there may be no appearance of ice on the surface and yet all fishing may be stopped because the water is deadly cold at the bottom from the ice there. Mr. Jardine gave us this hint, and says the ice will remain for weeks yet on the bed of the river in certain places.

CLUB REPORTS.

BOSTONIAN ANGLING SOCIETY.

The next return visit of No. 1 District will take place on Monday, Feb. 7, at the Dalby Tavern, Dalby Street, Kentish Town, when we hope to see all that can make it convenient to come.—H. TAYLOR, hon. sec.

THE BROTHERS RUMMUNS.

On the 2nd a meeting was held at the head quarters of the above society, the Rose, Thomas Street, Kensington, for the benefit of Mrs. C. Lacon (late of the Flying Dutchman) and her children, who have been left destitute, and to make things worse one child has just met with an accident. Mr. Thomas Haynes, P.G.M.B.R., presided, assisted by Mr. W. Breewood, S.L.A.S. The case was warmly supported by Messrs. Palmer, S.L.A.S.; C. Ellis, S.L.A.S.; J. Swindall, W.W.A.S.; Sutton, K.A.S.; the Brothers Raymond, K.A.S., and numerous other anglers and their friends. The vocal abilities of some of these gentlemen enabled all parties present to pass a very pleasant evening. The amount of money collected during the evening amounted to £6 7s. 6d., for which Mrs. C. Lacon returns her sincere thanks to those kind friends who have come forward to her assistance.—PIXIE.

Feb. 3rd, 1881.

CANONBURY ANGLING SOCIETY.

The Eastern District visit to the above society, took place on Monday last at the Albion, East Road. The chair was taken by Mr. Letch, ably supported by Mr. Wright. There were some capital songs sung during the evening, by the following gentlemen; Messrs. Letch, Wright, Gay, Monday, Key, Gould, Allan, Harding, Fowler, Humphreys, Comer, Waye and Shafe. The roll, being called the following clubs were represented.—The Amicable, Alliance, Convivial, North Eastern, Eustonians, Little Independent, Sir Hugh Myddleton City of London, St. John, Isledon and Hoxton Brothers. The next visit will be to the Little Independent.—W. H. PEARCE.

CLERKENWELL PISCATORIALS.

The half-yearly supper of the above society was quite a success; over 50 sat down to a capital spread; chairman, Mr. Trott; vice, Mr. Lynch. During the evening a number of prizes were given by different gentlemen. Amongst them were Mr. Bigsworth, brewer, £1 is. a year. The members of the above society will compete for a number of prizes on Sunday next at Taplow.—W. STEBBING, sec.

FREE ANGLERS SOCIETY.

The annual meeting of this society was held at the club-room, City-road Inn, Gaythorne, Manchester, on Friday, 21st January, when after the ordinary business of the evening was gone through, the election of officers for the ensuing season was proceeded with, the chairman, Mr. Ridgway, and vice-chairman, Mr. Mitchell being re-elected for the fourth time. The treasurer, Mr. Sumner and the secretary were also re-elected, and the committee being Messrs. Foster, Shillitto and Smalley, all thorough and enthusiastic anglers. Finding there were ample funds in hand it was arranged to hold the annual dinner on the following Friday (28th January), when members and friends mustered in good force and partook of an excellent repast provided for them by the worthy host and treasurer, to which all did full justice. The dinner over, a most enjoyable evening followed, each vying with the other in adding to the general enjoyment, and with such effect, that the evening passed much too quickly, as it was time to separate when least expected or desired. The toasts were six in number, the first being the usual loyal one of "The Queen," coupled for the sake of brevity with the Royal Family, which was duly honoured; the others were the chairman, vice-chairman, then the toast of the evening, "Success to the Free Anglers," and visitors and friends. The secretary, host and hostess, all with musical honours, and as most anglers are particularly great in chorus a hearty response was the result in each case. Interspersed with the toasts, songs, recitations, were given: the sentimental, motto, and comic, having its representative; and as most of the songs had a good swinging chorus, the effect was lively and fine in every sense; this was the more noticeable as a good and friendly feeling accompanied the singers in their efforts to add to the enjoyment of the evening; in fact it would be difficult to find a society where a better feeling exists, courtesy being the rule at all its meetings, which has had its effect in creating and cementing friendships which it is to be hoped will never be dissolved. One of the visitors was very happy in his remark on this good feeling, saying that "We do not angle for fish alone, we sometimes hook a friend and when once hooked, he is landed for all time." There is an end to all things, and anglers' dinners are no exception, so the Free Anglers had to separate at one o'clock, after passing one of the pleasantest of the many pleasant nights they have past together, all expressing regret they had to part so soon just as they were thoroughly enjoying themselves, the worthy host giving each a parting salute by opening sundry bottles of sparkling champagne.—W. R. R. sec.

GOLDEN BARBEL ANGLING SOCIETY.

Scarcely had the thaw commenced than some of the members of the above Society also commenced to make arrangements to visit "Father Thames" on

the 30th ult. Among them was that well-known veteran, Mr. J. Green, and Mr. J. Stanton, of chub fame some years ago. Both these gentlemen were rewarded by the "Ancient Pater" for their energy and perseverance, the former with 11 fish, and the latter with 2.—PIXIE.

Feb. 2.

LARKHALL ANGLING SOCIETY.

The members of the above society gave their fourth musical entertainment of the season on Wednesday, Jan. 26th, when a most attractive programme was put forward and very creditably carried out, for although the inclemency of the weather prevented several of the most prominent artists being present, a large number of members and friends assembled. Mr. G. F. Spencer, the president, occupied the chair, and was supported by Messrs. P. Geen, C. Davison, G. Nicholson, W. Tucker, W. Creak, E. Dangerfield, A. Piolaine, &c., the vice-chair being filled by Mr. F. Boyce. Before the entertainment commenced the minutes of the previous meeting were read and confirmed, and the President, in a few well chosen words, in which he highly eulogised the well-known efforts of Mr. Geen in promoting the interests of the great body of anglers, thanked that gentleman on behalf of the members of the society for his visit. Mr. Geen, who replied later on in the evening, in the course of a few able remarks, spoke of the pleasure it had given him in being present that evening, and although he had made it a rule, when he retired into the country, not to accept any invitations to such meetings, still there was no rule without an exception, and he had proved the rule by being there that evening. Continuing his remarks, Mr. Geen very forcibly urged the claims of the Anglers' Benevolent Society on all anglers and angling societies, and said that he considered it worthy of all support on account of the amount of good it had done. Several matters in connection with the private rights on the Thames were touched upon, and in conclusion, Mr. Geen (who was heartily cheered) expressed himself as having been highly entertained with the music and singing he had heard, and thanked the members for his evening's amusement. The concert was opened with a selection on the pianoforte given by Mr. Hallé of the Royal Aquarium, Westminster, after which Mr. A. L. Burgess gave, in his usual well-known telling style "Hearts of Oak." Mr. J. Edmondson received great applause for his rendering of the "Monarch of the Woods," as also did Mr. A. L. Green for his singing of "The lost child" (the original), and "Young Mrs. Crop." Mr. W. Wilden was very amusing with a "Parody on the Village Blacksmith." The "Burlesque Scene" of Mr. T. Sylvester was a great success and the "Bone Solo" of Mr. Fred Howe, literally "brought down the house." Mr. A. Creak met with warm applause for his singing of "Vanity," Mr. Fitzgerald received a flattering recognition of the manner in which he gave "Donnybrook Fair," whilst Mr. Cranch sang two songs in telling style, and the recitation of "The Signal Box" by Mr. W. Spencer was given as effectively as hitherto. I must not forget to mention that the pianoforte solos of Mr. Hallé were certainly a great treat. The following gentlemen, among others also materially assisted in making the entertainment a success. The entire musical arrangements were under the direction of Mr. G. F. Spencer. General regret was expressed at the unavoidable absence of Messrs. R. Edmondson, J. Lovett, A. Glover and C. Broadlake. The next musical evening will be held on Wednesday February 23rd. Owing to the numerous applications for membership, it has been decided to increase the number of members from the present limit and also to enrol honorary members.—VERITAS.

LITTLE INDEPENDENT ANGLING SOCIETY.

We were saved from a blank on Sunday evening, and we little expected it. Two of our members tried their luck, and succeeded in bringing in a nice little show of roach—Mr. Scott, 7 lb. roach; Mr. Humphreys, 2½ lb. roach. Hoping to send you better accounts before the close of the season.—W. BROWN, hon. sec.

January 31.

THE PISCATORIAL SOCIETY.

The annual dinner of this old-established angling club takes place in the Prince's Saloon, at the Holborn Restaurant, on Wednesday evening next, when a large and influential attendance is expected. Mr. Arthur Otway, M.P., who is taking great interest in the regulation of the Speed of Steam Launches Bill, will preside on the occasion, and Mr. Thomas Huggett, a thoroughly-practical angler, who presided at the summer dinner last year, will occupy the vice-chair. Several members of Parliament interested in angling matters have been invited.

PRINCE OF WALES'S ANGLING SOCIETY.

A complimentary visit was paid to the above society on Thursday, the 27th ult., when eight clubs were represented. Our old friend Mr. Osmond, of the Cambridge Friendly Angling Society, was voted in the chair for the evening, and was faced by Mr. Chambers, of the Cavendish Angling Society. The harmony commenced with a comic song by Mr. Chambers, and was followed by Messrs. Walter, Lovett, Willcocks, Rickards, Till, Beck, Parker, Sharp, E. Chambers (P.W.A.S.), Munslow, Edwards, Pierce, Osmond, and Roberts. During the evening Messrs. Walter, Lovett, Rickards, and Parker were loudly encored, and, as usual, had to oblige again. Our worthy host also came into the room and sang a good song, he also exhibited his good intentions towards us by giving all members present glasses each, of which between fifty and sixty partook. We drank to his jolly good health; and, after several more songs, we wound up an enjoyable harmonic evening in our new club house. The address of the society is—Victory Tavern, Newnham Street, John Street, Edgware Road.—W. LEE, sec.

Feb. 1.

SIR HUGH MYDDLETON ANGLING SOCIETY.

A complimentary visit will be paid to the above-mentioned society on Wednesday, February 9th, at 8.30 p.m. The new clubroom is spacious and capable of accommodating 150 guests, with every convenience upstairs. I hope our friends will rally round us on this occasion and give our new host a bumper. Leo. Bonvoisin, Esq., in the chair, Will Fowler, vice, and Messrs. Morgan and Ghurney, have promised to preside. The undermentioned gentlemen have promised to attend:—Messrs. W. Phillips, Fitch, C. Watling, and J. Wating, Great Northern Angling Society; Messrs. Mitchel, Hunt and Elliott, Brothers Well Met Angling Society, and many others too numerous to mention.—Only one of the members ventured out on the 30th January, Mr. G. Rogers. I

told him it was useless going angling, most rivers being full of ice and snow; still he thought otherwise. After plodding about in the mire all day he managed to capture one tench and 5 gudgeon, weight 1 lb. 6 oz., which made him the winner of £1 is.—G. CABORN, sec.

Jan. 31.

ST. JOHN'S CLUB.

A committee meeting was held on the 28th inst., when it was proposed that we close the fishing season for Club prizes on March the 7th; and what prizes there are left will be fished for on March the 14th. As there are a goodly number of prizes not won as yet, I hope members will come forward and make this a day to be remembered. We propose having a complimentary visit early in March, to give our worthy host, Mr. Gill, an idea of anglers in general, when we shall be happy to see some old faces at our new quarters, the Three Compasses, Cow Cross Street, where we have first-class quarters. The date of the visit will appear in next week's FISHING GAZETTE.—F. T.

Jan. 31.

A VERY SERIOUS, IRREGULAR PISCATORY ECLOGUE.

(Written in the Hackney Marshes.)

RECITATIVE—(*affetuoso*).

BOBBER (*log.*):—

My pretty dears, will you please to bite?
Waiting your pleasure from morn till night,
I've tried each wheedling art I know,
But, alas! my Sweets, it's all no go.

I see you all, as along you float,
With your pearly sides and sea-green coat,
And silvery waistcoats turned to the sun;
But my worthy friends you're not to be done.

CYPRINUS ALBURNUS (*log. banteringly*):—

Though I'm a Bleak,
Yet I'm not so weak;
Go try your fudge on
My friend, the Gudgeon

BOBBER:—

He will but trudge on,
And tak't in dudgeon;
And not a Roach
My bait will approach.

The big-headed Chub,
Whom I long to drub,
Like an ugly cub.
He does me snub.

And the glit'ring Dace,
He stares in my face;
And the wily Carp,
Is for me too sharp.

CHORUS OF FISH:—

The truth is, friend,
It will not do;
We don't intend
To be had by you.

We're up to snuff; you're a reg'ler muff;
You don't fish for us half fine enough;
With delicate palates, rather queasey,
We're longing for something rich and greasy.

But the water's bright,
And it's our delight
From morn till night,
As we have the right,
To frolic and play
All the sunny day;
And when night is come
And the sun's gone down,
We'll soundly sleep
Till morn doth peep.

Now to Beresford's* go and take your tea,
On the bank of our bright and sparkling Lea.
We'll on with our night-caps, and wish you good night,
For the devil a fish any longer will bite.

Exeunt omnes—laughing.

A BIG CONGER.—On Saturday, the 14th inst. (Jan. 14, 1769), a conger eel of an enormous size, was sold to a fishmonger at Billingsgate for five shillings; it was seven feet in length, and to the middle of the body was as large as the thigh of a stout man, weighing upwards of 100 lb. This extraordinary fish was discovered by the people of a Peter boat on the shore somewhere below Gravesend, who had the dexterity to land and throw a net over it, which intercepted the eel from recovering the river. Without this method or weapons, it could not have been overcome, as the conger will, when attacked, bite his assailant in as desperate a manner as some dogs.—*London Magazine*, 1769.

* The White House, Hackney Marsh.

FINE SPORT AT GUAYMAS, MEXICO.

BY CLIMAX.

WAMBAUGHT, one of the "gang," writes to Billy Carroll, from the above named place away out in Sonora, Mexico, giving a description of a fishing expedition, which is novel and interesting. He says:—

"No beer, no ice: muscat brandy and good cigars in abundance. Thermometer marking 115° in the shade; steel rails so hot that the natives have to wear leather gloves in handling them; yet with all these difficulties to contend with, I had a royal time. We got permission to use the tug boat belonging to our company, the *Ferro-Carril de Sonora* (Limitada), and on board we shipped a splendid lunch to add to the pleasure of our party, which consisted of six fellow *Ferro-carrilarios*, and an equal number of dark-eyed, black-haired *senoritas*, and the boat's crew, and off we put into the Gulf for a heavy fish.

"Well, if we didn't get it, and in a way that beat all my expectations.

"The boat's pocket—fourteen feet by six and five feet deep—was completely filled, as was the deck also; in all more than two tons of cavares, a fish built almost like our rock bass, but weighing from forty to sixty pounds each, splendid white meat, good flavour and fine sport. Our tackle consisted of very closely-knitted grass lines, five-eighths of an inch thick, and two hundred yards long; a chain snood one-half inch thick, with a steel hook proportionately strong, with the shank about eleven inches long, and a half-pound sinker.

For bait the much-dreaded octopus, or devil-fish, which, with all other kinds of salt-water fish, abound in the waters of this Gulf. Those used on this occasion, fourteen in number, were small ones, measuring one foot in diameter. They were taken by our native boatmen, by feeling down among the rocks, until one was found, then allowing the monster to clasp its snake-like arms around their wrists and hands in an embrace from which it never relinquishes its prey, then quickly drawing them on board, where they are at once despatched with a blow from an axe. One arm serves to take a number of fish, as the skin is so tough it cannot be torn from the hook.

"A good-sized cavares gives a man all he can attend to, and must be killed before landing him.

"The party also took and killed eight sharks, ranging in length from four to nine feet, ugly customers in the water, just large enough to take off a leg or an arm, and 'make a corner' on you.

"Since our arrival here one devil-fish, measuring twenty-two feet, has been killed, and others still larger are occasionally captured. The fishermen do not like to tackle these fellows, as they are very dangerous.

"The 'Spanish mackerel' taken in these waters are the most beautiful fish I ever saw, weighing from one to twelve pounds, and as game as a mountain trout. I thought of you as my charming companion was preparing a three-pounder for our dinner.

"Sunday is a grand holiday among the Mexicans. After our return from fishing (which, by the by, was on a Sunday), theatres and balls were in order, all very nice and cheap. The girls dance like sylphs, and the men are polite, so much so that *stilletoes* and 'Colt's 44' can be had for the mere asking occasionally *en el atro lado tambien*.

"This is a lovely country, and when the connections are made with the Sonora railroad, and those in Arizona, no more delightful trip could be made. The people are as different from ours in the States as though they were on another planet, yet it is partly due to that fact which makes me enjoy my sojourn here so much."

EPHING FOREST.—We understand, says the *Hackney Express*, that a strong move is about to be made by the opponents of the Great Eastern Railway Company's projected line from Chingford to High Beech. What is the nature of this move is at present, it seems, a secret, but the details will probably transpire in a few days. Mr. F. G. Heath is still, we understand, vigorously promoting the resistance to the measure. There is no doubt that the Railway Company and the Corporation (should the last-named body adopt the suggestion of its Epping Forest Committee) will have to encounter formidable opposition; for Mr. Heath and those he represents have already the support of the *Daily News*, the *Saturday Review*, *Punch* and *Fun*, the *Globe*, the *Echo*, the *Graphic*, the *Morning Advertiser*, the *Garden*, the *Gardeners' Magazine*, the *Weekly Times*, and *Lloyd's Newspaper*.

GREGORY'S SPINNING BAITS.—"The Gregory," the "Flexible Cleopatra," the "Oxford," and the "Colorado," pronounced by all Anglers and the Press the best baits invented for salmon, trout, pike, and perch. To be obtained from all respectable fishing-tackle shops in the world, and wholesale from Messrs. S. Alcock and Co., Standard Works, Redditch. Flattering testimonials speaking of the efficiency of the baits have been received from the Right Hon. John Bright, M.P.; Mr. William Bailey, Nottingham; the Rev. E. C. Holt, Teddington; Sir William Calder, Kingston-on-Thames, &c. Gregory's registered Archimedean spinning tackle for pike and trout, now ready, is pronounced by the press the best ever invented. For use with dead bait. The tackle is complete in every respect, and can be adjusted to suit bait of any size. Has been tried with remarkable success.—See that the name "Gregory" is impressed on the Archimedean fins, as inferior imitations are offered for sale, and people are thereby disappointed and deceived. Address, James Gregory, Vyse-street, Birmingham.—[ADVT.]

GEORGE JAMES EATON, of Starkholmes Matlock-Bath, Derbyshire, respectfully invites Noblemen and Gentlemen to try his standard FLIES for the present season. No flies sent or made up but what he himself has proved sure killers. A trial is all that is required from gentlemen who can fish to prove whether they may be genuine or not. Patronised by some of the best fishermen of the day. All flies dressed on the best Kendal hooks. Prices: Point Flies, 2s. 6d. per Dozen; Dropper Flies, 2s. per Dozen. Orders punctually attended to.—[ADVT.]

TO ANGLERS.—W. J. Cummins, Fishing Tackle Maker, Bishop Auckland, is now prepared to forward to anglers his Illustrated Catalogue, which is not only a Trade List but is interspersed with practical hints, useful directions, and valuable information gathered by the river-side from twenty years' experience. The stock consists of his unrivalled Salmon, Trout, Grayling, and Pike Rods, Lines, Reels, Baskets, Artificial Baits, Fly-books, Landing Nets, Gaffs, and last, but not least, his celebrated TROUT FLIES, which for killing powers stand unequalled. Every article kept in stock is of the very best description.—[ADVT.]

NOTICE.

Communications relating to the Literary Department, Fishing Tackle for Notice, Books for Review, &c., must be addressed to the Editor of THE FISHING GAZETTE, No. 12, Fetter Lane, London, E.C. and should reach the office not later than Tuesday morning.

Contributions are solicited, but the Editor will not undertake to return rejected MSS., unless accompanied with a stamped addressed envelope.

Correspondents are requested to write on one side of the paper only and give their real names and addresses, not necessarily as signatures to their letters, but as a guarantee of good faith. Unless this rule be adhered to no notice will be taken of such communications.

THE FISHING GAZETTE is published every Saturday, and can be obtained at Messrs. W. H. Smith and Son's Railway Bookstalls, and of the following, amongst other Fishing Tackle Dealers in London and the Provinces:—

Messrs. Alfred and Son, Moorgate-street.
Messrs. Price and Co., 8, Seymour-street, Euston-square, N.W.
Messrs. Williams and Co., Great Queen-street.
Messrs. Gee and Co., St. Andrew's-street, St. Martin's-lane.
Messrs. Gee and Co., Gray's Inn-lane (near Holborn end).

Newsvendors can obtain the journal through their London Agents.

*** The "FISHING GAZETTE" SPINNER (Registered) is sold by all the above firms.

ANNUAL SUBSCRIPTION.

The Annual Subscription, payable in advance, for the United Kingdom is 8s.; or post free, 10s. 6d.

To any part of Europe, the United States, and Canada, the Annual Subscription, including postage, is twelve shillings and sixpence.

ADVERTISEMENTS.

All communications respecting advertisements must be addressed to the Manager of THE FISHING GAZETTE, No. 12, Fetter Lane, London, E.C.

N.B.—All Remittances must be sent, and all Cheques and Money Orders must be made payable to ROBERT B. MARSTON.

The Fishing Gazette.

SATURDAY, FEBRUARY 12, 1881.

SHETLAND AS AN ANGLING RESORT.—III.

RETURNING to the road, we see on our left a small loch called Murister, which contains trout strangely mottled, but otherwise not remarkable; and after a trudge of about two miles round the base of Brouster Hill, with a splendid peep down

the narrow Grutting or Brouster Voe, reach the Bridge of Walls, where the Brouster enters the sea, forming a small salt-water pond, above the road, at high water. This pond contains good numbers of sea-trout at times, but, during the open season, both it and the voe-head are a good deal netted. After the wicked have ceased to trouble, however, those who know how to fish such places, for they require a special mode of angling, may do well in both; but such sport always partakes of the nature of a lottery. We must confess to not being very partial to angling in salt-water for sea-trout; one day you may fish till you are fit to drop from weariness and vexation, yet not see a fin; another day fish are leaping all around you but never a rise touches your fly, except, perhaps, when some peltok or sillock (coal fish) takes your fly and, for a moment, raises your hopes only to dash them once more to the ground; and again you go home with a "toom creel"; whilst on the third day, when you have given the business up as a bad job, somebody's little boy or some unmitigated duffer happens to light on a good take, has splendid sport and comes home to crow over you. Methinks some one says "sour grapes," but we can assure our readers it is not so, we have had splendid sport *at times* in salt water, but the blanks in the lottery are far more numerous than the prizes, at least such is our experience.

The Brouster, with its chain of lochs, offers a splendid run for sea-trout, and should contain far more fish than it does; but, owing to the netting which was once practised to an overwhelming extent in this district and still is, though on a smaller scale, the fishings have greatly deteriorated of late years. When we first visited Shetland there were always a good number of fish to be had after anything like a flood, but at present we should not like to make any such assertion: Two or three years ago the trustees of the late Dr. Scott, of Melby, to whom the whole western end of the island belongs, issued a warning to the tenants against netting; this was done in consequence of a petition from several anglers who had for some years been in the habit of staying at Walls for fishing, but the edict does not seem to have had much effect, judging from the numbers of fish to be found in the lochs here last year.

Of the lower or salt-water loch of Brouster we have already spoken; above it there is a short stretch of the stream much broken by walls built across the stream for the purpose of taking the fish on their return to the sea we believe, and above this comes Brouster Loch proper a shallow sheet of water, but one which used to give capital sport, and, though times have changed, a few fish may still be brought to bank by the angler. The eastern side is in our opinion best, and the lower end, there being more holes there; but if the angler fishes from the boat (for there is a boat on this loch) sea-trout may be taken all over the loch. A day with a moderate breeze is best here; the loch trout is small, about five to the pound, but of good flavour and "game."

After another quarter-mile or so of burn, we come to a larger loch called Voxterbee, where both loch and sea-trout runs larger than in Brouster, the former averaging about three to the pound; whilst, though it would be difficult to give an average weight for sea-trout, we may mention that we have on one day seen four fish of over five pounds brought to Walls from it. We may mention that we have seen several specimens of the fish, described by Couch under the name of Slender Salmon, taken in this loch and Brouster; a close examination of these fish showed, so far as we could see, no difference from the common salmon except in shape; unfortunately we had no books of reference with us so our examination was necessarily a little less thorough than we should have liked; but as to the main facts we can speak confidently. The shape was much that of the plate in Couch's

"Fishes of the British Islands," but the colour much less bright, which might be due either to the peaty nature of their habitat or to the colouring in Couch's book being too brilliant, or to both causes. The teeth were as in the adult salmon, there being a certain amount of roughness on the fore part of the vomer as if there had been teeth there. The number of abdominal coeca on the one examined was over sixty, sixty-three we think, and the number of rays in the pectoral fin fourteen. The specimen examined was thirty-five inches long, and only weighed five-and-a-half pounds. All the specimens we saw were taken in the autumn of 1874, and, we believe, were all pink fleshed. We were unfortunate in not being able to procure a specimen ourselves, or else we should have preserved it; but having landed one for another angler we noticed, what most experienced anglers know to be a characteristic of the true salmon—viz., that on seizing it round the base of the tail the fish could be securely held and lifted, a fact due to the great expansion of the gristle of the tail.

We once had a busy two hours in Voxterbee Loch some years ago. We had fished all day and caught nothing with fly, the day being very cold and rough, with a heavy gale blowing and the burn being in flood; so about five o'clock we fished with an artificial minnow at the mouth of the burn which runs in. In a very short time we took a dozen and a half good common trout, and then the take stopped; we had, however, seen enough to show us that the little bay into which the Brouster runs must be alive with fish, so, after again trying fly without effect, put on a stout worm cast with two hooks. Till seven p.m., by which time the rapidly falling darkness warned us to stop, we kept pulling out fish as hard as we could bait and cast in; and we may at once mention that the contents of our bag were a hundred and one loch trout, the largest about a pound and a half, the total weight being thirty pounds, besides one sea-trout of a pound and three-quarters. This was not such butchery as it may seem, as our landlady had a barrel of brine in which she pickled these fish for her winter use; still it was rather too much of a good thing, and our punishment followed it quickly. We were little more than two miles from Walls, and about three-quarters of a mile off there was a road being made which we meant to strike and so reach home in the dark. But we were not aware that in this road there was a gap of two or three hundred yards in width, and, as luck would have it, in the dark we passed through this gap, with the result that we spent the next few hours feeling about with the butt-end of our rods in the midst of a most uncomfortable mixture of bogs and small lochs. At last we saw a light and went "cross country" for it, now up to our knees in a bog, now flat on our face, and now and then descending some steep bank in a heap, till at length we reached the cottage, whose light we had seen, more like an animated mud-pie than a human being. The "gudeman" got out of bed and insisted on accompanying us more than a mile on the road home, though we only wished him to direct us; nor would he accept of the least remuneration for his trouble, nay, more, he actually called next day to ask how we were. We found we must have gone very straight in the direction in which we had started, as we came out on the main road some two and a half miles to the west of Walls at a place called Fontabroch.

AMATEUR SEA-FISHING.

(Continued from page 64.)

WE do not know how we can very well avoid drawing upon Mr. Wilcocks' "Sea Fisherman," Mr. Lord, Mr. Young, and other writers on sea-fishing, for the best description of the tackle necessary effectually to ensnare our prey, as they all agree in our experience. The first-named writer, from his long practical

experience of coast fishing in all weathers and seasons, is entitled to every confidence, as we personally know he does not recommend anything which he himself is not in the constant habit of practising. His descriptions of ground-fishing gear are as clear as it is possible textually to make them. He tells us the methods of fitting gear for ground fishing differ much in different localities. Much more, in fact, than necessity requires. The truth being simply this—that any tackle which will work clear, and place the bait within reach of the fish, will be sure to catch them; the form of the gear being bound, as far as success is concerned, by no arbitrary rules. But to fulfil its requirements, whatever be its form, the tackle must be the best of its kind, or it will prove a failure. In very deep water heavy sinkers are of course required, and even then it is impossible to keep the baited hooks near the bottom, during the strength of the stream of tide at the springs, which is necessary. For although the fish are sometimes found at a less depth, yet this is quite an exception to the general rule, and the baits should therefore be kept just clear of the ground. Off rocky headlands heavy gear is also necessary, even in a moderate depth of water; but in bays, and off parts of the coast where depth and stream of tide are not beyond the average, much lighter sinkers may be used, provided they will keep the ground. The most common error, says Mr. Wilcocks, is to use a stout line where a fine one would be just as effectual. This by necessity involves a heavy sinker, because a stout line holds so much tide that the bottom cannot be kept with a light one. Leads of one and of two pounds weight are very useful for most kinds of ground fishing along shore, and in common with others of greater weight are always filled with booms or bearers off to keep the hooks from twisting round the lines; which booms, whether they consist of wire, wood or whalebone, are known by the general name of chopsticks. Some are fixed, others revolve.

A snood, snead or sid, consists of the lengths of material to which the hooks are attached, and is of hemp, flax, silk, single or twisted gut, and twisted hair. The length of the snood is regulated by the kind of gear of which it forms a part.

Dip leads are of various forms: sugar-loaf, conical, bullet, &c. The Southampton dip is generally furnished with a sinker of one pound in weight in the form of an octagonal cone with a piece of brass wire, both firm and stout, about two feet long, cast into its base. This wire should have eyes turned at each end to which to attach the loop of the snoods. If small brass swivels are placed between the loops and the hook links the likelihood of the snods to kink will be prevented. The snoods must be always of such a length apart that the two hooks when brought towards each other will not touch each other. The loop on the top of the sinker being now attached to the tackle, and the hooks baited, the tackle is ready for use. The boat being anchored, the lead is dropped overboard and allowed to find the bottom; it is then raised a few inches to keep the bait out of the reach of the small crabs; and when a bite is felt a slight jerk will secure the fish, when it should be drawn on board with an even upward movement as rapidly as possible. Objections have been made to this tackle if used in water more than the depth of about twelve fathoms, as the cross piece of wire (or whalebone) offers a very great resistance to its passage through the water, and the shortness of your snooding is a great objection, particularly if the fish are shy. This description of gear is likewise used on other coasts, and in the North Sea for cod-fishing, with a four or five feet bar $\frac{3}{8}$ -inch thick, the resistance of which in hauling up from a great depth, "nearly," says Wilcocks, "doubles the labour for no adequate advantage."

There are other rigs, such as the Dartmouth rig, the Spool rig, boat-shaped rig, the Kentish rig and the Portsmouth rig, but they are more or less fitted up on the same principle; a sinker and

booms called chopsticks to keep the snoods from entanglement. In the Portsmouth rig there are often two or more chopsticks so placed on the line at intervals to attract fish at various depths.

We should advise, in the first place, the amateur to purchase in the locality a complete rig, which he would by examination have no trouble to imitate. Leads of all shapes may be easily moulded in wood, freestone, or moulders' sand from a foundry. Our own were made from moulds sunk in hearthstone, or what is known as Lardner's brick. If wires as fixtures are to be inserted this should be done while the lead is in a molten state; or if a hole though the length of the mould is required a piece, of wire of the necessary thickness should be worked backwards and forwards in the direction until the mass is cold when it can be withdrawn. To prevent the mould from cracking during the process of moulding it should be filled with hot ashes previous to using.

(To be continued.)

THE FISH OF THE TRENT, AND HOW TO CATCH THEM.

PLAIN PAPERS FOR PLAIN ANGLERS.*—No. 8.

By the TRENT OTTER.

THE CHUB.

I APPROACH the chub with feelings of very great respect, if not of actual veneration, for the chub with the white spot on his tail was the first fish that our father Izaak introduced to us; and after I had, metaphorically speaking, swallowed that chub, how eagerly I swallowed the rest of his grand old book; and then, like Alexander, who mourned because he had no more worlds to conquer, I mourned because there was no more to swallow. Although the chub does not enjoy a very good reputation from a culinary point of view, yet he is a tolerably handsome-looking fish; and when he is in good condition and hooked, he will fight hard for his liberty; and when we consider that it is absolutely necessary to fish for him with fine tackle, he is just the fellow to try an angler's patience and the strength of his tackle, especially if he happens to be a good-sized one. The chub is found in most of the rivers of England, and likes deep quiet holes, under overhanging banks, or willow bushes, the bottom of old walls, retired nooks, or where old piles and posts stick up out of the water, providing the water is tolerably deep; and yet he is not confined to such places as those, for you will find him in strong rushing streams, and contending with the most rapid waters. During very hot weather they may be seen basking on the surface of the water, over some deep hole, sometimes in considerable numbers, and the moment they become sensible that some one is looking at them, they sink down to the bottom in an instant, being perhaps, with scarcely any exception, the shyest of all fish. They spawn about the first or second week in May, and deposit their eggs on the gravel in very shallow water, and the operation is supposed to occupy them about ten days. He is a gross feeder, and will take kindly to almost anything in the shape of a bait, if it is only delicately offered him; he will swallow worms by the hundred, devour any amount of scratchings, gobble up all your ground bait, and still wish for more, even if that same bait happens to be rotten cheese; and I read somewhere that the French fish for them with a ripe cherry. He will take almost anything, from a fly to a small frog, or from a grain of creed wheat to a bunch of lobworms; and I have known him even to dash at a spoon-bait when pike-fishing.

His bill of fare is a very lengthy one: nothing seems to come amiss if he is only in a biting humour. He will take the artificial fly or natural insect on the surface; a bunch of lobworms from the bottom, or gentles and grubs from midwater; while the black slug, a small frog, cheese, or scratchings, all come to swell the list of attractions for our leather-mouthed friend, the chub. He will bite at nearly all seasons; hot weather or cold makes no difference to him. He can be taken by anglers knowing his habits and haunts in the winter months, as well as in the summer, spring, or autumn; only he seems to me to be a bit of an epicure, for the bait that he will take one month he utterly ignores the next. I don't mean all baits, but in some particular instances," for sometimes he will revel in the luxury of a nice bunch of gentles, and then perhaps you may go a week or two after and he will have none of it, but just drop a wasp grub over his nose, and your float will disappear with a rush, as though he had half digested that unfortunate grub in less than a second, or else would give you the idea that he meant to take it home for his wife and family, and was bolting off for that purpose. I will try to tell you, to the best of my knowledge and ability, the best baits to try all through the season, and how to use them, and when. But hold! the chub will sometimes attain a considerable size. We have heard of them being taken out of some Continental waters of the weight of ten pounds; but in England they seldom exceed the weight of six pounds. Indeed, if an angler is fortunate enough to capture a chub of six pounds, if he can afford it. I should say by all means have it preserved; it will be an ornament to his room, and every time he sees it it will bring back to his memory the recollection of the glorious bit of sport he had with it before it was grassed. The largest chub by far that I ever took out of the Trent weighed five and three-quarter pounds, a splendid fish, who fought hard for his liberty; but the biggest that I ever saw is one that was taken by Mr. Cubley, No. 9, Crown Street, Newark, out of the Muskham Waters of the Trent. Mr. Cubley is a first-class angler, and the chub I have just mentioned is now in a glass case as a proud trophy of the angler's skill; it is twenty-five inches long, sixteen inches in girth, and weighs six pounds, a splendid fish in the opinion of all anglers who have seen it. I hope it will be my good luck to take just such an one; but still, if an angler takes one of four, or four and a half pounds, he may congratulate himself that he has got a very good specimen; and if an angler by a bit of very good luck, should happen to take in a day's chub-fishing twenty fish that will weigh forty pounds altogether, he will find that to be a very good average, for large chub are not so plentiful now in the Trent as they used to be, according to the statement of Mr. Bailey, who a short time ago wrote an account of a few days' fishing here at Newark some years ago. He thought nothing then, according to his own account, of taking three chub out of one hole that would weigh twelve pounds. I cannot hear of any anglers who have been so fortunate as that this last few years, and I should hope for, as far as chub-fishing is concerned, a return of the good old times. Mr. Bailey is a perfectly trustworthy man, and I would not for the world accuse him of drawing the long bow; but nowadays a four-pound chub is a rarity, while, as I said before, in a day's chubbing, two pounds each fish would be a very good average weight.

(To be continued.)

THE ANGLER'S MISSING LINK.

WHO is to replace the link, now missing, in the great chain of usefulness that has existed for so many years between the anglers and the late Inspector of Salmon Fisheries? The question is not so much the appointment of a successor to dis-

charge the ordinary duties of that office. It takes a wider and broader view of usefulness than what is to be comprehended in the naturally limited sphere of a Salmon Inspector, and the angler has yet to realise what is to be to him the missing link. The late Mr. Frank Buckland became, as it were, every angler's property, and nothing delighted him more than to be made useful, in every possible way, to the angler. If a fish possessing some peculiar malformation was caught, no matter by whom, rich or poor, it was safe to be sent to Albany Street for information, with the absolute certainty that it would be clearly and properly explained. If there was some disease carrying off multitudes of fish, from a cause that wanted to be traced, as in the Norfolk and Suffolk rivers some two years ago, the opinion of the late Mr. Buckland was anxiously sought, and everything would be sure to be accurately described. If an angler succeeded in catching a fine specimen fish of any species, he would be sure to let the late Inspector know, and a cast would inevitably be made, either by his own hands or under his personal superintendence. Everything that was curious in natural history, and required explanation, was sent to him for his opinion, which was decisive, as no one ever doubted his authority. None of these things can be or will be necessarily attached to the duties of an Inspector of Salmon Fisheries, and it must not be expected that a successor will devote himself, as the late Mr. Frank Buckland did, in such matters as these, disconnected as they are from the Salmon Fisheries work. It was a self-imposed duty on the late Mr. Buckland, in which he delighted to labour, and it is there more especially where the link will be missed. He was ready to attend angling meetings and angling dinners, not altogether as an Inspector of Salmon Fisheries, but, in the society of anglers, to tell them of his work, and to suggest or advise anything that would benefit even those who catch the commonest species of fresh-water fish. He did it so lively and distinctly that all were in raptures with him during the progress of his remarks—his ready wit and humour always keeping his hearers interested in what he was saying. The annual dinner of the Piscatorial Society never appeared complete without his presence, but he has been absent on the two last occasions, all present regretting that indisposition alone prevented his putting in an appearance. He never came without bringing with him something in the way of specimens or casts to illustrate his remarks. His long and tedious illness prevented for some time previous to his death his public appearance in the assemblies of anglers, though he maintained all the briskness of his faculties to the last; and at Albany Street, if he was not elsewhere, his intelligence was always at work, and his well-constructed mind ever ready to impart information to the anglers, or to give his opinion upon any question of natural history. As long as he was alive the link still remained, and his usefulness, even during bodily suffering, kept it untarnished. His name, everywhere, was a talisman—it was an introduction and a passport to any one possessing the privilege of his friendship, and not a few have got into the best circles in that way. The great question is now, "Who will supply this missing link?" To a certain extent it can never be supplied. Few men possess the same warm, genial and liberal disposition which so deeply characterised the late Mr. Buckland. But the question will have to be guessed somehow. What the anglers want to know is this—to whom can they send any curious specimens of fish for information and get it done in the same way as it was done in Albany Street. It is not the kind of information which can be got through the columns of a newspaper that is wanted. The late Mr. Buckland went far beyond this by the processes of analysis and taking of casts, and he was at no end of trouble therewith. It was really made by him a labour of love, and not for pecuniary gain. These remarks are not simply intended as a panegyric on one who is

gone, although they naturally point to such an idea, but they are of a practical character. Whether they can be answered or not it is difficult to say. There can be no doubt that few, very few, men would undertake to do what the late Mr. Buckland did; and it is to be apprehended that his untimely removal from labours so useful and universal will create the greatest difficulty to be experienced by the anglers, and the conclusion will be that his death will long be felt as "The Missing Link." B.

FISHING QUARTERS IN DERBYSHIRE.

THE picturesque village of Rowsley, on the Liverpool and Manchester branch of the Midland Railway, is known to many anglers, but for the benefit of those who have never been there, I will try to describe its fishing resources, as it is well worth a visit. There are two inns there, the Railway and the Peacock, but the latter is the most resorted to by anglers; and Mrs. Cooper, being quite accustomed to have brothers of the craft as her guests, does all in her power to make them comfortable, her efforts, I will add, always meeting with the approval they deserve. The angler has the choice of two rivers in which to throw his fly, viz., the Wye or Derwent, the former of which empties itself into the latter a short way below Rowsley Bridge. Of the two, the Wye carries off the palm for fly-fishing, being a stream in which trout love to dwell, clear, rapid, sparkling, and flowing over a gravelly bottom, with quiet deeps too, to suit the taste of the shy grayling. The Derwent is broader and quieter than its sister stream, and is rather hard for a stranger to fish with much hope of success, as a knowledge of the fishing spots of the river is generally considered necessary. The Darley-Dale Club preserves the water from a little above Rowsley Bridge down to Matlock Bridge, but tickets can be got at the inn close by the river at Darley Dale (to which the angler must go by train), which give him permission to fish from there to Matlock, a nice long reach of water. Spinning the minnow and bottom-fishing are practised on the Derwent with more success than throwing the fly; in these two ways fish of 5 lb. have been taken. The river has also a few coarse fish in it, viz., pike, roach, barbel, &c. When in flood, many good trout are taken by fishing close to the banks with worms, allowing the stream to carry down the bait—a bite, of course, being known by its stoppage. A friend of mine in this way caught 4 trout, of 2½ lb., 2 lb., 1½ lb. and 1 lb. respectively, besides some smaller ones, and I myself have made some good baskets. The Chatsworth Club preserves the water through Chatsworth Park, which is the higher reach of water above Rowsley. Below Matlock Bridge the fishing is open; few fish, however, are taken, except in the deeps at Matlock, where the angler may, at times, obtain a few by bottom-fishing.

In order to fish the Wye in Rowsley Meadows, which is the best fishing to be got in any county, in my opinion, the angler must apply for leave to Mr. Nesfield, Bakewell, who is the steward to the Duke of Rutland, to whom the fishing in the Wye belongs. Leave is rather hard to obtain, but one day's fishing here is worth a hundred elsewhere. The stream is pretty free from obstructions, though in some places a detour has to be made round a plantation at the river side. The fishing extends from the bridge, a little above the junction of the two rivers, up to Tilleford Bridge. There are some splendid bits of fishing in it, and though only about two miles long, it is better than all the other reaches of the Wye put together. From Tilleford Bridge to Bakewell, a reach of 9 miles, may be fished by paying 2s. 6d. for a day ticket, obtainable at Mrs. Cooper's; or by staying at the Rutland Arms, Bakewell, this part of the river may be fished free. It is poor, however, when compared with the other reach, on account of its being much fished. I have seen as many as eight anglers

on one day perseveringly flogging it. Above Bakewell come the Ashford and Millersdale fisheries; the latter may be fished by paying 1s. 6d. for a day ticket. Above these, again, comes the Buxton fishery, on which the angler may fish by paying 1s. The trout here run very small. In rainy weather fishing is at a standstill there, on account of the white mud from the road—which runs alongside—being drained into the stream, when it becomes a dirty white torrent, in which it is a wonder to me how the fish manage to survive. The Lathkill, by the way, joins the Wye just below Tilleford Bridge, a stream well known for its fishing resources. No one is allowed to fish in it, except the Duke's particular friends. Six brace is considered a very good day's sport here. The fish run from $\frac{1}{4}$ lb. to $1\frac{1}{2}$ lb., the average size being $\frac{1}{2}$ lb. No fish may be taken on the Wye under 10 inches, and the only bait permitted is the artificial fly. On the Derwent 9 inches is the minimum length. I should mention, too, that no close time is observed for grayling on the Wye, but on the Derwent, the month of April is set apart for that purpose. The fishing on the Wye begins on April 1st and ends September 30th: on the Derwent it commences March 24th, and ends October 10th. The trout in both streams are very shy, seldom rising much, so great skill is necessary to effect their capture. The best flies to use are the blue and yellow duns, the soldier-palmer, and the black gnat, which must be dressed small. These are all sure, and no more are really necessary; but you may add the hare's ear dun, March brown and bumbles if you choose. I may add, too, that the finest tackle is necessary.

BLUE DUN.

WEST CENTRAL ASSOCIATION OF LONDON AND PROVINCIAL ANGLING SOCIETIES.

THERE was a largely attended meeting of the delegates of angling clubs affiliated to the above Association at the Portman Arms, Great Quebec Street, Baker Street, on Friday evening in last week. Mr. Leo Bonvoison in the chair, with Mr. Beckett in the vice-chair. Most of the principal clubs in London were represented, and amongst the names well known to the angling public were Messrs. R. Ghurney, Noble, G. S. Spencer, Dean, Gaynor, Murphy and others. After the minutes of the previous meeting had been read over and confirmed, Mr. Thomas Hoole, the energetic secretary of the Association, read a letter he had received from Mr. W. H. Brougham, inviting a renewal of the contribution annually given to the Thames Angling Preservation Society. The Chairman observed, as they had the pleasure of Mr. Brougham's attendance on that occasion, he would ask him to address the meeting at once, and he was sure those present would be very pleased to hear what he had got to tell them. Mr. W. H. Brougham, who was received with the greatest enthusiasm, expressed the pleasure he always felt in addressing them. It was not long ago when he specially attended a meeting for the purpose of soliciting their opinion in reference to some suggestions about to be made to the Thames Conservancy for some important and necessary alterations in a contemplated revision of the Lower Thames bye-laws, such as the sizes of fish, the measurement of fish, the season for jack, the enlargement of the Bait Act for fishermen only, the abolition of netting between Richmond Bridge and Kew Bridge, the power of imprisonment in lieu of fines, and the season for taking of trout. There was then some slight difference in their opinion compared with the views of the Thames Angling Preservation Society, but he was pleased to tell them that their opinions upon further consideration had been unanimously adopted. He regretted very much the absence of Mr. Thomas Spreckley that evening, as they all knew he was a friend to all true anglers; and he was authorised to state that had he known of the meeting earlier than that morning (having previously made

another engagement) he would have been present. Mr. Brougham then referred to a visit he and Mr. Spreckley had made to the Conservancy House on the previous Tuesday, in reference to the disgraceful catching of the dace at Teddington Weir last year, when they were heading up to the spawning grounds above, and the paddles being all closed, obstructing their further progress. They had now made the most satisfactory arrangements for this year; instructions were given for the opening of some of the paddles of the weir at the time of the fish heading up; a notice board would be put up to prevent persons from fishing on the top of the weir; and the river-keepers would be in attendance to carry out these arrangements. Mr. Brougham remarked, that as regards the question of private rights, which was now occupying great attention, he was happy to say their portion of the Thames was not at all fettered by them, but his society was not without sympathy in the movement that was being made for the upper Thames by the Thames Rights' Defence Association, though they could not, as being out of their district, unite with them. It would be desirable for any legal action to be taken by the association referred to, and not for the public to look to the Thames Conservators, as they were not in a position under the upper Thames Acts, to take the initiative, although he felt assured they would not discourage any attempts that were made for the removal of all assumed private rights, and would do all they could to encourage free fishing. Mr. Brougham concluded an interesting and practical address, which was listened to with careful attention, by urging the Association to renew its customary grant of twenty guineas. They were all aware of the exertions which were so energetically made by Mr. Thomas Spreckley which kept the whole machinery in constant and active operation, and he would with unerring confidence leave the matter in their hands.—Mr. Murphy thereupon, after some complimentary remarks, proposed that the usual sum of twenty guineas be given to the Thames Angling Preservation Society. He felt that their Association was mainly established to assist in the preservation of the Thames, and after what they had heard from their friend Mr. Brougham, they could not support them too liberally.—Mr. Dean seconded the motion.—After some few observations from the Chairman and others, the resolution was unanimously carried.—Mr. Brougham, in returning thanks, said that when he came before them again another year for a similar purpose, he trusted they would all feel that their liberality and confidence had not been misplaced. At that late hour he would be compelled to leave them, in order to catch his last train, and sincerely wished each of them a hearty good night. Mr. Brougham left the room with expressions of good wishes from all, and the meeting afterwards proceeded to the transaction of general business.

Magnetism and magnetic appliances have now become Household Words. Yet it is only a few years ago that the discovery of magnetism as an efficacious remedy in cases of nervous prostration and weakness of the system was first made, and this useful invention turned to man's profit. Since that time magnetism as a curative aid has made wonderful progress, and is now welcomed and recognised by the Medical Faculty. We have been favoured with a pamphlet, entitled "Curative Magnetism, or Nature's Aid to Health," the perusal of which is the mainspring of these observations. It set us thinking, and we are not without benefit from reading it. It is published by Mr. J. Hugh Martin, 272, Regent Circus, London, W., to whom we can confidently recommend any of our readers interested in the subject, to apply, as one holding a well-defined position as an authority on the subject.

GREGORY'S SPINNING BAITS.—"The Gregory," the "Flexible Cleopatra," the "Oxford," and the "Colorado," pronounced by all Anglers and the Press the best baits invented for salmon, trout, pike, and perch. To be obtained from all respectable fishing-tackle shops in the world, and wholesale from Messrs. S. Allcock and Co., Standard Works, Redditch. Flattering testimonials speaking of the efficiency of the baits have been received from the Right Hon. John Bright, M.P.; Mr. William Bailey, Nottingham; the Rev. E. C. Holt, Teddington; Sir William Calder, Kingston-on-Thames, &c. Gregory's registered Archimedean spinning tackle for pike and trout, now ready, is pronounced by the press the best ever invented. For use with dead bait. The tackle is complete in every respect, and can be adjusted to suit bait of any size. Has been tried with remarkable success.—See that the name "Gregory" is impressed on the Archimedean fins, as inferior imitations are offered for sale, and people are thereby disappointed and deceived. Address, James Gregory, Vyse-street, Birmingham.—[ADVT.]

RIVER REPORTS

MID-THAMES.

"Smooth runs the water where the brook is deep,
And in his simple show he harbours treason."

—SHAKESPEARE.

The Thames just now is running very smooth and deep, but there is treason in it with a vengeance, as fishing is impracticable, and the minds of anglers who had anticipated a final day or so, or even week, in a favourite haunt amid the perch and jack, are filled with malice, hatred and all uncharitableness. Well, never mind, something may turn up for good, for it is surely an ill wind that does not do even an angling man some good. In the mean time I would advise prudent piscators to "look well to their tackling," oil each rod, varnish ring whippings, try every line yard by yard, and give a coat to comfort, in enforced laziness—in short, let not a tackle be disregarded, or an unconsidered article be unseen to, for wily damp and disuse will assuredly take off the keen edge of beauty and usefulness if these little matters are neglected. During the frost and snow J. Rixon, of Hurley, had the good fortune to shoot close to Newhook Weir a fine female otter, which scaled 17½ lb. and measured 42 inches in length. The "beastie" was subsequently purchased by Mr. Sykes and exhibited at the Piscatorial Society, most members expressing their pleasure that Old Father Thames was rid of such (a "thing of beauty" in death) an arrant poacher in life. Thursday evening.—River in high flood; and as to the rain, it raineth every day, this state of aquaphobia is likely to continue, and even much increase. Angling out of the question.—MARLOW BUZZ.

Thames (Goring).

The water is very thick, and a flood water going up again. There will be no fishing for some time. The weather is very gloomy, with every appearance of more rain. There will not be much more fishing this season. Bad times for we poor fishermen.

Thames (Kingston).

A trout was found dead close to F. W. Bond, Esq.'s, Swiss Cottage, Hampton Wick. Length, 2 feet 8 inches; girth, 1 foot 3 inches; weight, 9½ lb., ought to have weighed over 14 lb. There has been nothing done here in fishing, only a few roach from the bank. The river is all over the place, and still rising.—JOHN JOHNSON.

Thames (Teddington).

The water is rising, and very thick after the very heavy rains we have had; but, if the weather keeps fine, the water will soon run down again, as the tides are very low. In one day Mr. Edwards caught 9 bream, and 1 carp of 9 lb.; Mr. Haley caught 2 carp—one 3 lb., and one 4 lb. Weather dull and cloudy.—J. BALDWIN, Fisherman, Teddington.

Thames (Twickenham).

I am sorry to inform my customers, whom I advised last Sunday not to go out fishing, that the river does not look any better now, than it did then, and there cannot be any hopes of starting for at least another week. The land water is standing at high-water mark.—ALFRED PERRIN.

N.B.—I am sorry to say that poor Jem Brand is still very ill, but I am pleased to say that Capt. Moss (one of Jem's old patrons) has kindly opened and headed a subscription list, and will kindly receive any small subscriptions on his behalf. Address: Capt. Moss, Easterfield Villa, Hanwell.

Dove (Derbyshire).

Water, water everywhere, and more than enough, not only to drink, but to drown an army. We have had a perfect deluge of rain since Monday, and the river is now running like a mountain torrent. There was good sport on Saturday, one gentleman caught 4½ brace of grayling below Mayfield with the cocking and winter duns. Two other catches of 5½ brace and 4 brace respectively near Uttoxeter and Birdgrave have also come to hand. I can hear of no coarse fish being taken. Trout are occasionally landed while grayling fishing, but of course have for the present to be returned to the river. Some of the private pike waters are now closed.—THE SPLODGER.

Lea (Cook's Ferry).

For the last few weeks the river has been ice-bound and snow-bound, and, instead of fishing, we have had skating. That has now passed and left the waters in an unfit condition for fishing. On Sunday we had a large number of anglers from all parts, anxious to try their luck, but, on account of the unsettled state of the waters, their takes were small. Should we be favoured with fine weather by the end of the week and the waters go down, we may look forward for better prospects.—S. SEWELL.

Lee (Co. Cork).

An immense quantity of rain has recently fallen, and the river is flooded to an extraordinary height. At the meeting of the conservators to-day, it was stated that a large quantity of fish had gone up, and that the prospects for the opening on Tuesday were very good. The weather continues unsettled, and the bank-height floods are likely to last for the week.—A. H. S., Cork.

Suir and its Tributaries (Clonmel, Ireland).

We have had a high flood here since Sunday last, and we hear of great numbers of salmon going up the river, so that the upper waters will be well

stocked with fish. The cots killed at Clonmel on Monday, eighteen; Tuesday, eleven; and Wednesday seven, and would have caught greater numbers, only they, thinking the river too high, did not venture out, but had such success during the first draw that they have continued to fish still in the flood, which they usually used not to do. The cot-men tell us the river is swarming with spring fish. No salmon have been, to our knowledge, caught by rod as yet, but when the water gets low we expect to hear of good sport. The trout fishing is better than we anticipated, some good ones were caught on Sunday last. On Monday Captain Dixon, Mr. Park (18t1), and Mr. Wilkinson killed five dozen on the Clodiagh with both flies and worm. Major Toppin, Mr. Middleton and several others being successful, also Major Chalmers. There is not much poaching doing at present, we heard of one case of it yesterday on Glenmorgan stream. A young man hunted a salmon (kelt) down the stream into a pool, and when going to strike the fish on its head with a stick he fell himself into the pool, but however succeeded in landing the fish, which certainly was unfit for use. The killing trout flies are gold-spiders, red hackles, and rat's-fur and red-hackle. The rain still continues to-day so we expect there will be no fly-fishing for a little time on the Suir, but some of the mountain streams can be always fit for flies, the flood runs down so quickly.—DORA.

Feb. 9.

Trent (Alrewas).

The idea that we had got rid—at least, for this season—of biting blasts, and all the Arctic terrors by which we were besieged a few weeks ago, has been utterly dispelled. Just when we were beginning to anticipate an early commencement of piscatorial enjoyment, and with some prospect of the spring dawning upon us, and genial sunshine taking the place of leaden skies and a phenomenal atmosphere, we find ourselves completely settled by another disastrous flood. Snow commenced to fall heavily on Monday followed by an incessant downpour of rain. All the rivers in the Midlands are now out of bounds and hundreds of acres of meadow-land completely submerged. With the elements so unfavourable, nothing has been done in the shape of angling; neither are the prospects for the next week at all favourable. The weather, at the time of writing, is still unsettled; and the wind is blowing a gale from the north-east.—JAMES GREGORY.

Thursday Night.

Trent (Newark).

On Monday the water in the lower Trent had begun gradually to go down and I entertained hopes that I should soon be able to commence operations; but the decree had gone forth that I, as well as numberless other anglers, would have to wait a little longer, for, early on Monday, we had a terrible snowstorm, to be succeeded in the afternoon by a heavy rain. So, on the following day, the water again begun to rise, and we have had a quantity of rain since Monday—notably, last Monday night—when it rained very heavily for ten hours, so that to-night (Thursday) the whole valley of the Trent is covered with a dreary waste of water. The water is still rising, and is now only a few inches lower than the great flood of a few weeks ago; so that anglers may rest contented and wait with what patience they can for a favourable change. Nottingham and Sheffield anglers, who make Colliingham their fishing-quarters, will be sorry to hear of the sudden death of Mr. Turner, of the Jolly Bargeman Inn. He took a couple of horses to meet his boat at Marnham Ferry, and he had no sooner got there than he fell down and died in a few minutes.—THE TRENT OTTER.

Trent (Nottingham).

The weather during the last eight or ten days has been so unpropitious for rod-fishing that nothing worth mentioning could be done. The last frost together with the heavy fall of snow, went away so gradually that some of the rodders thought there would not be much extra water come down. In this, however, they were deceived; for after one day's fishing, in which there was some good execution done among chub, roach, and dace; and in a few hours after the river began to rise rapidly, which at once put a stop to angling. Sunday, however, turned out a fine dry day, which caused the river to somewhat settle down, and there appeared at about midday a chance of the water getting into condition on the following morning for bottom fishing, which turned out to be quite right, and several anglers were prepared to start; but before they got to the station there was every indication of more snow, and in a short time after it came down proper, and was quite a snowstorm during the remainder part of the day. Rain then quickly followed, which sent the snow away rapidly. The result was as was expected, another flood; and up to the time of writing there does not seem much prospect of any rod fishing being done for several days. Though the weather seems to have changed for the better, and it will only remain so for a few days the Trent will soon be in condition for bottom fishing.—W. BAILEY.

Wensum (Norwich).

This small stream, not much patronised by anglers, was visited during the past week by several gentlemen of Norwich. Amongst them, Mr. Waythe, of Mile End, a most enthusiastic angler, who succeeded in landing forty decent-sized roach—bait used being brandlings—whilst another gentleman, close by him, using red paste, did not take a single fish. This stream will undoubtedly become a favourite resort during the coming season, as, since the passing of the Fisheries Preservation Act plenty of fish of every description are to be had. The best spots are the Horse-shoe Hole, the Dolphin Staithe, and Masters' Reach, between the New Mills, Norwich, and the Mills at Hellesdon. I am informed also that there are plenty of pike in this river, which I hope may be true.—ANGLER.

Wye and Derwent (Derbyshire).

Monday morning opened with a very heavy fall of snow, which fell heavily all day. Then it turned to rain in the evening, which continued up to Wednesday. The rain scarcely ever ceasing, with the wind raging with unabated fury nearly the whole time, has caused Derbyshire to be visited with one of the largest and most disastrous floods ever known to be to the oldest inhabitant living, doing an immense quantity of damage. All down the valleys of both the Wye and Derwent have been one vast sheet of roaring water. All along the valley of the Wye, from Ashford, Bakewell, Haddon Hall and Rowsley, and on the Derwent, from Bastow, Chatsworth, Rowsley, Dailey Dale, Maslock, Cromford, Whatstandwell, and even down to Derby, have had the appearance of a large lake—the waters being furiously driven up and down by the hurricane, which was prevailing nearly the whole time the flood was out. At Matlock Bridge the flood was once over 5 feet high in the houses, both furniture and other things floating about in the houses from Rowsley. The Midland Railway Company had a very great quantity of sleepers washed away with the flood. The foot-bridge which leads to Matlock town from the Dale, which crosses the river Derwent, was washed down, also a great quantity of barrels

and other things were washed away from Mr. Steven's Paint Works, Matlock Dale. Both Matlock town and Matlock Bath suffered very much from the effects of the floods—it caused very many persons in both places to have several feet of unwelcome water in their houses, in fact, there was a boat race in the main street at Matlock Bath, while the flood was at its height. There have also been several dead sheep and deer, and a great quantity of rabbits have been seen floating down the Derwent. The bleach net party have killed a good deal of fish during this flood with their nets, viz., trout, grayling and coarse fish. The trout in very good condition considering the early season for them. There will be no angling with rod and line for some time to come.—GEORGE JAMES EATON.

P.S.—Can any person be summoned or convicted for taking trout at this time of the year where he has permission to fish? I think not, as the Fresh-water Fisheries Act for 1878 will protect him.—G. J. EATON.

Yare (Norwich).

The water has again risen very much owing to the late heavy rains, and all prospects of angling for several weeks are put a stop to. A man netting for bait opposite Messrs. Wright and Wellington's timber yard, King Street, took two large pike, and he informed a friend of mine that he had repeatedly seen several in that vicinity of late. I am sorry to have to report a very narrow escape of the worthy chairman of the East Anglian Piscatorial Society (Mr. C. S. Fowler), whilst trolling for pike at Fornsett near Norwich. His bait-kettle having slipped into the river from the bank, he was endeavouring to recover it when the rail upon which he was leaning gave way and precipitated him into the river, and, unfortunately, into a deep hole—depth about 12 feet. His shouts for help were heard by his brother, who fishing some distance from him, and fortunately arrived just in time to rescue him after he had gone down the second time. He was speedily removed to a neighbouring farm-house, where everything was done to render him comfortable, the worthy farmer lending him an entire change of clothes, which were very acceptable; when, after refreshing the inner man, he arrived home to the club house not much the worse for his immersion.—ANGLER.

Yare (Norwich).

The water has gone down considerably and is much brighter, so much so that two gentlemen of the East Anglian Piscatorial Society ventured out for a few hours' roach fishing on Friday last, but without much success. Mr. G. Hart, of the Thorpe Gardens, whilst angling on the broad on Tuesday last captured a very fine tench, weighing upwards of 2 lb., also, on the same day, he succeeded in landing a brace of jack. Mr. Harper, of the Buck Inn, Thorpe, showed us some very fine carp, which he had taken from a pit on a farm a few miles from Norwich. I have just heard that circulars are issued to members of the Yare Preservation Society, calling a meeting for the purpose of taking into consideration the best means of improving boats for angling. The sky has again assumed a wintry appearance, and snow has commenced to fall.—ANGLER.

Yore (Yorkshire).

My star of hope was in the ascendant on Saturday last, as the main river was running in beautifully, and other two days of fine weather would have found me on the banks of the stream, rod in hand. Unhappily it was destined otherwise, for on Monday snow fell incessantly all the day, followed by a rapid thaw on Tuesday, which once more filled the river bank full with snow water, and again put off all chance of angling to an indefinite period.—F. M. WALBRAN.

ANGLING DESCRIBED.—A cynical writer, who evidently knew nothing of the pleasures of angling, and seems to have had a great contempt for what he did not understand, once described the occupation of fishing as "a stick and a string, a worm at one end, and a fool at the other." It has long been the custom to attribute this rather foolish saying to either Dr. Johnson or Dean Swift. Some years since Mr. Pinkerton pointed out (*N. & Q.*, 3rd S. x. 472) that the thought was due to a French writer of the seventeenth century named Guyet, who quoted an old saying:—

"La ligne avec sa canne est un long instrument,
Dont le plus mince bout tient un petit reptile,
Et dont l'autre est tenu par un grand imbecile."

It would be of some interest to know when and where these lines are to be found, and who was the writer, as there were several of the name of Guyet; but it would be still more interesting to know upon what grounds the saying is so constantly attributed to Swift and Johnson.—Edward Solly in *Notes and Queries*.

ICEBERGS ON THE YARE.—Many tons of ice came floating down with the tide on Tuesday, and some of the pieces before colliding with the bridge at Yarmouth, appeared as wide as the river itself.—*Norwich Argus*.

THE RIGHT HON. JOHN BRIGHT, M.P., it is said, seldom smokes during the Parliamentary session, but, in the holidays or recess, when by loch or river, angling for salmon—fit sport for such a man—the right hon. member indulges in the fragrant weed, preferring the best cigars.

ANGLERS should always be provided with something to take away the swelling and poisonous effect of the bites of insects. They should also have with them something to apply to a cut or sprain. Pond's Extract reduces the swelling and inflammation, stops bleeding and pain, and hastens the healing process in case of any wound or sprain; and it has no equal for application to the bites and stings of insects. Therefore never go on a fishing excursion unprovided with a bottle of Pond's Extract. It is for sale at all chemists, at 2s. 3d., 4s. 6d., and 8s. 6d. per bottle.—[ADVERTISEMENT.]

TIRED HANDS AND ARMS.—Edson's Electric Armlets and Wrist Bands. Invaluable for anglers and gun sportsmen and highly recommended for all persons having tiresome writing, sewing, or music practice. They give wonderful energy and strength, enabling the wearer to accomplish tedious work with steadiness and comfort. Price 2s. 6d. per pair, silk web and fine steel clasps. Sent to any address on receipt of P.O.O. payable to J. Edson, the Electric Fabric Co. Patentees, No. 1, Charlotte Street, Bedford Square, London W.C.—[ADVT.]

MRS. F. Y. BROCAS, Artificial Fly Dresser, 4, Mill-street, Conduit-street, Hanover-square, London, W. A stock of best flies always on hand. Flies made to pattern. Lessons in fly making given.—[ADVT.]

THE NEW INSPECTOR OF FISHERIES,

THE *Athenæum* is our authority for stating that Professor Huxley, F.R.S., will not resign any of his appointments in consequence of accepting the post of Inspector of Fisheries. As, however, these appointments already include the important ones of Naturalist to the Geological Survey of Great Britain, Lecturer in the Royal School of Mines, and Secretary to the Royal Society, it is not an unfair question to ask how much time will in future be devoted to the inspection of fisheries, which would be none the worse off even if there were three inspectors for every one employed at present.

THE FISHERIES OF THE UNITED STATES.

A REPORT has just been issued by Dr. Spencer F. Baird on fish and fisheries of the United States of America. He deals with the history and statistics of the food-fish of the different coasts, rivers, and lakes; their decrease and the mode of preventing it; their propagation; the quality of the fishes; their value and economic uses; all points of considerable interest at the present time, in relation to the exhaustion of many of the British lakes and rivers and the rapid decrease of several descriptions of fish around our shores.

RAT CAPTURED BY AN OYSTER.

THE accompanying illustration represents a very curious capture of a rat which was brought under our notice some time ago by Mr. Prosser, the well-known oyster merchant, close by Temple Bar. Rats, we know, have a remarkable instinct in finding out good quarters for themselves, not only where they will be comfortable and securely lodged from the intrusion of unwelcome visitors, but where they will also have easy access to plenty of good food. Mr. Prosser's establishment in Fleet Street presents what may be called a very paradise for rats. Throughout the whole house from roof to basement are innumerable nooks and crannies behind the wainscoting, under counters, and between the floors, in which are many secure retreats. Provisions of all kinds, moreover, are plentiful, so it is scarcely to be wondered at that Mr. Prosser is constantly troubled by depredations on his stores from these hungry feeders. He has tried various means to get rid of them—traps, poison, etc.—but all to little or no avail, as, no matter how many are killed, the numbers appear to increase rather than fall off. He has now given up traps and poison, and depends altogether on two bull-terriers to keep these pests of the household in check. These useful little dogs are constantly and suddenly let loose in the vaults beneath, where oysters, etc., are stored. They are very quick, and generally manage to account for a rat or two, who, taken unawares, are quickly despatched. Rats appear particularly fond of oysters, and appear to know what a good one is, as they as a rule pay particular attention to the natives. Numbers of them are kept below, and during the cold weather are covered with sacks to keep the cold out. The rat the hero of the accompanying sketch, was found exactly in the position represented. Mr. Prosser, entering the vault, heard a rustle under a sack, and on going to see what was the matter was

astonished to find a fine, well-fed rat closely fastened by the tail in the mouth of a native (the artist has unfortunately not been very successful in his attempt to represent a "real native"). The rat was struggling hard to free himself, but the oyster held close grip and would not let him go, so Mr. Prosser called his terriers, one of which soon put an end to the rat's struggles. Some of the oysters in the barrel showed that Master Rat had been feeding on them, and Mr. Prosser thinks that by some accident the tail of the rat got into the mouth of a lively open-mouthed oyster, who, not liking the intrusion, firmly closed "his jaws" and held on tight. We have seen several instances of mice being caught by oysters. In the collection of the late Frank Buckland were several specimens, but in all these instances the mice were caught by the heads. In one case two mice had fallen victims to an oyster. The case of the rat given above is, we think, worthy of being recorded as a curiosity of natural history.—*Land and Water*.

[We are indebted to the courtesy of the editor of *Land and Water* for the loan of the illustration of this most curious incident. We hope Mr. Prosser will preserve the bivalve and its captive, and exhibit it in his shop, which, by the way, is one of the best in London for oysters.—ED. F. G.]

STATEMENT OF THE THAMES RIGHTS DEFENCE ASSOCIATION TO THE CONSERVATORS OF THE RIVER THAMES.

"WE have been asked by the Conservators to place our views and wishes before them in writing.

"We applied to the Conservators because we regarded them as a body appointed by Parliament and the Crown, to watch over and protect the rights of the public in regard to the river, and to regulate the due enjoyment of those rights; and that such purposes might be effectually secured, the Conservators were empowered to raise funds, by taxation of the public, under Acts of Parliament.

"Various occupiers of land abutting on the river have been attempting to claim, as private, certain Public Rights upon or adjacent to it. There is good reason to believe that the claims, so set up, are quite unfounded, and our Association being interested in maintaining those rights of way, navigation and fishing, on the river, which have been enjoyed by the public for a very long period, applied to the Conservators to uphold the Public Rights, and to resist attempts made to infringe them.

"We beg to suggest that Clauses should be introduced by the Conservators in the Bill now before Parliament, relating to the Thames, so as to secure to all anglers, oarsmen, and pedestrians the enjoyment of the river and the streams flowing therefrom, as previously used by them. In order to attain these objects, we conceive that the Act should prohibit, under penalties, annoyance to, or interference with, the public while reasonably exercising their rights.

"If any riparian owners or occupiers persist in claiming alleged Private Rights in antagonism to the Public, we respectfully submit that all such claims should be carefully and properly investigated by competent impartial authority, before the same are allowed. It is much to be regretted that this was not done before the later Thames Acts were procured by the Conservators, in which clauses regarding alleged private rights have been introduced, which we respectfully contend are open to serious objections in the interests of the public.

"We further submit that every riparian owner or occupier, whether a member of the Board of Conservators or not, should be prohibited, whether as a magistrate, or in any other capacity, from adjudicating upon claims by any other riparian owner or occupier opposed to public rights.

"If the river is public, those who use and enjoy it, as of old, ought not, in our view, to be annoyed or proceeded against for using it. If the river is private, we fail to understand why the Conservators should have obtained powers from Parliament to protect and preserve it, and to improve the fishing for the benefit of claimants of alleged private portions of the stream, or why the public should be taxed, and its money spent for such purposes.

"As regards the tow-paths, they could probably be purchased now for far less than they would cost later on, when the value of building frontages, &c., is likely to increase.

"We understand that claims have been made by some riparian owners below Staines, for instance, at Thames Ditton and Walton.

"We regret to observe from the Conservators recent replies to the inquiries made by Mr. Cook, and by the Common Council of the City of London, that the Conservators contemplate leaving the public unprotected against attempts at usurpation by riparian owners and occupiers, and we now beg to ask whether the Conservators, upon an instance, or instances, of infringement of public rights on the river, being laid before their officers, supported by proper evidence, will or will not interfere to protect the public rights.

"We trust that, upon further consideration, the Board will

decide to support and uphold the rights of the public, and thereby add to the kindness which has heretofore been shown by the Conservators and its officials to anglers and other frequenters of the river.

"From various causes we have been unable to forward this communication earlier, for which we beg to apologise.

"On behalf of the Thames Rights Defence Association.

"11, Old Jewry Chambers, E.C., February, 1881."

ANNUAL DINNER OF THE PISCATORIAL SOCIETY.

IT has now become an institution for the members of the Piscatorial Society to hold their annual dinners in the Prince's Salon at the Holborn Restaurant, and the month of February in each year is looked forward to with increasing interest for repetitions of the event. In this popular dining establishment these dinners are always regarded as the great banquet of the year, and the management gives them marked and special attention. The Piscatorial Society, which dates its origin from the year of grace eighteen hundred and thirty-seven, has risen to the highest eminence as an angling club; and at the present time has no rival as an active and useful society. No matter whether it is in helping to frame a Freshwater Fishery Act, to discuss the question of private rights on the Thames, to restrain, if possible, the dangerous speed of steam-launches, or other matters of similar importance to the general constituency of anglers, it comes forward at the right time to ventilate each question and moves them in the right direction. It thus becomes a leader to all that is desirable in the interests of angling, and it is eminently fitted for such a position, from the undoubted fact that enrolled amongst its list of members are the names of some of the best and most thoroughly practical anglers in the great city of London. It would be difficult to enumerate them all, yet there are those to whom most piscators are familiar, such as Jardine, Sachs, Rolfe, Gillatt, Pearce, Goodger, Nicholay, Wheatstone, Knechtli, Blamey, Perelli-Rocco, Huggett, Hare-Winton, Lemann, Wheel-don, Adlington, Lovelock, Pattison, and a host of others. It is no wonder, then, that the Annual Dinner is regarded as a big event, and that the Prince's Salon, which seats one hundred and twenty, necessarily limits the attendance to that number. When the Holborn Restaurant possesses a much larger room amongst the improvements and additions which are now being made, the number of guests will be as largely increased, for it is at present the only regret of the members that the accommodation, large as the number now is, should be limited, and they will go nowhere else to hold their annual banquets. It was at one of the annual dinners of this society that the late Mr. Frank Buckland first intimated the fact that on that particular day he had received his appointment as one of Her Majesty's Inspector of Salmon Fisheries. Formerly it was the custom on these occasions to distribute the prizes that had been won by the successful competitors during the previous year; but this has for several years been abandoned, owing to the large amount of time required for such a purpose; the Committee wisely postponing it to the next weekly meeting of the society, in the club room at Ashley's Hotel, Henrietta Street, Covent Garden, it being made special for such an occasion. Amongst the surviving founders of this society are Mr. F. G. Pearce, the respected treasurer, and who has all along taken a lively interest in the progress and growing prosperity of the Club, and Mr. J. Mann, and who is also the oldest surviving member of the first volunteer force enrolled in this country. As a proof of the energy and zeal of Mr. James Lander, the hon. secretary of the society, he was presented at the last annual meeting with a complimentary honorarium of twenty pounds, and there can be no doubt that during his years of office the success of the Club has

become due to his unwearied exertions, and it is to be hoped he will long continue to hold a position for which he is so eminently and practically qualified. The announcement that Mr. Arthur Otway, M.P., had consented to take the chair on this occasion, and that he would be supported by Mr. McLaren, M.P., invested it with particular attraction, in addition to the society being represented in the vice-chair by Mr. Thomas Huggett, one of its most useful and practical members. The assembling of the guests in the spacious saloon, enriched as it is with plate-glass walls and gold embellishments, together with a series of elegantly laid-out dining tables with floral decorations, presented a scene which would baffle description. The arrangements were perfect and complete. Each table branching from the long centre, or chairman's table, was presided over by Messrs. Alfred Jardine, F. H. Lemann, B. Perelli-Rocco, T. Gillatt, H. Gray, and C. P. Wheatstone; the middle one, in a line with the chairman's seat, being occupied by the vice-chairman, Mr. Thomas Huggett. In order to prevent any confusion the presiding genius over each table was made responsible for his guests. Mr. Alfred Jardine, the champion pike-fisher, exhibited his case of two monster pike of 37 lb. each, caught by himself, exquisitely preserved by Mr. Saunders, and it can be no doubt there is not a similar case evidencing an angler's skill in the capture of the two such remarkably fine specimens in the world. This gentleman had also a fine specimen of a lump-fish of 17 lb. There was a very large attendance of members and friends, including, in addition to the chairman and vice-chairman:—Messrs. McLaren, M.P., F. G. Pearce, T. Spreckley, T. R. Sachs, T. Gillatt, B. Perelli-Rocco, H. Gray, James Lander, T. Marsh Brougham, F. H. Lemann, Harrison, A. Nuthall, Alfred Jardine, H. L. Rolfe, J. A. Nicholay, J. W. Gant, D. Goodger, J. G. Addrews, W. A. Maloney, G. H. Thurston, C. P. Wheatstone, Lodge, Clemow, T. Pattisson, W. Jarvis, Elliott, W. H. Brougham, J. P. Wheeldon, R. B. Marston, Small, &c., &c., in all about 120 guests. The chairman, Mr. Arthur Otway, M.P., having proposed "The Queen and the rest of the Royal Family," in a thoroughly loyal speech, which was as loyally responded to, Mr. James Lander, the honorary secretary, read the annual report which, whilst it congratulated the members on the position of the society, as regards the number of members and its financial character, observed that the total weight of fish shown during the last year was less than the previous one, doubtless owing to the great increase in the limit for size, to fewer members being registered, and to exceptional floods. The quantity of fish weighed-in was 1421 lb. 8 oz. from public waters, and 414 lb. from private waters, making a total of 1835 lb. 8 oz. Out of £71 14s. offered in prizes, £62 13s. was won by the members, and which are to be distributed in the Club-room, Ashley's Hotel, Covent Garden, on Monday evening. The Chairman gave the toast of the evening, "Success to the Piscatorial Society," which he did with great sincerity. He looked upon himself as their honoured guest, but he could not help thinking they might have selected some one else better able to speak of the virtues of the Society. He was, however, pleased to find it was in a most flourishing condition, and if the members had exhibited a less quantity of fish, it was perhaps due to the increased intelligence of the fish, who had shown themselves up to certain dodges, and they were not such fools as they looked. The fish were therefore entitled to great congratulation. As for himself, he thought the more he knew about the fish, the greater was his esteem for them, though he should not like to come into contact with one of those monster specimens which were exhibited in Mr. Jardine's splendid case. He regarded fishing as one of our oldest recreations, and old as the connection was between men and fishes he hoped the relationship would long continue. The prolific capacity of fish

was undoubtedly great, and everything that could be done for the benefit of anglers should receive every attention of the legislature, whether as regarded the assumption of private rights and the prevention of steam-launches disturbing their pleasure, and his advice to the anglers was that they should endeavour to maintain all that really belonged to them. The toast was drunk with great applause. Mr. W. A. Malony then briefly gave "The Officers and the Secretary," referring in complimentary terms to Mr. F. G. Pearce, as Treasurer, Mr. H. Gray, as Librarian, and Mr. James Lander, as Hon. Secretary, whose name he associated with the toast and each of those gentlemen having given a short reply, Mr. McLaren, M.P., proposed the toast of "The Press," in which he referred to its progress in the past, and its value in the present day. There was a large amount of super-human labour attached to those who worked on the Press, and it was astonishing the facilities exhibited in the parliamentary reports, as in a division that afternoon, he found, in coming to the dinner, two hours afterwards it was in the evening papers. He coupled with the toast the names of Mr. T. P. Wheeldon and Mr. Smale, and those gentlemen having respectively replied, Mr. Alfred Jardine gave "The T.A.P.S. and Kindred Societies," referring to the great advantages the anglers derived from the preservation of rivers, and, although the preserved waters were more hardly fished—where there used to be one there was, perhaps, 1,000 now—the fishing had not been much diminished. There was a good stock of fish in the Thames. After some further remarks, which were full of practical humour, he told the chairman he knew of the whereabouts of a 50-lb. jack, and if he would accompany him, he would lend him a rod and show him how to catch it. The Chairman calling out "Bargain," which Mr. Jardine accepted. He coupled with the toast the names of Mr. Thomas Spreckley, of the T.A.P.S., and Mr. Elliott, of the Tunbridge Angling Preservation Society. Mr. Thomas Spreckley said it was a pleasing thing to be there that night to hear the remarks he had done; he himself took great interest in the matter of angling, which was simply in its infancy. He felt the success of his society was a kind of ruling power to kindred associations which were continually writing for advice. The Thames, to the London anglers, gave great joy and solicitude; he valued more their going-in for specimen fish than taking away large quantities. They had on their committee two gentlemen who had accepted deputations to act as river-keepers; he referred to Mr. Alfred Nuthall and Mr. P. Geen, who were ready to assist the men whether it was day or night. He concluded by referring to the willingness of the Thames Conservancy to assist in the removal of any evil whenever they were properly approached. Mr. Elliott briefly replied. Mr. Thomas Huggett, the vice-chairman, thought there had been some omission in not including the name of Mr. W. H. Brougham, in his connection with the *Field*, and Mr. R. B. Marston, of the FISHING GAZETTE, and hoped he would not be considered presumptuous in asking them to drink the health of those gentlemen, which was done in the most enthusiastic manner. Mr. W. H. Brougham remarked that as regards himself he felt the fault, if there was one, was more his own, as he had specially pleaded for a quiet evening. He had for so many years been called upon to reply to the toasts of the "T. A. P. S." "the Press" and sundry others, he imagined his position coming before a Justice of the Peace with so many aliases, would be sure to get a conviction against him. He, however, heartily thanked them for their warm recognition of his name, and his friend, Mr. Huggett, for so kindly introducing it. Mr. B. B. Marston, in some appropriate observations, thanked them for the compliment that had been paid to him. The remaining toasts were "the Chairman," "the Vice-chairman," and "the Visitors." Mr. Pearson, as the professional vocalist, afforded the company a great treat in his

splendid rendering of "My Pretty Jane," and other songs; and Herr Edouard Friederichs at the pianoforte, in two solos, and as an accompanist, evidenced the highest attainments as a musician.

CORRESPONDENCE.

[We do not hold ourselves responsible for opinions expressed by our Correspondents.]

ANSWERS TO CORRESPONDENTS.

HENRY EDWIN PIERCE (Windsor).—The jaw-bones of a fish found near Wraybury Fleet have been sent on to Mr. J. H. Keene, and he replies to your letter as follows:—"The jaws are unquestionably those of a member of the *Cyprinidae*, or its sub-division the *Leuciscine* family. The jaws of the chub are usually five and three teeth on each side, but sometimes five and two, as in the present case, owing to the easy fracture of the third small tooth. The carp has five and four teeth, and I think it is extremely probable that the jaws are those of about a six-pound carp (*Cyprinus carpio*). There are indications of a fracture of a secondary tooth on one of the jaws, and in view of this fact I cannot precisely determine whether they belonged to the chub or ordinary carp. I incline, as before indicated, to the opinion that they belonged to the latter fish."

DACE AT TEDDINGTON.

SIR,—Having heard Mr. Brougham's very lucid speech at the committee meeting of the West Central Association on Friday the 4th instant, I am very pleased to find that the Thames Angling Preservation Society are continuing their good work by stopping the fishing from the lock island and weir at Teddington during the time the dace are working upwards, as, if such fishing is allowed, I can well understand the term "merciless" being applied to it. An ardent angler has informed me that when the dace were working last season numerous so-called anglers took as many fish in a foul manner as they did otherwise. Of course not being present myself I can only give you the statement as I received it, but I have no reason to doubt its accuracy. He also states that no river keeper was present. As the puntmen cannot be stopped from fishing fairly in the spot mentioned during this interesting period, may I venture to suggest on behalf of myself and many brother anglers that a river keeper be told off for the special duty of preventing the nefarious practice of "snatching." If this is done I feel sure that the T. A. P. S. will earn the gratitude of every true sportsman.—I am, &c.,
VORTEX.

FISHING AT WINCHESTER.

SIR,—Allow me to draw your attention to the first article in last Saturday's FISHING GAZETTE, signed "Thomas Huggett." A more misleading production for stranger fly-fishermen it is impossible to conceive, and a contribution most damaging to your paper. Hammond has lost a portion of the Barge meadow now held by a most respectable man, Chalkley, the taxidermist, who deals in flies and fishing-tackle. The St. Cross water is now held by Mr. Cox, the gunmaker and fishing-tackle dealer, and whose wife is the most painstaking person I know to get flies carefully and correctly tied for her customers. From the St. Cross water there are some lengths strictly preserved in the Itchen proper, over which Hammond has no right whatever, but I believe he assumes a right in the canal which the fishermen here set at defiance! Sir W. Heathcote now claims this length, and John will get into trouble should he send his ticket-holders into the lower waters. John has a small meadow between Shawford and Brambridge; perhaps two, but to talk about "four days' good" fishing, may be as well read four hours. Three men who read Mr. Huggett's letter in my presence all said "If the FISHING GAZETTE publishes such misleading and unreliable rubbish, the sooner it shuts up the better."—I am, &c.,
RESIDENT.

Winchester, Feb. 8, 1881.

[About eight or nine years ago we fished Hammond's water at Winchester, and were perfectly satisfied with our sport. We have not been there since, and as Mr. Huggett's account of the water, &c., is quite correct, as far as we remember, we presume that there have been some recent changes. Hammond was very civil to us, and we have found his flies kill well, not only in the South of England trout streams, but also in those of the North. Mr. Huggett has done good service in drawing attention to Winchester as good head-quarters for trout-fishing, and of course if there have been changes since his visit he will be obliged to "Resident" for pointing them out.—ED.]

A PERSONAL MATTER.

SIR,—The "Raven's" last letter on this subject is an even more surprising, not to say saddening, production than his previous attempts. I do hope he is not writing merely in the spirit which he attributes to me, of "trying to have, woman-like, the last word." That he should have been capable of conceiving such an idea, gives a very pretty insight into the motives by which he himself may be moved. Not that I would impute motives: that I consider cowardly.

This last rignarole of our friend's is merely an attempt to run a kind of metaphorical red herring across the scent. I accused "Raven" of having falsely attributed to me two expressions. The first was that I spoke of "parr with almost white-coloured fins;" this, "Raven," in his last, calls a "quotation." Heaven save us from such quotations! Of the whole clause, the only words to be found in the original are "with" and "fins," and "Raven's" very lame explanation of this is, first, to lay the blame on the printer (wouldn't the cat have done as well?) for suppressing the word trout, and then by saying he might have written the word "whole-coloured." This explanation (!) does not mention how the words "parr" and "almost" made their appearance. As to the other point, "Raven" accused me of writing that "Yarell was describing the samlet under the name parr." Now, whether this were true or not, I never said so, and my anonymous friend, well knowing this to be the case, tries to sink off under cover of a cloud of ink, attempting to lead me away from the main charges by an accusation of which the least examination must have shown him the groundlessness, viz.: that I "persisted in using the words parr and samlet of the same fish." This I last week proved untrue, so this time I am arraigned for using the term parr, which I chose expressly because it was put as the heading

to "Raven's" first letter on the subject. If I am not to be allowed to apply either name to this imaginary fish, would "Raven" kindly tell me which of the following three names (all giving due honour to the only person who seems to have ever seen the creature), viz., *Salmo Corvenis*, *S. Ravenensis*, or *S. Humbuggii*, he prefers? I should suggest the last.

As to the major part of "Raven's" letter, it is simply an attempt to renew a controversy, which you, sir, have decided must end, by a side wind; and I shall not allow myself to be misled into so doing by the pernicious example of another. The "Raven" may consider such conduct honourable; but I have my own ideas on the subject. I shall, therefore, only point out that he again makes a false accusation against me of making "a wholly untrue statement, for parr and parr-marked fish are found abundantly where migratory salmonids are absent." Had I made this statement, I should have been quite correct, except as regards parr-marked fish; but I did not make it, for, in the paragraph referred to, my words were, "there are always other salmonoids of some kind." I said nothing about parr-marked fish, and I specially avoided the word migratory, as I was presupposing that the parr was a distinct fish, for the purposes of argument. Therefore this is a good sample of "Raven's" disingenuous—not to use a harder word—habit of misquoting what has been said. I had till now given him the benefit of the doubt, but at last see with regret that such an opinion is no longer tenable; for such a succession of mistakes cannot be due to mere carelessness. As to his doubting my word, it is only natural to judge others by himself; but "facts are chieftains that winna ding." One parting word; the expression salmonoid, or salmonid if he prefers it, is applicable to all the salmon family, not excluding the true trouts, as "Raven" seems to imagine.—I am, &c.,
T. SPENCE.

THE RIVER LUGG, HEREFORDSHIRE.

SIR,—Knowing the Lugg to be one of your favourite streams, as also sure to be the same with many of your readers, and being moreover able to follow my friend "Benjamin" in the whole course of his description of that river, I have no hesitation in forwarding his letter for perusal by your readers, and it may suggest further information from some one or other of them.—I am, &c.,
P. F. DAVIS.

THE RIVER LUGG.

To the Editor of the *Worcestershire Advertiser*.

SIR,—As promised last week, I send your readers a description of the river Lugg. Beginning at the lower end, viz., Lugwardine, near Hereford, there is good general fishing here—pike, chub, and other white fish, as well as trout and grayling. Above Lugg Mills the water is pounded up for a long stretch until you reach the aqueduct; here the fords begin to show, and here is good fishing, the grayling, trout and dace being large, and good baskets may be caught. Leave may be had here. Withington parish and up the stream to Moreton station is capital fishing. There is a club on the water from here up to Bodenham, and on to Dinmore right up to England's Gate, near Hampton Court, which is preserved by Squire Arkwright, who owns the water and land up to and above Ford's bridge station. Leave may be had about here and up to Leominster, where the town water is between this and the next preserved stretch of water, up to Kingsland. There is a club here. The tariff is high, the proprietor and keeper, Mr. Williams, keeping it very select for gentlemen only. Going on up stream there is no white fish—only trout and grayling, and some splendid specimens are often taken. Higher up to Mortimer's Cross, is the Rev. Kepple Davis's water, which is strictly preserved, and excellent fishing is obtained by a few friends of the proprietor. Higher up stream to Amstey, the fishing is still strictly preserved, and all in private hands. Then comes Lord Bateman's waters, with keepers living on the banks of the stream, which is preserved for angling alone, and highly valued is the fishing about here. On up stream to Shirley and Kinsham is the upper end of this river, where grayling abound. It is comparable to Leintwardine on the river Teme, as higher up stream there are no deeps and suitable water for this splendid fish to congregate, but trout abounds in great quantities where strict preservation is put on, the water keepers being on all this river as far as and above Presteigne, and up through Radnorshire. The proprietors think more of the fishing than shooting, so that there is no free or club water like there is on the river Severn, but of all the rivers that I know—and I have fished in, the river Dove, in Derbyshire, and in a great many rivers—there is none like the river Teme, and if old Isaac Walton had angled in the Teme much, he would, no doubt, have given his verdict for that splendid stream instead of the Dove. There is a very good tributary of the Lugg, called the Arrow, which runs into the Lugg about a mile below Leominster. This river contains trout, grayling and white fish as high up as Eardisland; higher up, only trout and grayling, the latter ceasing to go higher up in any quantity above Pembridge, but up stream to Staunton-on-Arrow and Titley, and on up to Kington is considered the best trout stream in that country. There is a club on this river called the Kington Club. The club water extends from Huntingdon, five miles above Kington Downs, to Titley, about 10 miles of water. Fly-fishing and spinning only is allowed. The tariff is moderate, and the town and railway accommodation is near it. There are some good small streams about here, within a few miles of Worcester, viz.: the Spedsborne and others, that rises out of the Lickey and other hills north of Worcester, and runs into the Severn. It contains capital trout and white-fish. A good fishing station is at Hadley Bowling Green, where leave can be had, and if the fish do not sport freely, the parties can enjoy themselves on the bowling-green, there being no nicer more or cosy place for a small tea-party.—I am, &c.,
Feb. 7.
B. SMITH.

THE PEACOCK-FLY IN AUSTRALIA.

SIR,—Will it be troubling you or any of your readers to inform me what the above, mentioned in your last by Dr. Brunton, is like? I know of a peacock-fly given in "Ronald's Fly Fisher's Entomology," but that is quite small, and I should not think a trout would take it for a minnow as it is nothing like one. Would it be the "Alexander"? this fly is most like a minnow that I have yet seen—wings several strands of a peacock's feather, about 1½ inch long, dressed flat, and a silver body. I have used this fly for large trout that seldom rise, and found it very killing, especially when let sink and given the short jerking movement that a natural minnow has. Dr. Brunton remarks that there are no minnows in Australia; would there not be trout fry? if so, it may possibly account for the peacock fly being taken freely.—I am, &c.,
Hastings.
H. B.

ANGLERS' BENEVOLENT SOCIETY.

SIR,—Greville Fennell, Esq., having presented two handsome paintings for the benefit of the funds of the above society, the committee have decided to dispose of them by a draw on the Art Union principle; the tickets are one shilling each. Should any one require tickets, I shall be pleased to forward them on application. All tickets unsold must be returned on or before Friday, March 11th, with a remittance for all sold, as no tickets can be drawn unless previously paid for. The draw will take place under the direction of the committee, the result of which will be published in the sporting journals.—I am, &c.,
R. GHURNEY,
10, Baches Street, Charles Square, Hoxton, N.

QUERY.

SIR,—Can you or any of your readers give me particulars of a work published in parts, called the "Practical Fisherman;" and also I should be glad to know of any Fishing Club near Canterbury.—I am, &c., CYPRINUS.
[You can get the work at the "Bazaar" Office, Strand, London.—ED.]

CLUB REPORTS.

ALEXANDRA SOCIETY OF ANGLERS.

The annual supper of the above club took place on Monday, Jan. 31, Mr. G. Oram in the chair, Mr. C. Newton, vice. The supper was served in splendour by Mr. Clark, assisted by Mrs. Clark, host and hostess; Mr. Waterman presided at the piano, and played some excellent music during supper and during the evening. Among the visitors were Messrs. B. Hymns, G. Hymns, J. Haggett, Ghurney, T. Morgan, Maybury, J. Hussey, E. Brocket, jun. Several prizes were given during the evening by the following gentlemen—Messrs. J. Hussey, E. Brocket, J. Morgan, W. High, Maybury, and J. Blackledge. The first toast of the evening was given by the chairman, "Success to the Alexandra Society; the next "Health and Prosperity to Mr. and Mrs. Clarke and all the Little Clarkes," cheers and three times three, Mr. Clark responded; next toast "Anglers' Benevolent Society," Mr. T. Morgan responded; T. Gripton, toast, very good. Several songs were sung during the evening by the following gentlemen:—Mr. C. Newton, "Louis Renouf"; Mr. G. Hymns, "Awfully Glad to see You"; Mr. W. Atkinson, "The Ring my Mother Wore"; Mr. T. Cole, "Maid and Magpie"; Mr. T. Gripton, "Long Parted Have we Been"; Mr. J. Morgan, "One More Glass"; Mr. J. Blackledge, "The Heart Bowed Down"; Mr. J. Haggett, "Tom Bowling" and "Spider and Fly"; Mr. Maybury, "Musical Academy at New York"; duet by Mr. J. Haggett and Mr. G. Hymns, "Larboard Watch"; Mr. B. Hymns, "John Brown"; Mr. G. Hymns, "Johnstone's Christmas Party"; Mr. E. Brocket, jun., "Men Mowing Hay" and "Jack's Yarn"; Mr. R. Clarke, "Cottage by the Sea"; Mr. W. Osborn, "Simon the Cellarer"; Mr. J. Haggett, "The Wolf"; and Messrs. W. High, E. Brocket, jun., and B. Hymn, "Afloat on the Ocean. The meeting now broke up, it being two o'clock, everyone having expressed himself quite satisfied with the evening's amusement. On Feb. 6 Mr. C. Hewett just saved us from a blank with roach.—C. HARTLAND, sec.

THE ANGLERS' PRIDE.

On the 6th inst. the members fished for a set of weights and scales given by Mr. Perkins, a member of the Great Northern Brothers. This gentleman gave a similar prize last season, and on each occasion the members have fished for it; jack only to weigh. Some fine jack were exhibited, and the result gave great satisfaction. The following are the names of the members who weighed in:—Mr. Hayes, one jack, 5 lb.; Mr. Mallett, ditto, 4 lb.; Mr. Dealy, ditto, 3 lb. 12 oz.—THOS. FIDDES.
Dec. 8.

BATTERSEA PISCATORIAL SOCIETY.

Several members of this society were out on Sunday last, and considering the state of the water they met with very fair success. Mr. Greener with 5 lb. 6 oz. of roach and dace from Twickenham; Mr. Hines, 3 lb. 8 oz. of roach and perch from Sunbury; and Mr. Wilson, 3 lb. 5 oz. roach from Richmond.—C. NEWMAN, hon. sec.

CITY OF LONDON ANGLING SOCIETY.

One member weighed-in, on the 6th, Mr. Castell, some fine roach from the Roding. We fish on the 13th at Watford for prizes given by Messrs. Fowler, Castell, and Mortimer.—CAS.

CLAPHAM JUNCTION ANGLING CLUB.

The members of this society intend going in actively now after having such a long rest; and very little fish being weighed-in, there are several prizes to be competed for before the close of the season. It is requested that all members should attend on Thursday, Feb. 17th, for important business, W. Anthony having promised to bring home one of the long looked-for bream for approval of members.—E. WILSON, sec.
Feb. 9.

THE EAST ANGLIAN PISCATORIAL SOCIETY.

A special meeting of this now flourishing society was held at the club-house (Host Palmer's) on Tuesday last, when several items of importance were discussed. Brother C. S. Fowler was elected chairman for the ensuing half-year, and Bro. W. G. Capon vice. The pike-fishing match is arranged to take place the last week in the present month (weather permitting). Bro. W. G. Capon (the eminent fishing-tackle manufacturer, of Norwich) offering a very handsome prize, value a guinea, for competition. J. W. Wellington, Esq., also offers another prize, value two guineas, for the largest fish; whilst several other prizes are promised. Altogether, this match promises to be a very decided success, and will be the first of the kind ever held in these parts—the match of the Norwich Angling Club following closely on. The nights of meeting are to be in future the last Thursday in each month, instead of the first Tuesday as heretofore, so that we may not clash with other clubs. Several new members were elected.

EUSTONIAN ANGLING SOCIETY.

Some of our members went out on Sunday last to fish for a prize given by Mr. Hornfeck, Mr. Jones being the winner, with roach from West Drayton. Messrs. Stedman, Wink, Neal, and Lawrance had roach and dace.—WM. COLTER.

GOLDEN BARBEL ANGLING SOCIETY.

On Friday the 4th Mr. J. Green paid a visit to his beloved spot on the Thames and managed to get some popes, gudgeon, and roach, the latter being alone weighable in this society. On Sunday the 6th he again returned to his favourite swim, and succeeded in getting some roach and perch, which enabled him to win $\frac{1}{2}$ lb. of tobacco. On the same day Mr. T. Bigsby visited Reading, and had some sport among the chub, but he only managed to bank one, the interest of which amounted to $\frac{1}{2}$ lb. of tobacco also. The following addition has been made to the piscatorial trophies, which decorate the wall of the clubroom. A tench weighing $3\frac{1}{2}$ lb. taken by Mr. Entwistle, and a bream $3\frac{1}{2}$ lb. taken by Mr. Rogers; both these fish have been preserved by Mr. J. Lancaster of Camden Town. On the 8th I visited this society and was pleased to see the manner in which the response, was made, to the appeal made on the behalf of the widow of poor George Foster. A few words as to my knowledge of him, such as my poor ability will allow, might not be out of place. I always respected him, and was very sorry to hear of his death, and the painful condition in which his wife and family are placed. I first made the acquaintance of George at the Sir Robert Napier, New-inn-yard, Shoreditch, where we, with several other gentlemen appointed by the various London Angling Societies, met to form the then called "Central Committee of London Anglers," and for five years, or about, we attended and returned home together from nearly every meeting called by that committee. During that time I always found George Foster ever ready to devote his time (and at times he could ill afford to do so) to forward the cause of angling and anglers; for the former in assisting the River Lea Preservation Committee, and the latter in helping to get what is now well-known as "The Angler's Ticket" on nearly all railways in London. I also must say that if ever an appeal was made to him on the behalf of a brother angler, or his widow, who was in distress, it rarely, if ever was made in vain. Therefore I do hope and trust that the appeal which is now being made on the behalf of his wife and family will meet the warm support of all anglers and their friends.—PIXIE.

February 10, 1889.

GOOD INTENT ANGLING SOCIETY.

The members of this club held their annual supper at their club-house, the Crown Inn, Church Street, on February 1st; chairman, Mr. W. H. Beckett; vice, Mr. H. Courcha. Over 100 members and friends sat down to a most excellent supper, provided by our worthy hostess, Mrs. Roberts—everything plentiful and of the best quality. After the cloth being removed, the usual loyal toast being given, then the Chairman gave "The Good Intent Society," the Secretary, Mr. R. Murphy, responded; then followed "The East and West Central Association," most ably responded to by Mr. Ghurney, Mr. S. Morgan, and Mr. Bonvason; then the health of our worthy hostess was received with musical honours; and wound up with a long list of prizes being given to the club, the donors being Mr. W. Wright, artist, Bethnal Green Road, portrait, value £5 5s.; Messrs. W. Roberts, H. Courcha, Groom, W. Smith, A. J. Wheeler, J. Julier, Beckett, Murphy, Pluckrose, C. Edwards, H. Brockwell, and a host of others. Harmony prevailed till 2.30 a.m., every one delighted with their enjoyment.—R. MURPHY.
Feb. 8.

GREAT NORTHERN BROTHERS.

We fished at Watford on Sunday last for ten prizes and a sweepstake. The weather was fine but cold, and the fish dead off, consequently the takes were very small. On weighing, the following proved the winners:—first, Mr. Parker; second, Mr. T. Watling; third, Mr. Smith; fourth, Mr. Cherry; fifth, Mr. Theobald; sixth, Mr. Young; seventh, Mr. C. Warren; eighth, Mr. Perkins; ninth, Mr. Page; tenth, Mr. Grinham. Sweepstake—First, Mr. Parker; second, Mr. T. Watling; third, Mr. Smith. The following members also weighed-in fish:—Messrs. Walker, Stammer, Pica, Reynolds, Fitch, Jennings, Burstow, Cowper and Beeston (Old Joe). The splendid bream (one weighing 6 lb. 9 oz.) taken by Mr. Theobald from the river Wey are now to be seen at the club-house, Robin Hood, Southampton Street, Pentonville.—J. FITCH, jun., sec.

February 8th.

HAMMERSMITH UNITED.

Despite the snowy water, three of our members ventured out on the 6th, and fishing in the tideway were successful in catching some dace, roach, bleak and perch. The water was falling rapidly, and if we get no more snow or rain it will soon fine down, so there is a prospect of a little fishing before the end of the season.—VORTEX.

IZAAK WALTON ANGLING SOCIETY.

Mr. C. Morrow had some handsome roach and perch on Sunday last (6th inst.) His heaviest perch weighed 1 lb $3\frac{1}{2}$ oz., and was a very pretty fish. Messrs. A. Salmon, T. Dennison, and J. Hilliar, jun., had roach this day. Three special prizes will be fished for on Sunday, the 13th inst. All fish weighed according to the society's rules; members to choose their own fishing water; no competitor to leave London before 5 a.m. on the morning of the competition.

Feb. 9, 1881.

LARKHALL ANGLING SOCIETY.

This Society is largely increasing in numbers; there were three members elected to-night, all thorough good fishermen; and I have no doubt, as soon as the water goes down a little, there will be a good show of fish, as the members are all anxiously waiting for the first opportunity—not having dipped a line for several weeks, except in the water-butt, to keep the lines moist.

Feb. 9.

W. H. DABCHICK.

THE LITTLE INDEPENDENT ANGLING SOCIETY.

Several of our members tried their luck on Sunday last, but the takes were very trifling. Those successful were:—Mr. Scott, roach; Mr. Hurwood, roach;

Mr. Watts, roach; Mr. Hopton, roach; Mr. Wightman, dace. Our district return visit will take place at the Russell Arms, Bedford Street, N.W., on Tuesday, the 22nd inst.—W. BROWN, hon. sec.
February 9th.

TIVERTON FISHING ASSOCIATION.

The general annual meeting of the above association was held at the Angel Hotel on Tuesday last, Mr. W. T. Waldy in the chair. The accounts for the past year being read, showed a balance in hand. Mr. T. C. Daniel was re-elected president, Sir J. Heathcoat-Heathcoat Amory, Bart., M.P., secretary, and the committee, with the exception of Capt. Davis, in whose place Major Vialls was elected, were re-elected. This having been carried, it was unanimously resolved, on the motion of the Rev. G. W. Owen, seconded by Mr. Wrattislaw, that Mr. W. T. Waldy be elected vice-president for the present year. Messrs. W. T. Waldy and T. O. Lazenby were re-elected supervisors, and Lee keeper for the lower water; and Messrs. W. Leir and J. Barne, supervisors, and Lazarus and Hawkins keepers for the upper water. Power was given to the committee to take the tickets of any member infringing the rules. On the motion of Major Vialls, seconded by Mr. A. L. Francis, it was resolved that the season commence on the 14th inst., and end at the usual time. Season tickets, only issued to residents 30s.; to others two guineas.—P.S.—The Exe is very high, snow going away nicely.

READING AND DISTRICT ASSOCIATION.

In consequence of its length we are compelled to leave the 1881 Report of the above society over until next week.

NORWICH PISCATORIAL SOCIETY.

A general meeting of the above society took place on Tuesday, February 1st, at the club-house, the Walnut Tree Shades, on which occasion the Rev. Mr. Matthews, B.D., gave a most instructive and interesting reading. Subject:—"His experiences of Fishing in North America." A large attendance of members and friends took place, and a most enjoyable evening was passed. Notice was also given that the club-room would in future be open three nights each week for the use of members and friends, and also a "Catch-book" would be placed in the room, so that members could enter their respective catches each time they went out, and Host Palmer announced that he had been promised a prize for the best "takes" during the next six months. A vote of thanks to the chairman was then passed, and the meeting ended. P.S.—I will send a detailed account of the reading next week.—ANGLER.

ST. JOHN'S.

Several of our members were out on the 6th, but we had no fish in the club-room owing to the quantity of snow water in the rivers. We propose having a complimentary return visit on Monday, March 7th. As this will be the first visit we shall have at our new quarters, we shall be glad to see our old friends on this night, as we have a first-class host, who takes an interest in angling, and a first-class house with every convenience. Meeting nights, Friday and Sunday.—F. THORLING.

February 7th.

WALTONIAN ANGLING SOCIETY.

A few of our members were out on the 6th. Mr. Greenfield had 3lb. 14 oz. of roach from the Lea. Mr. Rushbrook just saved himself a blank with one roach from Pangbourne.—A. J. MARRIOTT.
Feb. 7th, 1881.

NATURAL HISTORY.*

FOOD OF YOUNG FISHES.

I CANNOT learn that anything has been recorded respecting the food of young fishes in this country,† nor have I been able to find any evidence that this subject has been systematically studied in Europe, in such part of the ichthyological literature of Europe as is accessible to me. From the translations of papers published in the appendices to the Report of the United States Fish Commissioner, I learn that the artificial use of entomostraca for the food of young trout has been successfully attempted in France. I also find in the bulletin of the Society of Acclimatisation of Paris a statement to the effect that, in the Russian governmental establishment for the cultivation of fishes, young trout and other valuable species are fed with beetles and insect larvæ obtained from stagnant water by means of a small muslin net. Although the use of entomostraca is not specially mentioned in this extract, yet they must, of course, be obtained in the search for insect larvæ.

That this subject should not have been long ago thoroughly investigated seems a surprising fact, when one considers the vast amount of labour which has been spent upon fishes as a class, and reflects for a moment upon the interest to science and to practical fish culture of a knowledge of the food resources of fishes and of the competitions of the various species in the search for subsistence.

Although I cannot yet treat this subject as it fully deserves, the results of such study as I have been able to make during the past season of the contents of the stomachs and intestines of small specimens seem to justify this preliminary notice.

It was early apparent, in the course of the investigation, that the food of many fishes differs according to age; and it was soon found that the life of most of our fishes divides into at least two periods, and many into three, with respect to the kinds of food chiefly taken. Further, in the first of these periods, a remarkable similarity of food

was noticed among species and families whose later food habits are widely different.

The full grown black bass, for example feeds principally on fishes and crawfishes, the sheephead on mollusks, the gizzard shad on mud and algae, while the catfishes are nearly omnivorous; yet these are all found to agree so closely in food when very small that one could not possibly tell from the contents of the stomachs which group he was dealing with.

It is my purpose in this paper to give what facts I have relating to the food of our freshwater species during this first period of the fish's life, avoiding technical details, and mentioning only the general results of the investigation.

The facts are derived from the examination of one hundred and twenty-six specimens, ranging from three-eighths of an inch in length up to an inch and a half, and in a few cases to two and three inches. These specimens belong to twenty-four genera and represent eleven families. In two or three genera no specimens were obtained small enough to be regarded as belonging strictly to this first-food period, but the earliest food is nevertheless plainly inferable; and the general distribution and variety of the species studied is such that I think the main conclusions will be found to stand the test of full investigation.

PERCH FAMILY.

The food of a common perch, from an inch to an inch and a quarter long, consisted wholly of entomostraca and the larvæ of chironomus. The first of these names is applied to the minute crustaceans, which are found most abundant in lakes and other stagnant waters, but occur likewise, to some extent, in running streams. The name of water-fleas is sometimes given to a large section of this group. Chironomus is a small gnat whose larvæ is familiar to all who have ever noticed the minute animals of stagnant water. It has the appearance, to the naked eye, of a minute red worm, which moves through the water with a violent wriggling motion.

BASS FAMILY.

No very small specimens of the bass proper—that is, of white bass and striped or brassy bass—were taken by us, the smallest being a brassy bass an inch and a quarter long. Half of the food of this consisted of entomostraca, and the other half of minute gizzard shad.

SUNFISH FAMILY.

A group of 43 specimens of the sunfish family (which includes the two species of black bass) was made up as follows:—Of five specimens of black bass under three-fourths of an inch long, two of rock bass of the same size, two of goggle-eye from seven-eighths of an inch to an inch in length, ten of common sunfish from an inch to an inch and a fourth, nine pumpkin seed from one and a half to two inches, five of croppie one inch and under, four of poxomys from three-fourths of an inch to an inch and a half, and six indeterminate specimens, probably common sun-fish from seven-sixteenths to five-eighths of an inch long. Ninety-six per cent. of the food of these forty-three specimens consisted of entomostraca and larvæ of chironomus—seventy of the first and twenty-six of the second. The trivial remainder consisting of the larvæ of May flies and other similar insects, a young amphipod, with traces of water mites, water bugs and molluscs—the last taken by the pumpkin seed or bream.

PIKE FAMILY (*Esocidae*).

I did not have the good fortune to obtain any young of the common pike, and can only report on the food of a single salmon pickerel (*Esox Salmoeneus*) an inch and a fourth in length. This specimen, taken at Pekin, Ill., on the 2nd of June, had already begun its life labour of the elimination of little fishes, these making about two-fifths of its food. The remainder consisted of crustacea, composed about equally of young amphidoda, daphniidæ and Lynceidæ. The presence of so large a quantity of these minute entomostraca in the stomach of a pickerel of this size is sufficient evidence that they form the principal part of its food at an early age.

(To be Continued.)

TO ANGLERS.—W. J. Cummins, Fishing Tackle Maker, Bishop Auckland, is now prepared to forward to anglers his Illustrated Catalogue, which is not only a Trade List but is interspersed with practical hints, useful directions, and valuable information gathered by the river-side from twenty years' experience. The stock consists of his unrivalled Salmon, Trout, Grayling, and Pike Rods, Lines, Reels, Baskets, Artificial Baits, Fly-books, Landing Nets, Gaffs, and last, but not least, his celebrated Trout Flies, which for killing powers stand unequalled. Every article kept in stock is of the very best description.—[ADVT.]

GEORGE JAMES EATON, of Starkholmes Matlock-Bath, Derbyshire, respectfully invites Noblemen and Gentlemen to try his standard FLIES for the present season. No flies sent or made up but what he himself has proved sure killers. A trial is all that is required from gentlemen who can fish to prove whether they may be genuine or not. Patronised by some of the best fishermen of the day. All flies dressed on the best Kendal hooks. Prices: Point Flies, 2s. 6d. per Dozen; Dropper Flies, 2s. per Dozen. Orders punctually attended to.—[ADVT.]

HEREFORDSHIRE.—To be LET or SOLD, together or separately, a well-built detached HOUSE, containing Dining and Drawing-rooms, Study, six Bed-rooms, Butler's Pantry, Kitchen, &c., Coach-house, two-stalled Stable, and commodious outbuildings, large Garden in excellent condition, and orchard planted with choice table and cider fruit. The lawn skirts the Arrow, a noted trout and grayling river for 80 or 100 yards. Shooting also may be had. Soil gravelly. Five minutes' walk from church. Five miles from the Borough town of Leominster. Two from either Pembridge or Kingsland Railway Station. Also two COTTAGES with gardens, and additional stabling and barn. The premises occupy altogether about two acres. Seven acres additional land may be had if required. Apply to Mr. LLANWARNE, Solicitor, Hereford; or Mr. ELLIOTT, Grecian Chambers, Devereux Court, Temple London.

* As read at the meeting of the Central Fish Cultural Association on December 16, 1880, by S. A. Forbes.

† Perhaps exception should be made of a note relating to the occurrence of diatoms in the stomachs of two young whitefishes, published in the appendix to the Report of the United States Fish Commissioner for 1872-73, p. 57.

N O T I C E.

Communications relating to the Literary Department, Fishing Tackle for Notice, Books for Review, &c., must be addressed to the Editor of THE FISHING GAZETTE, No. 12, Fetter Lane, London, E.C. and should reach the office not later than Tuesday morning.

Contributions are solicited, but the Editor will not undertake to return rejected MSS., unless accompanied with a stamped addressed envelope.

Correspondents are requested to write on one side of the paper only and give their real names and addresses, not necessarily as signatures to their letters, but as a guarantee of good faith. Unless this rule be adhered to no notice will be taken of such communications.

THE FISHING GAZETTE is published every Saturday, and can be obtained at Messrs. W. H. Smith and Son's Railway Bookstalls, and of the following, amongst other Fishing Tackle Dealers in London and the Provinces:—

Messrs. Alfred and Son, Moorgate-street.
Messrs. Price and Co., 8, Seymour-street, Euston-square, N.W.
Messrs. Williams and Co., Great Queen-street.
Messrs. Gee and Co., St. Andrew's-street, St. Martin's-lane.

The Fishing Gazette.

SATURDAY, FEBRUARY 19, 1881.

THEORY OF ARTIFICIAL FLIES.

I THINK I may safely say that there are few things on which so many different opinions have been expressed as about which, among the numberless flies used to allure the trout, are the most tempting. Mr. Cholmondeley Pennell's theory is well known to

most anglers, but I do not think it has met with much approval at their hands. If his theory were adopted, it would certainly make fly-fishing much simpler, both to veterans and amateurs; but I am afraid the poor fly-dressers would rise up *en masse* in protest against it, as their means of getting a livelihood in the world would be thereby hopelessly put an end to. He advocates, as most fishermen are aware, the use of three flies only—"green," "brown," and "yellow"—and tries to prove, in his exceedingly interesting book on angling in general, that these said three typical flies are the only ones really necessary to the wants of an angler, and that all other flies are merely different forms of them. He himself has tested their efficiency against other flies on the chief lochs and streams of England, Scotland and Ireland, and in all cases he has never failed to equal, and often to exceed, the takes made by the most experienced local fishermen. This is a strong argument in their favour; but it must be remembered that the originator of this theory is a skilful angler, and where he did not fail to secure good takes with his three flies, others less skilled would probably do so. It seems, also, too great a revolution to cut down to three typical flies the numberless mites of the insect creation, and though doubtless it would be far better that fewer flies should be used by anglers in general than now are used, it seems a pity that the number should be restricted to three only.

In common with an increasing majority nowadays, I am in favour of the use of a few flies only, though with more diversity of colour than Mr. Pennell's. I think that a great lesson may be drawn from the following fact. In the course of a day's fishing the angler generally meets with one or more "brothers of the craft," all trying to allure the "monarch of the hook" with different flies on each of their casts. We will presume they are all pretty well skilled in the art. If the trout are rising, and willing to be caught, they will bear testimony to the fact by the contents of their baskets, but if the fish are sulky or lazy, then their baskets are considerably lighter than their hearts. It is the same in angling competitions, held in Scotland usually, when two first-class anglers, each employing different flies, engage in contests, and the usual result is, at the end of the time appointed, that their takes are very little different from one another. This shows, I think, that no hard-and-fast rule can be laid down about the number of flies that ought to be used, and which have precedence over others. There is also another fact that shows, I think, the uselessness of having, like many anglers, such a multitude of flies in their fly-books, differing very little from each other in appearance, and looking no different from one another in the water, and that is, that when a fly is in the stream its appearance is quite changed to what it is when dry; its colour fades, the brightness dies out, and altogether it looks a very uninviting morsel for a fish to be tempted into swallowing. For this reason, therefore, it would seem rather foolish for an angler to have so many flies, to distinguish which from which is a work of art, not so much for himself when looking at them dry, but for the fish, who see them presenting a dragged appearance in the water.

I agree partly with Mr. Pennell when he says that three flies are all that are necessary, but I do not think that his three typical flies are the best he might have chosen. A little more diversity of colour would improve them, and he might have added those with wings instead of hackles, although he tries to prove that wings are an incumbrance to "imitations," and should therefore be avoided.

Again, there is another instance which goes far to prove that trout may be taken by any flies almost, so long as they are neatly made and well dressed. If you send for a sample of any fly, say the "blue dun," to four different tackle-makers in the metropolis or elsewhere, you have sent you four samples of flies professing to be "blue duns," but which differ from one another in many

respects, one being dressed with white hackles, another with blue ones, one having yellow silk round the body, another dressed with a brown body altogether. It is the same also with other flies; those bearing the same names are often very differently dressed.

In conclusion, let me say that I think these instances prove that there are a great many flies used by anglers which are totally unnecessary, and that if about four of the best known were substituted for the dozens which fill many anglers' fly-books, it would be a great change for the better.

BLUE DUN.

[Our experience, extending over 20 years, is that it is far better to err on the side of having too many varieties than too few. We have frequently found that after killing well with the *standards*, an unusually hot day has brought out swarms of some nondescript little insect, which the trout are feeding on voraciously, and unless amongst the stock in your book you can find something resembling it, you stand but a poor chance.—ED.]

SHETLAND AS AN ANGLING RESORT.—IV

THERE are many other lochs connected with the Brouster: how many we really don't know, for ever as you finish fishing one water another shows itself; but so far as our experience and that of our friends goes, there is no sport with sea-trout to be had in them, though, as there is no obstacle to their passage these fish are sure to enter them, and, perhaps, a worm-fisher might find them at home. Of these lochs the only ones whose names we have been able to learn are Flatpund and Spinner; for though we got a list of names from a friend some eight years ago, we have not been able to identify them. As, however, it may give the reader a better idea of the capabilities of this region we give this list as it was given to us, marking the lochs we can identify and mean to describe with an asterisk. Walls lochs—*Voe or *Bardister, *Song, Huxter, Melby, Norby, Collister, Boust, Danish Waters, Upper Burgo and Lower Burgo, Mill of Shenestwatt, *Flatpund, *Greenland, Brabister, &c. These are not, however, all situated on the Brouster only, as several lie close to the village of Walls and others, viz., Song, Huxter, Melby, Norby and Collister lie on the extreme west of the island. Of the two specially mentioned Flatpund Loch is not situated on the Brouster proper (which, by the bye, enters Vaxterbee not, as might be expected, at its upper end, but about the middle of the western side), but on a small tributary which joins the main stream a few yards above where it enters that loch. This loch lies close to the new road lately referred to, and is well stocked with good loch trout: it may be reached either by following up Foratwatt Burn or by following the new road which leaves the main highway at the foot of Voe Loch, the former course being as short, and better walking. We are thus particular, because we mean to give directions for the more northern chains of lochs by taking Flatpund as a central or starting point.

Spinner is a large deep-looking loch, and also contains good common trout. Many of the smaller lochs have no doubt never been fished within the memory of the present generation of trout, and should therefore, if sea-trout are not to be had, which may of course happen, afford ample sport even to the tyro; indeed we found that as good a way to fill a basket as any was to simply trail our flies along the surface with the rod held over our shoulder, the fish almost invariably hooking themselves; but this, of course is scarcely worthy of the name of angling.

We may conclude this paper by mentioning that there is at Walls a chain of lochs, viz., Voe or Bardister, Greenland and Brabister, which, of course, contain trout, some of them good ones, and at times sea-trout. Of the latter we have seldom taken many,

three being the most we ever took in one day; but we are told that in July, when, of course, there are few stranger-anglers about, there is sometimes a good run of finnock (not ginnocks as it was printed in our notice of the Wiesdale district), that is to say small sea-trout of about 10 inches to 16 inches long into them. There is also a brace of lochs connected with the sea by a small burn named Foratwatt, which winds round the back of the post-office, and in these there are very good loch trout. The burn itself though a mere ditch often contains small sea-trout after very heavy rains: we have caught them in it over 2 lb., so, if the weather be such as to make one unwilling to be far from shelter, a little sport may be had, so to speak, at one's own door.

Having thus exhausted the roll of lochs near Walls, we shall, before speaking of those farther afield, give a table of distances and directions.

Wiesdale Bridge to Toomlin Burn . . .	5 miles.
" " Bixeter or Twatt Burn . . .	6 "
" " Hulma Lees Loch . . .	7½ "
Walls village to " " " . . .	4½ "
" " Grassawater " . . .	4 "
" " Culyerin " . . .	5 "
" " Marly Loch (Vavels) . . .	5½ "
" " Clenswaters . . .	6 "
" " Clouster Loch . . .	7 "
" " Hyla Waters . . .	3 "
" " Murister . . .	3½ "
" " Bridge of Walls . . .	1½ "
" " Brouster Loch (upper end) . . .	2 "

These are reached by proceeding from Walls in an easterly direction along the main road; the following are to be got at by proceeding in a northerly direction up the burn of Foratwatt or the new road:—

Walls to Foratwatt Lochs about . . .	1 mile, N.
" " Flatpund " " " . . .	2 " " N.
Flatpund Loch to Vaxterbee Loch . . .	¾ " " E.N.E.
" " " Spinner " " " . . .	3 " " N.N.W.

Of course all these distances are only approximate, there being no milestones on the moor, nor, for the matter of that, on the roads either.

There is a professional guide at Walls, Halcro by name; and, though we have never ourselves employed him, we believe a stranger might do worse than entrust himself to his guidance at first, though attendants are usually an unmitigated nuisance to any one fond of his own way.

Before proceeding to discuss the angling capabilities of the waters more remote from Walls, it may be as well to mention what accommodation is to be had there. As this is the favourite resort for anglers on the Mainland, there is at times a "crush," and unless lodgings be secured beforehand the tourist angler may be literally left out in the cold, unless he takes the precaution of securing lodgings beforehand. If he does not do so, he runs the risk of having to "chum" with a stranger, who may, of course, prove very objectionable company. Accommodation can be had at (a) the post-office, with Mrs. Nicholson; (b) with Mrs. Watts, next door; (c) at Twatts, the grocer of the village; (d) at Mr. Smith's, Greenland; and also, we believe, at Georgeson's, the public-house. The writer has stayed at the first two, and can recommend them both. The usual charges are from four to five shillings a day, and this is about the usual price throughout Shetland. As it may interest some of our readers, we may mention that on one occasion a party, "quorum pars magna fuimus," camped out at the head of Brouster Loch, and, being much favoured with good weather at first, enjoyed it; but a sudden change of weather convinced all that during good fishing weather

Shetland is not a country suited for tent-life. This opinion was that of experienced campaigners, as several of our number had been often under canvas before. SCOTUS.

[We shall publish next week a map of the district so capitally described by "Scotus." The map has been prepared by him from actual observation, and it is the only map of the district in existence.—ED.]

OTTERS AND HOW TO CATCH THEM.

AS the game preserver, in order to secure safety and freedom from molestation for the various birds and animals which constitute his charge, seeks at all times for opportunities, and takes speedy advantage of such, to destroy the different kinds of vermin possessing such habits as bring them into disrepute as continuous and virulent destroyers of his game, often maintained at great cost, so must those who, taking a delight in a rural pursuit of somewhat contrary nature, to wit, the Waltonian craft—and which, it seems almost superfluous to remark, depends upon the extent of expense and trouble devoted to protecting and increasing the fish of multifarious kind which people the rivers, streams, and lakes, large and small, of these islands in particular and other lands in general—so must they, in similar manner, endeavour to eliminate from their aqueous preserves such enemies as their finny protégés may have to encounter and remove such dangers as may threaten them.

Apart from the many diseases which attack fish, we believe, of every kind, there is no worse destroyer of the finny tribe than the otter—an animal whose haunts are as uncertain as its appearance rare, and whose habits render it as obnoxious a pest to those bent on the improvement of their salmon and trout streams, as are such animals as the stoat and polecat to those whose tastes incline them towards game preserving and its attendant features. This, then, is our reason for laying before the readers of the FISHING GAZETTE such particulars concerning the haunts, habits, and nature of the otter, together with all information necessary to enable those who suffer from its depredations to successfully cope with this animal, and by means of capturing to cause a cessation of its maraudings in their fish preserves.

The otter is certainly becoming less frequent in our streams than it used to be, probably owing to the general viciousness of its nature, having brought it into repute so bad that its destruction—whether at the hands of dogs, with all the attendant incidents and excitements of an otter hunt, or unostentatiously at the hands of the fish-keeper—is now regarded as a matter for mutual congratulation by the proprietors of the streams which still afford it comparative safety and the seclusion which it so industriously courts. Were its habits better known and the haunts to which it chiefly clings better defined, it is certain that such otters that frequent streams to which the regular packs of hounds resort in pursuit of their eel-like quarry, would more speedily fall victims to the lures and wiles of such game, or other keepers whose field of supervision extends to the water edge of river; but, as it is, its retiring and most undoubtedly wary mode of existence is less liable to observation and subsequent molestation by such generally acute personages.

Forming as it were the link connecting the terrestrial with the aquatic animals, the otter bears some very curious features; for, although duck-footed and able to remain some considerable time beneath the surface of the water, still it does not by any means fulfil the conditions which might earn for it the attribute of amphibious; for, although able to continue submerged, it is obliged to return to the surface in order to breathe, it being without any means for sub-aqueous respiration, so that it is quite possible for the otter to be drowned. Advantage is sometimes taken of this fact, and nets are set with a view to causing the entanglement of any otters

seeking to pass, in their meshes, when, if the animal be not able to relieve itself with sufficient speed, it must inevitably die. It happens, however, more often than not, that rather by accident an ignominious death puts an end to the marauder's career, rather than by nets expressly made in order to accomplish its discomfiture. The size of the otter is not on an average large, but varies a good deal in individuals, some being as much larger than others as different in general form. The male is invariably the bigger of the two, and measures in length between extremes from 39 to 42 inches, which measurement may sometimes increase so as to attain so great a length as 48 inches, such specimens as these are, however, of but rare occurrence, and sufficient importance to be placed on record. The female, although but very rarely exceeding her male in size, is mostly smaller, measuring for the most part some two or three inches less, while her weight is consequently less; the average for the male being about 18 to 26 pounds, the female from 15 to 23. These figures vary of course a good deal, even in specimens from the same locality, while in different ones with more or less opposite characteristics, the variation in size is still more marked, and even such prodigies as otters weighing forty pounds are of well authenticated occurrence.

The fur of the otter when dry is of considerable beauty, being a dark rich brown, pervaded with a very slight tinge of grey throughout, most noticeable on the inner and under surfaces, where the colour is less striking. A light-coloured spot, of small dimensions, is situate at the back of each side of the lips, sometimes almost unobservable. It is in others almost white. The fur consists of two kinds—an inner one, thick, soft and velvety, lying close to the skin, provides the necessary amount of protection for the animal's body from water, which, except under extraordinary circumstances, fails to penetrate it. The second outer coating of fur is more bristly, longer, and evidently enables the animal to pass through the water with sufficient celerity, offering but little resistance compared to what the other would, as it is only too patent that the otter must be peculiarly favoured to attain the wonderful speed at which it unconcernedly travels. The various parts of its body, too, are equally remarkable. The head is broad and flat; the eyes, small but brilliant, and of considerable power, are placed more forward than is the case with most quadrupeds, protruding slightly, and so situated, moreover, that their owner can with ease distinguish objects above it as well as all round; thus possessing the animal with the peculiar ability of lying at the bottom of the river in wait for fish passing, these being unable to detect the presence of the animal they so much dread. Not only is this the case when the otter is stationary, but obviously it can with equal ease swim up beneath fish and, in any case, capture them with ease. Were this not the case with the animal we discuss, it would be a matter of plain impossibility for it to obtain an existence; for although its movements through the unstable element are made at an undoubtedly astounding rate still, after all, it is but a snail's pace compared to the greased lightning-like dartings of a "speckled beauty." The mouth of the otter is, comparatively speaking, a small one, but by no means less effective. The lips are exceedingly muscular, can be brought very tight together—the upper ones being furnished with long, bristling whiskers. The same exact suitability of the animal to the life it leads is apparent in its mouth, which could not be better adapted for the infliction of deep, tearing wounds, such as is necessary to securely grasp and hold large and powerful fish, as the salmon, with ease and certainty. Further description of the portions of its body are unnecessary; for in every limb, showing some peculiarity favouring the animal's mode of life, is apparent that wonderful litheness of form which the otter at all times so unmistakably displays. Its motions on land, although to some extent not exactly ungainly, or even awkward, are, as it

were, slow, and inspire one with an idea of the unfamiliarity of the animal with the movements necessary to locomotion on *terra firma*; but once in the water, in its favourite element, what a change is manifest! Gliding at one moment with consummate ease and contentment, it is the next moment in headlong course, bounding with inexplicable silence at a rate as prodigious as the movements which originate it are elegant. To our mind, the movements of an otter, unaware of any observer, are among the most elegant of those any animal can execute—turning, twisting, in one easy and delightful gambol, one almost longs to participate in its silent gyrations through the water, and regrets such elegant and apparently innocent enjoyment is but the prelude to wholesale massacre of the trout and salmon and other finny favourites we prize.

When pursuing the fish it seeks to capture, the otter's movements are far more stealthy than when it indulges in its matutinal gambols, and until within, we might say, striking distance, its following of its prey is rated according to circumstances until at length, all things being suitable, and the moment favourable, in one sharp dash it has secured its quarry; and, with complacent slowness, swims with its quivering prey to a spot suitable, whether a rock in mid-stream, adjacent to the bank, or on the bank itself, where it may with comfort regale itself to the best of its ability. What contributes considerably to the amount of havoc committed by the otter is the habit it has of capturing so many large fish. Instead of making a meal from one whose size would determine it as amply sufficient it merely consumes, in a general way, a portion of the back, and leaves the rest lying where it was conveyed, and then proceeds in further search. If the captured fish be of small size, so to speak, it may eat nearly the whole, leaving only such portions as are unpalatable to the dainty tastes of the animal, it being quite able to choose between what are undoubtedly the best portions of its capture. Thus we often find good-sized fish, almost intact, a small part only of the back, adjacent to the head, being devoured. But where food is not so easy of obtainment, and when bent rather on the satisfying of any pangs of hunger it may feel, the otter devours the larger portion of the fish, leaving, unless its cravings be very strong, the part below the vent. When observed in quest of its prey, the otter is invariably swimming against the stream, for what precise reason we are unable to say; but obviously for one having relation to the object in view, rendering the desired result more easy of realisation. The salmon falls, of course, victim to this animal's rapacity; but owing to its difficulty of capture, far less often than the trout, it being averred that in some cases two otters join issue, in the hunt, and by dint of strategy and the additional aid their union produces, capture many noble fish which would be quite able to elude the vigilance of a single one; and that by hemming in a salmon in a pool with shallow and narrow top and bottom, that it is possible for them to so tire the fish by incessant chasings until it at length succumbs to their strategy.

It has been asserted that the otter is undeserving of the disfavour it has acquired, and that, far from being injurious to fish-culture, it is, on the other hand, most conducive to the increase of either trout, salmon, or any other of the many and varied fish which it finds palatable to its taste. It seems almost ridiculous to contemplate the energy with which totally ignorant people will deny statements founded on fact, gained by personal experience on the part of naturalists and anglers; and even when proofs are as plain and plentiful as the proverbial pikestaff, still such obstinate-natured persons, not content with exhibiting their own ignorance, will cavil at the knowledge of others; condemn it as false and prejudiced, and totally unsupported. Be this as it may—and it no doubt is very fine in its way—we are not going to enter into any argument on the subject. We know what otters are

and what they do. There is an animal called the stoat, small in size but well known to game-preservers, which, no doubt, has been heard of by many readers of this journal. This animal will sometimes destroy in one day sufficient animals and birds to provide it with a substantial meal daily for a month. The otter does very much the same thing, never contenting itself with killing fish sufficient for its actual wants, but besides destroying in order to provide a meal three or four times more than it wants, it continues to catch and destroy enough to provide twenty meals more, not one day, but every day, without intermission. When its breakfast, or dinner, or whatever it may term its eating time, is over, the otter commences to amuse itself by catching and killing as many trout, or whatever fish it may be, in as wholesale a manner as possible, depositing a victim here, the jagged remains of another there; and so on till its bloodthirsty desires are satisfied, or till some alarming circumstance sends it at silent, headlong speed to the fastness of its domain. We have heard it advanced that the eel is a ruthless destroyer of salmon and trout ova. Whether this be the case or not, *vide* Mr. Keene. Further, that otters only eat eels, and that, as a matter of course, the result is an increase of trout, etc. Now, we have seen many rivers where trout and salmon abound, but we never saw otters in them; but we also are aware of many streams where the otter revels in its unmolested state. Curiously enough, there are little or no fish of the kind named in them; and, if we mistake not, eels are neither plentiful nor large, as a general rule, in streams where the trout and salmon spawn; and taking this into consideration, we fail to see the exact place where the otter's good deeds are most manifest by their good results. Anyhow, the otter is the vermin of the river, and no amount of argumentative palaverings will prove it otherwise. Probably, now that hunting the otter has become so popular, some of those who follow the foil will seek the increase of the animal they chase, and in doing so seek to curtail, and perhaps eventually extinguish, the angler's diversion. Some cross-grained people do not seem to participate in the pleasures of fishing, and, moreover, dislike the fisherman, even to the extent of seeking, whenever chance offers, to malign him and the craft he follows with so-much-to-be-admired perseverance.

Besides its human foes, the otter has other cause to fear when cold weather rules, and frost and snow forms an effectual barrier to its food. Then often it may die of hunger, but will, if such be within its reach, attack lambs, young pigs, poultry, and even rabbits, to obtain the food it so badly requires. On other occasions, its river haunts having become low through drought—or when the opposite occurs, and through heavy rainfall the otherwise placid stream develops almost into the torrent—it is unable to obtain the fish it requires, the otter has perforce to resort to animal food, such as above mentioned, sometimes even to that of a vegetable nature. Luckily, however, such disastrous circumstances but very seldom occur; and, although hard frost may inconvenience it to some extent, it is, on most occasions, able to weather any adverse times it may have to encounter.

ERICA.

(To be continued.)

ONE MILLION SOLD.

MESSRS. CHUBB AND SON, Lock and Safe Makers to the Queen and to the Bank of England, have just issued a new Illustrated Priced Catalogue. It is by far the largest and most complete in the trade and has been compiled by the firm. It consists of 28 pages; contains nearly 150 illustrations; the prices of 700 different articles; and no less than 1100 dimensions of Locks, Safes, &c. It is stated that nearly *One Million* of the Patent Detector Locks have been made and sold.

ILLEGAL FISHING IN THE LEA.

FREDERICK GROVES, of Rushmore Road, Upper Clapton and Henry Eaton, of High Hill Ferry, were charged on summonses with using a net for the purpose of taking fish in the river Lea, contrary to the Act.—Mr. George Corble, clerk to the Board of Conservators of the Lea River, prosecuted, and said that the proceedings were taken under their Act, which set out the size of net which might be used in the river, a small net being allowed for the taking of small fish for bait. The defendants, however, had been found with a net which would take the largest fish in the river, and they had captured, when found, over 13½ lb. of fish, their net being over forty yards in circumference.—Police-sergeant 4 N R, and a constable of the same division, then gave evidence, showing that on the 4th inst. the defendants and two other men were seen on the bank of the river working a net, and on the approach of the officers they ran off. Groves was, however, seen to hand the net to one of the men, and Eaton had a bag containing fish, which he handed to the other man.—Mr. Hannay fined the defendants 20s. and 2s. each, ordering the net to be destroyed, in accordance with the 14th section of the Act.

"THE CARMICHAEL PORTABLE BOOT TREE."

ANY one who has travelled much—and in these days of cheap excursions and tourists tickets, who has not?—must have often found the great need of a portable boot tree. For anglers especially, the difficulty of knowing what to do with their wet boots, minus the wooden trees, is at all times a problem, solved very often in many very amusing ways. It is, therefore, with much satisfaction that we call the attention of our readers to a simple yet admirable invention, called the "Carmichael Portable Boot Tree." Before describing it, we may at once say that the invention is not intended to *disestablish* the wooden trees, but, rather, to take their place on occasions and at times when it is impossible or difficult to carry wooden ones about.

The "Carmichael Portable Boot Tree" consists of an india-rubber bladder, which, being placed in the boot is blown out—inflated—to the required extent, and then completely occupies the entire space within. For wet boots this is invaluable, as it prevents them shrinking; and the great consideration is that it packs away into a very small space, being thus easily carried and ready for use at a moment's notice. This "Portable Boot Tree" is made in two ways—one of indiarubber alone, the other of indiarubber spread on a linen foundation. The first is very elastic and capable of great expansion, by inflation. The second can only be inflated to the size to which it is made.

The soldier, the tourist, the hunting man, and the angler especially, will have cause to welcome this invention, as supplying a long-felt want.

In conclusion, let us add that the "Carmichael Portable Boot Tree" can be seen at, and procured from, the sole makers, Messrs. W. Sparkes, Hall and Co., 308, Regent Street, London, W.

RIVERS CONSERVANCY.

MR. C. N. CRESSWELL is to read a paper on this subject before the Society of Arts on Wednesday next, the 23rd inst. The paper will deal principally with the three important topics of Floods Prevention, Rivers Pollution, and the Supply of Water.

TO ANGLERS.—W. J. Cummins, Fishing Tackle Maker, Bishop Auckland, is now prepared to forward to anglers his Illustrated Catalogue, which is not only a Trade List but is interspersed with practical hints, useful directions, and valuable information gathered by the river-side from twenty years' experience. The stock consists of his unrivalled Salmon, Trout, Grayling, and Pike Rods, Lines, Reels, Baskets, Artificial Baits, Fly-books, Landing Nets, Gaffs, and last, but not least, his celebrated TROUT FLIES, which for killing powers stand unequalled. Every article kept in stock is of the very best description.—[ADVT.]

TRENT FISHERY BOARD.

THE annual meeting of this board was held on Friday, the 21st ult., at the Midland Hotel, Derby, Earl Manvers in the chair. The annual report of the secretaries (Messrs. G. M. Hutton and T. Worthington) was read as follows:—In presenting to you our report for the past year, we have little that is novel to remark upon as regards the fishing season. Great floods have prevented the draftnet fishermen having their average amount of capture of salmon. The stand net men have, however, had a fair time of it, whilst the rod-and-line fishermen in the upper waters have had an unusually good year. The licenses issued for net and rod have been slightly in excess of previous years, giving a slight increase in revenue, but, on the other hand, the expenses of prevention for offences against the Salmon, Dynamite, and Freshwater Fisheries Acts, have been unusually heavy. Thirty persons have been prosecuted for various offences, and twenty-nine convicted, the thirtieth prosecution having failed on a technical point, that the river Mear, a tributary of the Trent, where the offence was committed, was not sufficiently proved to be a salmon river. The breeding salmon were on the spawning grounds earlier than usual in very large numbers, especially the male fish. The spawning was very quickly over, perhaps not more than a fortnight, and then the fish returned to deeper waters. This remark applies particularly to the Dove, but a greater number of fish than usual have passed Burton-on-Trent and gone up to the spawning grounds of the Blith and other tributaries of the Trent. Through the excessive freshes of water we believe salmon have ascended higher than we have ever known them to do. The question of pollution of rivers is still a very prominent one. We are glad, however, to be able to report that the sewage works at Nottingham are virtually completed, and the sewage taken five or six miles to a sewage farm of upwards of 600 acres. The high-level sewage of Nottingham is at work, and the low-level will shortly be. The whole work promises to be a success. We are informed that the corporation of Burton-on-Trent have obtained their Act of Parliament for dealing with their sewage, and will proceed with their works shortly; but we regret to say that nothing has yet been decided as to the disposal of the sewage at Derby. This sewage question is one mutually affecting the country generally in a sanitary point of view; for not only are fish poisoned in countless thousands, but the health of men and cattle is seriously affected by polluted streams. It is believed that if the Trent and its tributaries were relieved of the sewage now discharged into it, it would be one of the most prolific salmon rivers in England. We have not heard anything of salmon disease in the Trent, which has been prevalent in other rivers. In pursuance of the resolution passed at the last special meeting of the board, with respect to the issue of trout licenses, letters were sent to the various boards that have adopted the system, and we now produce the replies we have received, which show that the plans of different boards very considerably agree both as to the charge for license and the period of its use. We also wrote in pursuance of a similar resolution, to conservators who had for some time ceased to attend the board. Some we found were dead, some had left the neighbourhood, and others, including Mr. Nesfield, Sir Percival Haywood, and Mr. Minton Campbell, wished to resign. We also wrote to a number of gentlemen on the trout licence question. The replies have been almost unanimously in favour of it, there being only on dissentient, and two qualified answers. We have had submitted to us a copy of the Bill consolidating the Salmon, Dynamite, and Freshwater Fisheries Act, now before Parliament, brought in by Sir Joseph Bailey. The second reading is fixed for February 3rd. It will have our best attention. We cannot conclude our report without mentioning the lamented death of Mr. Frank Buckland, one of the Salmon Fishery Inspectors. His death is a great national loss, and the Trent Fishery Board have lost a true friend, ever ready to give his kind advice.—The report was adopted, and the election of new conservators was proceeded with, the following gentlemen being appointed:—Nottinghamshire—Earl Manvers, Messrs. G. Egerton, H. Eyre, Newton and F. Foljambe. Derbyshire—Messrs. J. Worthington, A. Holmes, J. Towle, A. Worthington, W. C. Curzon, W. Wood, and A. Bagot. Staffordshire—Messrs. A. Worthington, J. Worthington, W. Wood, A. Bagot, Captain Dawson, and the Rev. E. Daine. Leicestershire—Messrs. J. F. Fox, J. Worthington, W. C. Curzon and E. H. Pears. Lincolnshire—Mr. F. Anderson, Col. Hutton, and Mr. F. Foljambe. Mr. Holmes proposed that the Board adopt the provision given by the 7th section of the Freshwater Fisheries Act, 1878, with respect to the power to issue trout licenses, the charge for such licence not to exceed one shilling, and that the necessary notices be given in the usual way. Mr. Curzon seconded the proposal, which was unanimously adopted. In consequence of Mr. Worthington being obliged to discontinue doing the work of secretary to the board owing to illness, it was resolved to request Mr. Eddowes, secretary to the Derbyshire club, to become clerk to the board.—*Newark Herald*.

ANGLERS should always be provided with something to take away the swelling and poisonous effect of the bites of insects. They should also have with them something to apply to a cut or sprain. Pond's Extract reduces the swelling and inflammation, stops bleeding and pain, and hastens the healing process in case of any wound or sprain; and it has no equal for application to the bites and stings of insects. Therefore never go on a fishing excursion unprovided with a bottle of Pond's Extract. It is for sale at all chemists, at 2s. 3d., 4s. 6d., and 8s. 6d. per bottle.—[ADVERTISEMENT.]

GEORGE JAMES EATON, of Starkholmes Matlock-Bath, Derbyshire, respectfully invites Noblemen and Gentlemen to try his standard FLIES for the present season. No flies sent or made up but what he himself has proved sure killers. A trial is all that is required from gentlemen who can fish to prove whether they may be genuine or not. Patronised by some of the best fishermen of the day. All flies dressed on the best Kendal hooks. Prices: Point Flies, 2s. 6d. per Dozen; Dropper Flies, 2s. per Dozen. Orders punctually attended to.—[ADVT.]

RIVER REPORTS

MID-THAMES.

"Tell me, where is fancy bred,
Or in the heart, or in the head?"

I imagine the best place to find fancy bread, would be in a baker's shop, but where to find fish just now, except at a fishmonger's, is more than I am able to inform the angling public. The Thames is still out of its bed, and "o'er the hills and far away";—which is certainly not one of the least ills that angling flesh is heir to. Fishing, except on the grass, and in snug eddies and lay-byes, is almost impracticable. In my own sleepy hollow of a "deserted village" the water has already inundated the ground floors of the cottages—men are being taken to and from their homes in punts, and if we have but some few days' more rain, I intend to ask a few choice spirits down to enjoy a little quiet fishing from the bedroom windows. Would you join us, Mr. Editor? At the late meeting of the Reading Angling Association a rule was adopted that a reward of £1 be paid to any person killing an otter between Goring and Shiplake on the Thames, or on the Loddon or Kennet, within ten miles of the main stream. On the morning following the passing of this resolution, Mr. May, of Sandford Mill, caught a female otter, which scaled 13 lb., and, after showing the same to the officers of the association, received the first reward. Many others have been seen between Caversham and Pangbourne by the bailiffs and others; so, now twenty shillings is placed upon the arrant poachers' heads, a *caput-al* deliverance will doubtless take place on behalf of the before-mentioned lady sovereign. Thursday evening.—River out of all fishing trim—highly flooded, and still rising.—MARLOW BUZZ.

Exe (Exeter).

Since my last, little can be said as to angling prospects. The rivers have been running exceedingly high, viz., the Culm, the Creedy and the Barle; consequently, the Exe has been excessively high, more so than it has been for years. The gales of the past week, with the heavy rains, snow and severe hailstorms, have been enough to keep the stream considerably above the usual level, without the addition of the above rivers. Upon several occasions it has risen over 14 and 16 inches in one hour, threatening many of the low-lying places with inundation. Fishing, of course, is quite out of the question, and likely to be. We have now reached the thirtieth hour of rain, with every appearance of thirty more. I have not heard of a single fish having been taken—but fish there are and plenty. Salmon are seen hourly, passing both up and down. The kelts and slats will not stop long with us this season; if these freshets continue, they will have no trouble in getting back to sea. Trout have been espied in goodly numbers and large in the pools close to the city. I was afraid we should have had to report many dead and injured fish going back, but have not seen any at present. The herrings are all gone from the estuary, and the fishermen have taken to their old work again, but during the past week have done nothing. Fish of all kinds in the market very scarce; the supply being chiefly got from Grimsby. I have just heard they are flooded at Tiverton, and it is blowing a gale, with heavy rain—so we know what to expect for the next day or so: no fishing, for certain.—FRANK GOSDEN.

Barle and Exe (Somerset).

Owing to the recent heavy rains, these rivers have been in a state of flood during the greater part of last week, but they are now fining down. A good deal of snow-water is coming from the hills, which, of course, is not favourable for fishing. Nevertheless, if we do not get much more rain, they will be in fair order in a few days. The weather at present seems very unsettled. During Thursday last a very heavy flood came down, and, of course, every boy that could get a stick, a hook and a worm went out fishing, and a great quantity of fish were caught, I am sorry to say, as the trout are not in very good condition, although much better than I expected to have seen them after such a severe winter. Since the opening day very little has been done with the fly, the largest basket taken being sixteen.—W.

Thames (Windsor).

Water still very high and thick; banks are submerged, and angling can only be carried on under great difficulties. Very few have attempted it lately in this neighbourhood, but at Bray I heard a gentleman last Sunday had a nice little bag taken on the grass ledgering with redworm, consisting of 13 fine roach, 9 perch, and a brace of tench going nearly 6 lb. At present there is very little chance of knowing the whereabouts of "the spotted beauties," but a week or two of fine weather with warm sunshine, I shall be able to record their locality and probable weight. Bank anglers must be getting impatient, as we have now barely a month left, and they will be fortunate if they get a week out of it. Noticing several attempts to get at them last Sunday, London anglers can save themselves trouble and expense if they like to write me a line and enclose post card; they would then know state of water, and I should be pleased to give the information, as I can imagine their feelings on arrival here.—B. R. BAMBRIDGE.

Colne (Thorney Broad).

The water is now in first-rate condition for angling. There is every prospect of good sport if weather continues fine. Messrs. W. and T. Hawkins, Young,

and Bayford have been out, and, although it was a flood, they succeeded in taking some roach and perch and a few jack. Mr. W. Hawkins out on Thursday afternoon, got a few roach. Anglers are reminded that subscriptions to these waters for the ensuing season are due in March next.—E. GODFREY.

Dove (Derbyshire).

This river has been swollen like a sea since my last notes appeared, and it is little better at the time of writing. What is to become of all the anglers if this state of things continues much longer it is quite beyond my limited means to prognosticate. Just when the season is closing, too! In another three weeks we shall have to lay aside the grayling and coarse fishing rods generally for three months. Jupiter Pluvius might, considering this circumstance, have been kind enough to limit his aqueous supplies, but he is at the best an unconcernable kind of person, and devotes as little consideration to the requirements of anglers as to people in general. Immense damage has been done in the valley of the Dove by the tremendous volume of superfluous liquid. Trees have been uprooted in all directions, and several bridges no longer remain where the builders deposited them. Fishing operations during the week have been dead as the Dodo, and beyond saying what I have as to the abundance of unnecessary water, I am like the needy knife-grinder—without a story to tell.—THE SPODGER.

Lee (Co. Cork).

Angling on the Lee opened on Tuesday under most favourable circumstances of weather and water. Very few spring salmon were landed; numerous slats or old fish took the fry, but all round there was great scarcity of springers. Speaking of the results of two days' fishing, prospects are anything but encouraging. The successful anglers were Sir Augustus Warner, 1; Lieutenant Young, 1; Ned Murphy, 2; Jerry Healy, 1 of 19 lb.; a gentleman fishing on Mr. Barters, 2. The river continues in good order to-day (Thursday), there was drizzling rain, but nothing sufficient to colour the water or interfere with angling.

Medway (Tunbridge).

The water is fining down and with a continuance of fine weather will be, by to-day (Saturday), in splendid condition for angling. During the week there have been some good catches of jack, roach, and chub, one of the latter scaling 2½ lb.—MEDWAY WATER RAT.

Ouse and Ivel (Blunham).

These rivers, after the long flood, will be in fine condition by Saturday, the 19th. A fine show of roach have been taken on Thursday by a Mr. Paddock.—T. ELLIOTT.

Suir and its Tributaries (Clonmel, Ireland).

The floods still continue; we have had no salmon fishing for the past week; the cots got a few by venturing out in the flood, but it was only because there was such an enormous run of spring fish that they got any, as the river was entirely too flooded for the usual ordinary fishing. The trout-fishing has wonderfully improved; the fish are in better condition than they have been for many years at this season, especially on the Lenawn, when Major Toppin got 18, yesterday; the Taw, where Master Fennell also got 18, yesterday; at Glenlu and other small streams, where from two to three dozen were got by occasional anglers; Mr. Helen got 38 on the Cladiagh; Mr. Wilkinson had a good basket at the Glasha, both with worm. The favourite flies are rat's-fur, and red hackle, silver and black hackle, and silver grouse and spider wrens.—DORA.

Trent (Newark).

The very heavy flood of last week began to slowly recede on Sunday and Monday, but unfortunately it rained very heavily the whole of Monday, which caused the river to again rise on Tuesday and Wednesday. To-day, Thursday, it is slowly going down; but as yet it is over the banks, and a lot of land is submerged, so that it will take a few days yet before it will be in anything like condition for worm-fishing; if the weather holds the same as it has been to-day, a start may be anticipated by the end of next week. The close time is drawing near, so that I hope the present weather may continue so that rosters may have a week or two in which to make up for previous disappointments. The cockspur worm will be found the best bait for the first few days when the water gets anything like.—THE TRENT OTTER.

Trent (Nottingham).

The great flood we had on the Trent at the end of last week had only subsided about a couple of feet before rain again set in, and on Monday it continued to rain incessantly for ten hours without once ceasing, when, of course, the fishermen in this locality at once came to the conclusion that a greater flood than the last was sure to be the result; this, however, luckily did not happen, though the rain prevented the water from going down, as it would otherwise have done had the rain kept off. I am, however, pleased to state that we got on Tuesday a favourable change for the better, both in water and weather, which caused the angler to be on the look-out for a chance of doing a bit more fishing, and certainly, as the close season is so near at hand, they must not allow anything like a favourable chance to pass by. They should remember that the month of February is perhaps the best in all the year for roach-fishing with either paste or worms, but on the Trent the latter is generally found to be the most killing bait; the cockspur worm is doubtless the best for bottom fishing on our river, it takes all the fish that are in the habit of feeding during the winter months, such as roach, dace, perch, chub, and bream; and, although the water has been at a great height, several bream were taken out of the flood with the bait just mentioned, besides a few roach, but as soon as the water began to subside the fish went with it. The river to-day (Thursday) is going down rapidly, and the weather also is fine and warm, so that we may expect some fishing will be done by the time this letter is in print. During the flood a great number of salmon have come up the Trent, and have been seen jumping at the different weirs.—W. BAILEY.

Wye and Derwent (Derbyshire).

A great deal of both snow and rain has fallen in Derbyshire since my last report, which has caused both rivers to have floods on them again, which brought the bleach-net party out with their nets. I hear they took a fair quantity of fish between Darley Bridge and Matlock Bath, viz.: trout, grayling, and a few coarse fish. The large flood of last week left a good many fish out in the fields and in the dykes, which have since been captured, since the flood has gone down, several trout and grayling being about a pound apiece. There has been a few bottom fishers out on various parts of the Derwent trying their skill with the little red worms (both cockspurs and brandlings), both yesterday and to-day (Thursday). They have succeeded in taking a few brace

each day, three and a half brace being the most any one caught. The weather seems more settled now, so no doubt I shall soon have to report some good captures off both the above rivers. The Wye will not be in order for fly-fishing before another week or ten days. The Derwent will take even longer than that to run down to its proper height for successful fly-fishing. There is nothing for the angler next week only bottom and pike fishing on the Derwent.—G. J. EATON.

Yare (Norwich).

The water is still extremely high, although it has not so much of that pea-soup appearance about it. Messrs. Capon and Corbyn (two gentlemen of the East Anglian Piscatorial Society) were at Thorpe the early part of this week, and were fortunate enough to take between two and three stone of roach, some of them weighing $\frac{3}{4}$ lb. and upwards. A man named Brown took two pike this week at Earham, 6 lb. each; also a bream weighing $9\frac{1}{2}$ lb., a tench 3 lb., and some extraordinary roach of $1\frac{1}{2}$ lb. each. No doubt if some of our friends visited these small streams more frequently, they would st and a chance of getting some good fish, which must have lain undisturbed for years.—**ANGLER.**

Yore (Yorkshire).

Still the same dismal story to tell of heavy falls of snow and rain on alternate days followed up by excessive floods, and immense damage done to the low-lying lands. It is an old Yorkshire saying that "February fills dyke," but I rather fancy it has proved more than usually correct this year. I am living in hopes that every day will bring better weather, but I fear that it will now come too late to be of any service for grayling fishing. All anglers who have not already possessed themselves of one of our worthy editor's copies of Mr. Rolfe's picture of "Salmon, Trout and Perch," should certainly lose no time in doing so; it is a really beautiful work, and will prove an ornament in any club room or any angler's "sanctum." My copy arrived on Feb. 14th, and a very welcome "valentine" it proved; I only hope that the sale of them will be great enough to induce Mr. Marston to issue further specimens of piscatorial illustrations, but this one should be considered more than usually valuable, as it is not every angler who has a purse long enough to afford an original picture from the brush of that master of the art, Mr. H. L. Rolfe; but this is an actual fac-simile, even down to his signature.—**FRANCIS M. WALBRAN.**

TO ALL WHO HAVE COLLECTIONS OF STUFFED FISH.

WE beg to call the special attention of clubs and private individuals to the prizes (see below) which will be awarded at the Norwich National Fisheries Exhibition for exhibits of stuffed fish.

Our Norwich friends are most anxious to see a good show of cases from the London clubs, and make the following most liberal offers:—

- (1) Chance of one of the valuable money prizes named below, as well as Government award.
- (2) Carriage of the cases (in a special van provided in London) to Norwich and back, *free*.
- (3) Care and insurance of the cases *free* during transit and time of exhibition.

As this forthcoming exhibition is the first of the kind which has ever been in any way supported or recognised by Government, we most sincerely trust that every angler will do all in his power to make it a grand success, and we feel certain that when it is seen what a vast field of industry is represented by the fishing interests, Government support will be more liberally accorded in future. Any one requiring information should write to the Hon. Sec., W. Oldham Chambers, Esq., Lowestoft.

NEW PRIZES AT THE NATIONAL FISHERIES EXHIBITION.

	Amount.	Donor.
49.—Collection of stuffed freshwater fish taken within the United Kingdom, to be competed for by angling clubs	£ 15	The National Fisheries Exhibition.
50.—Collection of stuffed freshwater fish, taken within the United Kingdom, to be competed for by private individuals	£ 15	
51.—Single specimen of stuffed freshwater fish, caught in the United Kingdom by the exhibitor	£ 5	Private prize.
52.—Method of preserving fish other than stuffing, with special reference as to colour	£ 10	The National Fisheries Exhibition.
53.—Dress for fishermen, including boots	£ 10	
		I O. H. Taylor, Esq.

In addition to the special Government medals, gold, silver, and bronze medals and diplomas of honour will be awarded in respect of the exhibits considered most meritorious by the Jurors in Classes 1 to 5, and diplomas of honour only in Class VI, of loan collections of the general classification.

ANGLING CLUB PRIZES.

THE FRIENDLY ANGLERS.

THE successful competitors of last year in the various angling clubs in London are now undergoing the pleasure of becoming possessed of their prizes at the numerous piscatorial banquets, or at some special meeting for that purpose, in different parts of our great metropolis. I had the honour of attending the annual gathering of the Friendly Anglers a little time since, when I was much impressed with the list of prizes that were offered by the members, and with three trifling exceptions not touching the funds of the society. I do not know whether there is another club in London that does the same thing, but as regards the Friendly Anglers, it is substantial evidence of the respectable position of its members; and what is more, the prizes are valuable ones, and the total amount is far in advance of many older societies. The sum last year that was competed for in various prizes amounted to £ 116 16s., of which £ 98 19s. was won. There is a capital fixture on the top of the prize list. "All prizes to be paid in before 30th of November, 1880, won or not," and I have not the least doubt all was duly paid into the hands of Mr. Pain, a very excellent treasurer, through the good offices of the energetic secretary, Mr. C. M. Le Good. There is also another capital rule "To take only three prizes;" and as a proof of the value of some of the prizes, Mr. Emanuel, the great trout angler, receives the handsome sum of £ 16 18s. for the three prizes which he has won. There are in the whole fifty-six prizes. In the first place there are no fewer than eight prizes for trout of the total value of £ 37 18s., all with the sportsmanlike condition of being taken either with the fly or on spinning tackle. There are two prizes of one guinea each for grayling taken in fly fishing. There are four prizes for jack, amounting to £ 8 18s. 6d. for largest specimens and gross weights. There are four prizes for perch, of the total value of £ 5 15s. 6d.—one for the largest specimen, and three for gross weights. There are no less than nine prizes for roach, of the total value of £ 13 5s. 6d.—one of £ 2 12s. 6d. for the greatest number of 1 lb. and over; one of £ 2 5s. for twelve of the largest, and one of £ 2 2s. for the largest caught anywhere; and another, which is the best, of three guineas for the largest taken from the Thames. There are four prizes for dace amounting to £ 5 5s. three being for large fish and one for gross weight. There are three prizes for chub, of the total value of £ 5 15s. 6d., of which £ 2 12s. 6d. is given for the largest anywhere; one guinea with the fly, and two guineas for gross weight. There is only one prize, of the value of one guinea, for the largest carp. There are two half-guinea prizes for tench—one for the largest specimen and one for gross weight. There are two prizes for bream—one of £ 1 11s. 6d. for the largest, and one of half-a-guinea for gross weight. There is a prize of half-a-guinea for a gross weight of gudgeon. There are four prizes for barbel, amounting to £ 11 0s. 6d.—one of £ 3 13s. 6d. for the largest, one of £ 1 11s. 6d. for the second largest, one of £ 2 12s. 6d. for Nottingham fishing, for fish of 3 lb. or over—the largest to win—and one of three guineas, for gross weight. The sum of £ 8 8s. is contributed towards prizes for a summer outing. There are two prizes for the gross weight of the year, the first receiving £ 2 12s. 6d., and the second one guinea. Two guineas is given for specified days. There is a consolation prize of one guinea for "most shows not taking a prize." There is a prize of half-a-guinea for a gross weight of sea fish. There are what is termed three general prizes—one of two guineas for most specimens with a fly; two guineas for gross weight, on Fridays and Sundays only; and there are three prizes of "best specimens, to be decided by committee," each prize being of the value of half-a-guinea. Out of the total number of prizes, 33 are for the largest fish, 18 for gross weights, and 15

miscellaneous ones. Altogether the list is a most satisfactory one, of which the club need justly be proud, and is worthy of example and imitation by other societies. In the report of the dinner, which appeared in a previous number of the FISHING GAZETTE, the names of the principal prizeholders and the amounts were given. I hope shortly to make another visit to the club-room to look over the Fish Museum, which, from the general appearance it presented on the evening of the banquet, was also of a satisfactory character. There is, as well, another satisfactory item—that for many years the Friendly Anglers have contributed two guineas to the funds of the Thames Angling Preservation Society. It was stated with regret by the President, at the dinner, that the Thames fishing last year was unsatisfactory, but I have found out on inquiry since then that one, at least, of its principal Thames members has fished the upper portion last year, instead of the lower district, as formerly. I hope this year the result in both portions will be better.

THE PISCATORIAL SOCIETY.

It is a very good arrangement in a large society like this, where its annual dinners are of a more public character, to make a special evening for the distribution of the prizes when the patriotic father of the society (Mr. F. G. Pearce) is afforded an opportunity of addressing his children, congratulating those who have been successful, and giving words of encouragement to those who have been less fortunate. The gathering on Monday evening last in the clubroom, Ashley's Hotel, Henrietta Street, Covent Garden, was made additionally attractive by this annual celebration, and the successful competitors in receiving their prizes were warmly congratulated by all who were present on the occasion. The amount of prizes offered by the society last year was £71 14s., the sum of £14 being voted as club prizes for specimen fish, and £57 14s. as private prizes. Out of this amount, £62 13s. has been won, viz.: £6 in club prizes and £56 13s. in private prizes. The following are the successful competitors:—Mr. Foreman taking no fewer than six prizes, amounting to £15 4s. 6d., including a silver cup, value £5 5s., given by Mr. T. R. Sachs, the first prize in the Shentonian competition, and the second prize in the barbel competition. Mr. Hunt takes three private prizes, amounting to £6 6s., including the first prize in the roach competition, and the second prize in the Shentonian competition. Mr. Thomas Huggett secures one club prize and three private prizes, amounting to £6 5s., including the club prize for the largest pike, the second prize in the perch competition, and two other private prizes for the largest trout and pike from the Thames shown on Monday evening. Mr. Robert Barker lands two prizes, amounting to £5 15s. 6d., being the first prize in the chub competition, and a prize for the largest chub. Mr. Frost obtains the first prize of £4 4s. in the barbel competition. Mr. Winton gets the second prize of £3 13s. 6d. in the chub competition. Mr. C. P. Wheatstone carries off the first prize of £3 3s. in the perch competition. Mr. J. F. Lovelock obtains the second prize of £3 3s. in the roach competition. Mr. Beasley, a private prize of £2 2s., given by Mr. F. G. Pearce for the greatest weight of roach and dace from the Thames. Mr. James Pattison, two private prizes of £1 each. Mr. M. H. Blamey wins the club prize for chub, value £1, and a private prize of £1 1s. for the heaviest chub from the Thames. Mr. Faulkner entitles himself to the club prize of £1 for the heaviest roach—a handsome fish of 2 lb. 10 oz.—and a private prize of £1 1s. for the heaviest roach. Mr. W. B. Adlington gains a private prize of £1 11s. 6d. for the greatest weight of chub from the Thames. Mr. Robinson has two private prizes, amounting to £1 10s. 6d. Mr. Marsden, the club prize of £1 for the largest tench. Dr. Thomas, the club prize of £1 for the largest perch. Mr. Walker, the club prize of £1 for the largest

dace; and Mr. Arter, the sum of 10s. 6d. for the second largest pike from the Thames, shown on Monday evening. The heaviest fish weighed in during the year have been as follows:—Salmon, 19 lb.; Thames trout, 8 lb. 3 oz.; common trout, 4 lb. 5 oz.; pike, 21 lb.; perch, 2 lb. 10 oz.; barbel, 4 lb. 10 oz.; roach, 2 lb. 10 oz.; chub, 5 lb. 8 oz.; dace, 10 oz.; bream, 3 lb. 4 oz.; carp, 9 lb.; and tench, 3 lb. 10 oz. I have only to add in reference to this very excellent society that it is also a liberal supporter of Thames Preservation, by an annual subscription of £3 3s. to the Thames Angling Preservation Society, and a number of its members are on the committee of that society, who are also individual contributors to it. B.

READING AND DISTRICT ANGLING ASSOCIATION.

THE annual general meeting of the members of this association was held at the Queen's Hotel, Reading, on Monday evening, and was attended by Mr. Charles P. Wheatstone (President of the "Stanley Anglers"), who was voted to the chair; Col. Heathcote, and Messrs. J. T. Brown, H. Creed, F. Hurley, Arthur Berry, L. Goodhind, A. H. Ayres, Jas. Bedding (Pangbourne), and Arthur C. Buffer (Hon. Secretary). Letters expressing regret at inability to attend were received from Mr. Richard Attenborough, Mr. J. H. Brooks (Henley), and several other gentlemen. Mr. Brooks wrote that the association was "not sufficiently appreciated by the public in very many ways," and that its object ought to be "better understood by both rich and poor."

Mr. Charles Stephens having been re-elected hon. treasurer, Mr. W. Ferguson was re-appointed auditor, and Mr. Henry Creed was chosen to succeed Mr. J. Simonds as his colleague.

The Committee were re-elected, with the exception of Mr. Chapman (deceased), the Rev. J. E. Vaux (resigned), and Mr. James Simonds (the new President); and Mr. Butler was asked to continue to act as Secretary.

On the proposed alterations of rules—as set out in the appended report,—some discussion took place. The suggestions of the committee were adopted, with the following amendments:—In Rule II., "one black ball in three," instead of "two black balls," to exclude; in Rule VI., to alter the days of meeting to "every Saturday," instead of "the first and third Friday in every month," and to add to the proposed addition to Rule VIII., "or on the Loddon or Kennet within ten miles of the Thames."

The following report from the committee, and the balance sheet for 1880, were read by the hon. secretary and unanimously approved—as amended—on the motion of Mr. Creed, seconded by Mr. Berry:—

REPORT—1881.

Your committee, in presenting their fourth report, are happy to be able to record a year of prosperity, the objects of the association having been well carried out, and the income fairly satisfactory.

The Trout Nursery at Caversham has been very greatly improved during the year, by the construction of an additional dam and the raising above flood and covering in of a considerable section of the stream, at a total cost of £26. The Nursery has been kept in good working order by George Knight, who is specially employed to clean and superintend it. Owing to the expenditure at Caversham, and the difficulty in getting fish, very little has been spent on trout this year; but as no more capital outlay will be required at the Nursery, it is hoped that a great number of large trout may be bought and placed in the river during 1881. Your committee have just purchased 80 or 90 stock trout of the famous Wycombe breed, a variety which has been found to succeed so well by the Marlow and Maidenhead Associations. The stock of young trout in the Nursery has been increased by 3000 *Fario* fry purchased from Uxbridge, 100 yearling Wycombe trout, and 6000 bull trout fry kindly presented by the late Mr. Frank Buckland. Altogether the association has placed in the river or in its rearing stews, about 59,000 young *salmonide*; and as a result a marked improvement was visible in the trout-fishing last season, and an extraordinary number of trout under 2 lb. were returned to the river.

Negotiations are in progress for the purchase of a large quantity of stock tench.

Some ditches in the district (permission having been obtained) have been dragged during flood time, and by permission of the Urban Sanitary Authority the fish were transferred to the river from the Public Bathing Place during the annual cleaning of that place. Over 400 chub (half of which exceeded 1 lb. in weight), 24 jack up to 2 lb. 40 or 50 perch up to ½ lb., 70 or 80 roach, about 70 large dace, and many thousand small fish—including a few trout—have thus been restored to the river during the year, at a trifling cost.

Angling has been much interfered with by the unusual number of floods; but sport must, on the whole, be considered satisfactory; and while there seems to be a marked decline in the stock of pike in the river—due, no doubt, to trailing and live-gorge fishing—every other kind of fish appears to be rapidly increasing. The event of the season was the capture at Reading in April last of a trout weighing 16 lb. 15 oz. This magnificent fish was purchased by Messrs. Ferguson and Sons, of Reading, and by them presented (through the committee of this association) to Her Majesty the Queen, who was graciously pleased to send the sum of £3 to Wicks, by whom the "monster"

was caught. The committee have presented a vote of thanks to Messrs. Ferguson for their promptitude in securing the fish, and their kindness in presenting it to the association. The late Mr. Buckland kindly made a very successful plaster cast of this noble trout; it is now being coloured and cased by Mr. E. W. Searle, and will shortly be on view in Reading.

Prosecutions.—Fortunately only two offences calling for prosecution are believed to have been committed in the district during the year. In the first, a person was fined 2s. and 8s. costs (or seven days' imprisonment) by the Henley County Magistrates for a breach of the Freshwater Fisheries Act, 1878 (sec. 11), by taking two jack during the fence months; and in the second case the conviction was for breach of the same section of "Mundella's Act," by selling a fish out of season, and was heard by the Reading Borough Magistrates, who fined the offender 2s. 6d., and 8s. costs (or seven days' imprisonment). In each case Mr. Henry Creed, who prosecuted on behalf of the association, requested the bench to inflict only a nominal penalty—these being the first prosecutions under the Act—and the offenders were warned that on any future conviction a heavy sentence would be imposed.

Competitions.—Your committee recommend that the competitions for "specimen fish" (Rule IX.) be continued.

Some alterations have taken place in the list of bailiffs. Robert Mills having resigned, William Moss, of Caversham, has been appointed in his place; and George Knight has been added to the staff. The bailiffs, and the lock-keepers and ferry-men in the district (numbering twenty in all), were entertained in January last to the annual dinner, at a cost of £5 to the funds; the gathering was a great success, and afforded much gratification to the men.

The cash account for the year ended December 31, 1880, shows that the income (including a balance from last account of £25 7s. 6d., has been £117 10s., and the expenditure £72 18s. 2d., leaving a balance at the bankers of £44 11s. 4d. While the income is less than that of last year by £80 10s. 9d., the balance is larger owing to a reduced expenditure.

It is with the deepest regret that your committee record the decease of Mr. Frank Buckland (Her Majesty's Chief Inspector of Fisheries, and one of the Vice-Presidents of this Association), whose death is truly a world-wide loss. Mr. Buckland took a deep interest in the welfare of the Reading Association from its termination, and assisted it by frequent most valuable advice and by liberal donations of trout fry. Mr. Stephen Chapman—a zealous and most valuable member of the committee, has also died during the year; and his untimely death is much deplored by those with whom he acted for three years in promoting the welfare of the association. It is proposed that Mr. H. Ayres be appointed a member of the committee, to fill the vacancy thus created.

Your committee beg to suggest the following alterations in the rules of the association, as set out in the notice convening this meeting:

(a) To add to Rule II.—"Gentlemen wishing to join the association to be proposed by a member of the committee at one of the ordinary committee meetings, and to be balloted for—two black balls to exclude."

(b) To alter the days of meetings (Rule VI.) to the first and third Friday in every month at 8 p.m., which have been fixed by the committee for their ordinary meetings.

(c) To add to Rule VIII.—"That a reward of £1 be paid to any person who shall kill an otter, provided that the otter be produced to the hon. secretary, and proof given that it was killed within the district protected by the association."

Since the formation of the association the meetings have been held at the Queen's Hotel; but the committee propose that for the future the headquarters be at the Great Western Hotel, where a club-room will be at the service of the members of the association every meeting night; and hope that by having regular meetings of the members in a room of their own the interest taken in the association will be increased. The best thanks of the association are due to Mrs. Cocks, proprietress of the Queen's, for kindly providing a room for its meetings since its formation.

The committee announce with great regret the resignation (owing to private reasons) of the president, Mr. H. J. Simonds, and thank him for his valuable assistance to the association from its commencement.

On the proposition of the Chairman, seconded by Mr. Ayres, a cordial vote of thanks was passed to Mr. H. J. Simonds for the great assistance he had rendered to the association from its commencement, accompanied with the expression of sincere regret that he was no longer able to continue his valued services as President, and the hon. sec. was directed to enter the resolution on the minutes, and forward a copy to Mr. Simonds.

It was heartily agreed, on the proposition of Mr. Hurley, seconded by Col. Heathcote, that Mr. James Simonds should be requested to accept the office of President, and that gentleman has consented to serve.

Col. Heathcote proposed that a vote of thanks be given to the Hon. Sec. for his exertions in behalf of the association, and that he be requested to accept an honorarium of £15 as a slight recognition of the value of his services during the past two seasons.

The motion was seconded by Mr. Goodhind, and unanimously agreed to; and Mr. Butler acknowledged the compliment.

The Hon. Sec. was directed—on the motion of the Chairman, seconded by Col. Heathcote—to convey to Mrs. Frank Buckland the sincere condolences of the association in her sad bereavement.

The business concluded with a hearty vote of thanks to Mr. Wheatstone for his kindness in taking the chair, and his efficient conduct of the business of the evening.

WEST CENTRAL ASSOCIATION OF LONDON AND PROVINCIAL ANGLING SOCIETIES.

A SPECIAL meeting of the West Central Association took place at the Portman Arms, Great Quebec Street, on Friday last. The minutes of the last meeting having been read and passed, the secretary, Mr. Hoole, read a letter received from the Thames Angling Preservation Society, appealing to anglers for assistance in their present rather needy condition, arising from the extra expenses incurred in the enforcement of new bye-laws against snatching and night lines, also some very important convictions.

Mr. Brougham, of the T.A.P.S. said that since he had last attended a meeting of the W.C.A. a vast amount of good work had been done by the committee of the T.A.P.S. He was pleased to tell them that the views of the W.C.A. with regard to the sizes of fish to be taken, and been unanimously adopted by the T.A.P.S. in a memorial which they had prepared to be presented to the board of Thames Conservancy, in which some other very important alterations in the existing bye-laws had been proposed; he had obtained the signatures to be appended to this memorial, *en masse*, and had also had many interviews with the secretary of the Conservancy Board, and now he felt quite sanguine of success. During the month of March last, he had seen with profound regret the practice of snatching going on at Teddington, and felt that something should be done this season to prevent such occurrences. A portion of the weir might with advantage be left open to allow the fish to pass up. One advantage had been gained, the keepers having received strict injunctions from the Conservancy to stop all snatching. In alluding to the private rights on the Thames, he observed that the lower Thames was not subjected to these inconveniences, but the T.A.P.S. had this subject under their consideration. He had received a communication from the Clerk of the Common Council, in consequence of which a deputation will be formed, who will proceed to the Board of Common Council to state their views of the matter, when they will be ably supported by several influential and well-informed anglers.

Mr. Murphy proposed that the usual donation of twenty guineas be sent to the T.A.P.S.

Seconded by Mr. Adean.

Mr. Noble moved as an amendment that the matter be postponed until next meeting.

Seconded by Mr. Fowler.

The proposition was carried unanimously.

Mr. Brougham then briefly thanked them for their unanimous vote of funds for the aid of the T.A.P.S.

The election of three visiting officers then took place. Mr. Osman, No. 1; Mr. Thorley, No. 2; and Mr. Wilson, No. 3 districts.

Mr. Murphy proposed that the canal question should be postponed until next meeting night, and that that night should be considered as a special meeting night.

Seconded by Mr. Adean, and carried.

Mr. Bonvoisin then alluded to the great loss that had been sustained by the death of their estimable friend, Mr. John Foster, founder and late hon. sec. of the Knights of Knightsbridge Angling Society, who, in consequence of a very serious accident had to undergo a surgical operation from the effects of which he succumbed on the 14th inst. He was one of the first who advocated and carried out the establishment of an association, and without exception formed one of each of the several deputations to the various railways, whose great privileges we anglers now enjoy. Although an exceedingly frugal man, a succession of great troubles had so impoverished his means, that upon the knowledge of such coming to the ears of the W.C.A. a committee was formed for the purpose of obtaining subscriptions for the benefit of his widow and family, which will be thankfully received by Mr. T. Ghurney, E.C.A., and Mr. T. Hoole, W.C.A.

The roll being called, the following clubs were represented—Amicable Brothers, Anglers Pride, Bostonian, Battersea Friendly, Cadogan, City of London, Clapham Junction, Cambridge Friendly, Duke of Norfolk, Duke of Cornwall, Golden Barbel, Good Intent, Hammer-smith United, Hampstead, Knights of Knightsbridge, King's Cross United, Larkhall, Norfolk, North Western, Odds and Evens, Prince of Wales, Royal George, Richmond Piscatorials, St. John, Savoy Brothers, Sir Hugh Myddleton, South London, South Belgravia, United Brothers, United Marlborough Brothers, Waltonians, Westbourne Park Piscatorials, and Mr. Ghurney, E.C.A.—WAT. B. WEBSTER.

RECOLLECTIONS OF THE LATE MR. F. BUCKLAND.

I HAD but just finished reading a few excellent notes in *Macmillan* for this month from the very able pen of Spencer Walpole, Esq., from whom such home truths are told of his late friend and fellow-traveller (Mr. Buckland), when my *Land and Water* and *FISHING GAZETTE* arrived. Upon opening the latter, my sight at once fixed upon the article, entitled "The Angler's Missing Link," which is most certainly beautifully rendered. "Who, indeed, is to replace the link now missing?" might well resound through the medium of the *FISHING GAZETTE* to all parts of the globe. Many were the anecdotes told by him, and many of him will be told; and proud am I to be enabled to repeat (through close friendship), several, at some future time. I have read in the *FISHING GAZETTE* a note upon the Right Hon. John Bright, M.P., who, it says, seldom smokes during the Parliamentary session, but, in the holidays or recess, when by loch or river, angling for salmon, the right hon. member indulges in the fragrant weed, preferring the best cigars. How fond our dear friend was of his cigar, any one who had once been in his company could testify. Early and late, in the bitterest cold, or under the heat of a tropical sun, the

fragrant weed was constantly his companion. I have accompanied him many times, when it has been blowing hard and freezing sharp, for many hours at a stretch up to our chests in the river, when moustache and beard have been crisply frozen, when a bite at a Spanish onion a cigar, and some old beer were our only warming apparatus. Again, did he, under a midsummer scorching sun, for over two hours point out to a select audience how the pass could be made by the side or round the Totness weir. Standing alone in the stream, smoking the whole of the time, seldom removing the same during the whole of the time he was speaking. Although I had known Mr. Buckland for several years, it was not until the 26th of February, 1870, that I had the honour of taking my first cigar with him. It was on the occasion of my having received an official letter from the "Salmon Fisheries" office, Westminster, to attend at the South Kensington Museum, to examine a parcel of sea-fish from Glasgow, packed in a new and ingenious manner in ice and sawdust. In this letter is a specimen of the kind-hearted manner he had of addressing his messages: "I shall be very glad if you will kindly do me the favour to come and examine them at my museum at your earliest convenience; to-morrow will do, say between 1 and 5 p.m." Being in London in February of last year on the very day of the month, ten years previously, I had smoked my first cigar presented by him; and now to call and see him seated in Doctor Hunter's chair, hard at work and very ill. By the side of whom was Mr. Ffennell, of *Land and Water* fame, arranging matters for the week's paper. During my stay everything of note and curious was shown me, not forgetting lots of heads and tails of salmon undergoing examination, having *Saprolegia ferax* attached; after which I was seated in the doctor's chair by Mr. Buckland, and for two hours enjoyed my last cigar. When about to leave, he pressed me to call again, but leaving for Devon the following morning, prevented my so doing. I hardly knew how to leave him; his good-natured hearty laugh was now but a smile, though still smoking. I wished him good day; I could not say good-bye, although I felt convinced that I should not see him again, and as the page boy showed me the way down, he remarked, "I am afraid you will not see Mr. Buckland much longer; the end is drawing near." Thus it was ten years to the day since my first and last cigar with a gentleman, who, as your correspondent "B." states, is the "Angler's Missing Link." There can be no doubt that few, very few men, would undertake to do what the late Mr. Buckland did; and it is to be apprehended that his untimely removal from labours so useful and universal will create the greatest difficulty to be experienced by the anglers, and the conclusion will be that his death will long be felt as "The Missing Link."—FRANK GOSDEN.

Exeter.

CORRESPONDENCE.

[We do not hold ourselves responsible for opinions expressed by our Correspondents.]

ANSWERS TO CORRESPONDENTS.

W. BISHOP.—The index to the volume for 1880 was published and sent out gratuitously with every copy of the paper some weeks ago—you can get it at the office. You can also get a cover there. Mr. Keene has promised to complete his Thames articles shortly, and we trust he will. Thanks for your suggestion; you must have a little bread with your jam; the jam is too expensive to use so freely as you would like and we should like, but we will do our best.

THE DACE AT TEDDINGTON.

SIR,—I am very much obliged to "Vortex" for giving me the opportunity to answer his remarks relative to the taking of dace at Teddington Weir. 'His informant is in error as to there being no river-keeper present at the time it was going on last year. In addition to the presence of our head keeper, a visit was paid by Mr. Thomas Spreckley and myself, with two members of the committee (I believe, Mr. Alfred Nuthall and Mr. P. Geen), when we decided no charge of absolute "snatching" could be substantiated. The dace were there in such numbers it only required an ordinary strike, as in common angling, to hook a fish, which was more frequently done foul than otherwise. With the exception of very few instances, which were at once stopped by the river-keeper, the would-be anglers had on their lines only one hook baited with worms. We however, decided to do what we have arranged to be done this season, "Vortex" has made a suggestion that "a river-keeper be told off for the special duty of preventing the nefarious practice," which, he says, and I hope truly, "will earn the gratitude of every true sportsman." I am very pleased to tell him that, in addition to strict orders being given to the lock-keeper (who is also a river-keeper), one of our own keepers will be constantly stationed at the weir during the heading-up of the dace, to prevent a recurrence of the disgraceful and unsportsmanlike scenes of last year. As regards the puntmen, I am sure "Vortex" will join with me in hoping they will be more alive to their own interests and the value of the fishery to be guilty of encouraging the taking of dace in such a condition. A true sportsman will be ashamed to be seen doing it at such a time.—I am, &c. W. H. BROUGHAM, 20, Moorgate St., Feb. 14.

(sec. T. A. P. S.)

THE MISSING LINK.

SIR,—Your correspondent B. is quite right in saying that the death of our lamented friend, Frank Buckland, has created a missing link. He might, indeed, have gone farther, and said a vast chasm. When, however, such an event occurs, it is our duty to do our best in every possible way to fill up the deficiency and repair the ranks so sadly broken.

Casting and painting of casts can be carried on just as well as ever. Mr. R. Edon will, I believe, do anything that is wanted in his spare time, and his work at the Buckland Museum, shows that he is no novice in the art. Of course his work will not be gratuitous: that must not be expected. His private address is 107, Arthur Street, Fulham Road, S.W.

As to identification of rare fishes, general information as to the management of water, &c., &c. (though I say this with the greatest diffidence), I shall always be pleased to do any thing I can to assist and advise those who may apply to me. Of course it is perfectly impossible to hope to do all for the public that Mr. Buckland did. We can only try to do our utmost; that is all.

In order to facilitate the early receipt of specimens, I may add that parcels should be sent to Bexley Station, S.E.R., carriage paid.—I am, &c., Cray Fishery, Foot's Cray, Kent. CHAS. C. CAPEL.

FISHING AT WINCHESTER.

SIR,—My attention has been drawn to two letters in the FISHING GAZETTE of the 5th and 12th inst. The first, by Mr. Huggett, too late to call for any reply of mine to reach you in time for your last impression. I am glad that "Resident" has lost no time in informing you of Mr. Huggett's mistake with regard to the fishing. It is true I have lost a portion of the water, as stated by "Resident," and I should have refrained from stating more, but for the vindictive spirit in which he writes of me. After the superabundance of "soft zawder," for others in the same line as myself—but of that I need not say more—"Resident" states that your numerous readers of the angling world should read "hours" instead of days (or something to that effect) that an angler might fish in the whole of my waters. "Resident" must be very ignorant, or pretends to be to suit his own purposes, of the extent of the water I have; and I challenge him or any fly-fisher, be he a resident or not, to fish the whole properly in the "four days." Now what could be more misleading than to try to make anglers believe (strangers, I mean) that they can only get four hours of good fishing on my water. Mr. Huggett wrote what he did, thinking he was simply writing the truth, not knowing of the recent changes, as, if I remember rightly, he fished my water last year. Yet "Resident" must be fully aware this portion of the water being taken up by "his friends," no doubt for the purpose of letting by tickets, it will not be a bar (as it is in some cases) to anglers from any distance, being able to fish by paying for it; therefore the angling public would not be much put out, by reading Mr. Huggett's "unreliable rubbish," as "Resident" is pleased to term it; and the idea, too, of shutting up your valuable GAZETTE, because "three men" actually think as does "Resident."—I am, &c., J. HAMMOND, Fishing Tackle Maker, Winchester.

FISHING AT WINCHESTER.

SIR,—The tone of "Resident's" letter is so unnecessarily insolent and so unlike a true disciple of Walton, that I decline a reply. I will, however, reply to your editorial note. On many occasions I have seen requests from your readers and yourself for anglers to send reports of fishing stations. From time to time I have sent such reports, which have always been from my personal knowledge and not from hearsay. I have fished Hammond's waters for the last six years, including last season, and I believe in my report I kept strictly to the truth. There were one or two small printer's errors, but in the main the report was correct as forwarded. I much regret to hear that Hammond has lost some of his fishing, perhaps he has enemies in the camp.—I am, &c., 9, Cromwell Crescent, S.W., Feb. 14, 1881. T. HUGGETT.

FISHING QUARTERS IN DERBYSHIRE.

SIR,—Would you kindly insert this in your GAZETTE, in order to correct an error in the printing of my piece about "Fishing Quarters in Derbyshire" in your last number? "Tilleford Bridge" should be "Filleford Bridge." By doing you will greatly oblige me BLUE DUN. 30 Feb. 12, 1881.

FISHING QUARTERS IN DERBYSHIRE.

SIR,—In the number of the FISHING GAZETTE for Feb. 12th inst. your correspondent, "Blue Dun," in an article headed "Fishing Quarters at Derbyshire," makes the following statement:—"Above Bakewell come the Ashford and Millersdale Fisheries, the latter may be fished by paying 1s. 6d. for a day ticket." I am at a loss to understand where your correspondent, otherwise accurate, gets his authority for this statement; but, to prevent disappointment to any anglers acting on this information, I beg to state that the Wye, between the first tunnel below the Millersdale station of the Midland Railway and the point above that station where Woodale runs into Millersdale, is in the hands of a club, who strictly preserve that water, and of which club I beg to subscribe myself A MEMBER.

Manchester, Feb. 15, 1881.

A PERSONAL MATTER.

SIR,—In justice to myself, I hope you will allow me to speak once more in this matter; but Mr. Spence's presumption is so gross that I decline further controversy with an opponent too palpably beneath my contempt. For this decision I give the following grounds. Mr. Spence has again made a false quotation, and inserted the word parr where no such word appeared. Were this the only case of misstatement, in order to suit his arguments and protract discussion, it might be slightly palliated, as accidental; but when it forms part of a general tissue of misrepresentations, twice acknowledged by Mr. Spence himself, I think I cannot allow myself to be responsible for any further falsity in others by continuing to write letters unanswerable with truth and only to be met by misrepresentation. Mr. Spence says I wrote "Parr with almost white-coloured fins." Turning to my letter of January 1st, I find the words actually printed were, "I shrewdly suspect that the almost white-coloured fins, which Mr. Spence has caught at times were real parr." By a typographical error I was made to say Mr. Spence had caught "almost white-colored fins,"—a wonderful feat—instead of "trout with" these appendages. It is in my opponent's own letter of January 15, where the words "parr with" actually appear. The heading of my first letter, or rather article, in the controversy, was "Samlets," whilst that of my second was "The Parr," and I never confounded the two varieties. It is a gross subterfuge, or worse, to state or insinuate that "The Raven" is the only person who seems to have seen the creature called "parr." In the letter of January 29th, Mr. Spence writes, he has looked over his letters and "only found the word four times." I have inspected the emanations previous to that date, and I find the word on six occasions:—1st, on Nov. 13, third paragraph; 2nd, on Dec. 4th, first paragraph; 3rd, 4th and 5th, on Dec. 11th, paragraphs six, eleven and twelve; 6th, on Jan. 15, paragraph two. In paragraph five of the letter of Nov. 13, the word "parr" is used for what should have been, I may presume, the samlet; the latter word being the term to which Mr. Spence should have adhered in describing the young of the salmon, had he meant to be understood, according to the definition given in my

first article on "The Parr." On Dec. 13th, Mr. Spence thought it advisable to state that "by salmon he meant any migratory species of salmon." How is it that, when using the word "salmonids," he did not give a similar caution as to the sense in which it was employed? The only other matter which I deem it a point of honour to notice, is the charge relating to the words "a wholly untrue statement, for parr and parr-marked fish are found abundantly where migratory salmonids are absent." The young of all salmonids that have the lateral bands, and all the adult species which retain the marking, have long been known in many parts of the country as parr, at least by the ignorant. Mr. Spence appears to belong to this class, as he confounds samlets and parr with each other, and would, therefore, presumably, do the same in the case of adult trout with the lateral markings; but as I distinguish the species I was obliged to add after the word parr, "parr-marked fish," for I know streams where there are adult parr-marked trout—that is, parr as accepted by many—and no other salmonids.

I may call attention to the fact that although the salmon family is divided into migratory and non-migratory divisions, the true trout have by others been separated into a distinct genus, as, for instance, the common trout, *Trutta fluviatilis*. The succession of mistakes, therefore, alleged against me, is plainly a tissue of errors on the part of Mr. Spence, who only blunders more grossly the more he writes.

THE RAVEN.

[In fairness to our correspondents we have inserted their letters. It is evident they will have to agree to differ; and we trust they will meet on some trout stream—they are both good anglers and north-countrymen—and have a bottle of champagne over their bone of contention.—R. B. M.]

STATEMENT OF THE THAMES RIGHTS DEFENCE ASSOCIATION TO THE CONSERVATORS OF THE RIVER THAMES.

SIR,—You published, in your last issue, a copy of a statement which was prepared by a much respected member of the Thames Rights Defence Association, and laid by him before the committee of that body for their consideration; when it was unanimously decided not to send it. I fear your readers have inferred that it had been, or was about to be, sent to the Conservators.

It is well known that I am a member of the committee, and it is equally well known that for years I have maintained that we anglers had claims upon the Conservators in respect to the proper and efficient preservation of the fish; and, since I have had the honour to represent the West Central Association on the Thames Angling Preservation Society's Committee, I have been enabled, from time to time, to report that such and such appeals had been made to the Conservators on behalf of the Thames anglers; and in each and every instance the appeal had been granted—although, in some cases, entailing considerable outlay.

If further proof is needed that the Conservators are willing, so far as they may be able, to assist the anglers, it may be procured from either of the two very best authorities, viz., the President or Secretary of the T.A.P.S., who are constantly (in the interests of anglers) in communication with them.

The Thames Rights Defence Association have—as you are aware, Sir—very important and delicate interests to defend; and I should be very sorry that you or your readers should believe that one of our first acts was the sending of such a statement as would undoubtedly have the effect of offending a body of men who, if they should be unable to render us all the assistance we desire, will, I feel sure, if properly approached, give us much valuable information and assistance.—I am, &c.,

P. GEEN.

Hill View, Chertsey.

WILL HORSEHAIR MAKE EELS?

SIR,—Will you please to answer the following question: If horsehair is placed in certain positions in water will it produce living eels? An answer in next week's paper will oblige

GEORGE HOUGH.

9, Smith Street, Farnworth, near Bolton.

Feb. 4th, 1881.

[Yes; horsehair, if placed in a certain position will produce living eels. You must be very careful to get the hair from a mare's nest and don't disturb the mare. When you angle for these horsehair eels you must be very careful how you handle them, as they will kick like Old Harry. We always use oats for bait, and ground-bait with *chaff*.—ED.]

THE LATE FRANK BUCKLAND.

SIR,—Many of the readers of the FISHING GAZETTE, who were personally acquainted with the late Mr. Frank Buckland, as well as the public generally, will be glad to read the article contributed last week by your able correspondent "B." entitled "The Anglers' Missing Link," which is a justly merited tribute of praise to the great industry and perseverance displayed by the late Mr. Frank Buckland in his devotion to everything which tended to promote the welfare and advance the science of pisciculture and to benefit the sport of angling. Though his reputation to take high rank with the leading scientific and theoretical naturalist of the present day has been called into question by one of your contemporaries, there can be little doubt that he greatly surpassed many of the most eminent men in that branch of science by his practical and successful efforts for so many years to increase the fish supply of food for the people, both here and in the Colonies. By this means he achieved his greatest popularity, which was mainly based on the thoroughly demonstrative manner in which he placed his indefatigable labours before the public. It may be questionable whether there ever has been a naturalist who has more thoroughly and usefully devoted his time to this object, and probably but few have accomplished one-tenth part of the good that he has in this cause. Numerous learned and scientific books have been written about fish and fish culture, but little real practical good has resulted until Frank Buckland devoted his energies to this particular subject. He almost commenced the cultivation of our rivers at home and elsewhere, and he also strongly advocated the protection of our sea fisheries. The scientific knowledge which he possessed, and which he ever sought to improve, he endeavoured to turn to some practical use that the public might profit by his labours, and he appeared to be never weary—both by his writings and by means of the platform; also by the laborious collection of the Fish Museum at South Kensington—in demonstrating to all how greatly the supply of fish food might be profitably increased for the public benefit. It may truly be said of the late Frank Buckland, as respects pisciculture, that he has done more good by his individual exertions in this branch of science than any other naturalist of the past or present.

He was no charlatan. He was always engaged in some genuine hard work, and doing it with all the energy and enthusiasm of his character; and he had

the varied talents of writing, dissecting, making casts of fish or animals, and he was sometimes wading up to his waist, during bitterly cold weather, in some salmon river to collect spawn to send to the colonies. He laboured both as an experienced naturalist to make that science profitable to the public, and to bring it before them in the most amusing and instructive form, hence his well-earned popularity. He was a thoroughly devoted, painstaking, humble-minded student of nature, and he went to his work with an almost childlike enthusiasm, to unfold its secrets, always eager to turn the knowledge he had acquired to some public good. Of his genial, kind-hearted disposition all were impressed who knew him, and he was ever willing and patient to learn from and render assistance to all without distinction of class.

R. D. E.

INTERFERENCE WITH RIGHTS OF ANGLERS.

SIR,—I enclose a circular, a copy of trial and newspaper report of Defence Meeting of we anglers of the River Dee, or "The Mid-Dee Fishermen's Defence Association;" by this you will note that we are in the same swim that anglers are on certain portions of the Thames, and if you would give us a little notice in your influential and largely circulating medium you will have our best thanks. The late Mr. Frank Buckland, when in this neighbourhood on an official visit, was well pleased with the thorough-going and honest evidence of our professional fishermen, and told them that anything he could do for them he would most willingly. Therefore this leads me to make this appeal for your favourable consideration.—I am, &c.,

AN ANGLER.

Ruabon.

P.S.—I myself have been very fortunate, never having been interfered with, although I have been over this now debateable water for thirty-one years, still it may be my turn next.

[We have read the report of the case and it seems to us to be clearly another case of infringement of a public right by private individuals. We trust the association will yet defeat their powerful opponents.—ED.]

A COPY OF "THE RAIL AND THE ROD" WANTED.

SIR,—Can any of the readers of your valuable journal tell me where I can obtain "The Rail and the Rod,"—South Western Railway?—I am, &c.,

R. T. R.

[It was published at the *Field* office, Strand, but we think it is out of print now.—ED.]

CLUB REPORTS.

BRISTOL GOLDEN CARP ANGLING ASSOCIATION.

The annual dinner of the committee of the above association took place at the White Hart Hotel, on Friday last, Mr. J. Haddon, chair, Mr. Parsons, vice. After the usual loyal and patriotic toasts the harmony of the evening was commenced by our worthy veteran angler, Mr. Harry Warr, who gave the "Gipsy's Tent."—Mr. Counsell proposed the Golden Carp Association, coupling with it the name of Mr. Parsons.—Mr. Parsons, in reply, thanked them for the kind manner in which they had drank his health, and was glad to say that the Golden Carp Angling Association was in a very flourishing condition. He was sorry that they had not been able to secure any water as yet, but there was every probability of getting some soon, the great difficulty was, that all the water near Bristol was overfished, and it would not suit all the members to have far to go; the committee had done all in their power to forward the matter, he was glad to say that they had a good surplus in hand, and hoped before the next meeting they would have obtained really good fishing water within easy distance.—Mr. Springbott, song.—Mr. Payne rose to propose the secretary, alluding to the work that the secretary had to do, said he was sure they could not get anyone more willing and able to do it than their worthy friend, Mr. Wride, who had always taken a great interest in the association, and he was sure no one had worked harder for the association than Mr. Wride.—Mr. Wride, in responding, thanked the members for the cordial way in which they had received his name, briefly alluded to the affairs of the association, and informed them that the balance for last year was £33 2s. 9d.—Mr. Pullen, song, "Chink, chink, chink."—Mr. Morgan proposed the Visitors, coupling it with the name of Professor Morris.—Professor Morris, in reply, thanked the company, and said that although he was a visitor at present, next year he hoped to be there as a member.—Mr. Wride, song; Mr. Wilson, song.—Mr. Parsons rose with great pleasure to propose the health of their worthy chairman, Mr. J. Haddon; he need not enlarge on Mr. Haddon's many good qualities, they were known to all, he had always taken a great interest in the association, and no one had been more energetic in securing prizes for the angling contests. He (Mr. Parsons), regretted the unavoidable absence of the president, but he did not think that the chair could have been more ably filled.—Mr. J. Haddon, in response, after thanking the company, said he had always endeavoured to forward the interests of the Association as much as possible—they had plenty of talent amongst them and he hoped the members would always work harmoniously together, and that soon the Golden Carp Association would be second to none.—Mr. Pullen, song.—Mr. Everett proposed the health of the vice-chair, Mr. Parsons. Mr. Parsons briefly responded.—Mr. Dolman, song.—The chairman proposed the health of the Host and Hostess.—Mr. W. Leigh responded, Professor Morris, song.—Mr. Payne proposed the health of the accompanist, Mr. Charley Morgan.—Mr. Charley Morgan, in response, thanked the company, and said it gave him great pleasure to accompany such talented vocalists, and regretted very much that a severe cold rendered him unable to give the "Sunday at Highbridge" song, as requested. After a few more songs given by various gentlemen, a very pleasant evening terminated.

THE CAMBRIDGE FRIENDLY ANGLING SOCIETY.

On the 9th instant Mr. Warsop had a very pretty show of roach and rudd, taken from private waters, weighing 11 lb. 6 oz., which were in splendid condition and much admired, and considering the unsettled state of the weather he is to be congratulated. They were taken in a little over two hours with bread paste.—W. SUTTON, sec.

February 12, 1880.

EUSTONIAN ANGLING SOCIETY.

We had a fine show here on Sunday last. Messrs. Hornfeck and Jones had some fine roach from West Drayton, some weighing 1 lb. 8 oz. each.—W. COSTER.

IZAAK WALTON ANGLING SOCIETY.

Three special prizes were fished for on Sunday last, the 13th inst. Mr. H. Auburn secured the first with 4 lb. 10 oz. of chub; Mr. E. Morrow was second with 3 lb. of roach; Mr. G. Wood was third with 2 lb. 5 oz. of roach. Mr. G. Manning also weighed-in roach on this day. There were several others out, but owing to the state of the rivers their takes were very indifferent. Messrs. J. Hilliar, jun., and A. Salmon weighed in salmon on the 16th inst. Three special prizes will be fished for on Wednesday next, the 23rd inst. All fish weigh according to the rules of the society. No competitor to leave London before the morning of the competition, as usual. There have been several additions made to this society's collection of preserved fish. Messrs. J. Hilliar, sen., G. Wood, and A. C. Critchfield have specimens of roach, each weighing 2 lb. and upwards; Mr. Critchfield has also a very fine dace, which weighed 1 lb. when caught; and Mr. G. P. Rolt has his splendid carp finished. This specimen weighed 9 lb. 8 oz. when caught, and was taken at the Ferry-Boat Fishery, at Tottenham—which adds greatly to the novelty—the water being so near London. The whole of the above were preserved by Mr. J. Barrett, of 11, Diss Street, Hackney Road; and, like the many others he has done for the club and the different members, are beautiful, and do him great credit. Mr. A. E. Bedford will give a handsome looking-glass, value £2 2s., for the heaviest weight of any fish (according to rule of the society) taken on the two Sundays in March. Mr. G. Wood will give a prize, value 10s. 6d., for the second heaviest taken on the same days, and same conditions.

February 17.

PECKHAM BROTHERS' ANGLING SOCIETY.

The annual dinner of this young and flourishing society took place on Wednesday in the club room, Prince Albert Tavern, East Surrey Grove, Peckham. The worthy host, Mr. Reed, provided a most excellent dinner, and also presided, the vice-chair being taken by Mr. Page. After the toast "The Queen and Royal Family," in proposing "Success to the Peckham Brothers' Angling Society," the Chairman referred to the manner in which the society was conducted, and the success it had attained in a very short period. Mr. Page responded with a very amusing speech. The secretary (Mr. W. Matthews) read his report, and gave a general review of the society from its formation about 14 months ago, when it commenced with only four members, stating that it now consisted of between 20 and 30, and financially was in a very prosperous position. Mrs. Reed (the worthy hostess) kindly presented the prizes, the winners being Messrs. Cox, Page, Matthews, Jones, Minard and Williams. Mr. Weber responded to the toasts "Our Absent Friends" and "The Visitors," and also presided at the piano. Some capital music and singing was afforded during the evening, which was brought to a close, with everybody being highly entertained in all respects.

SIR HUGH MYDDELTON ANGLING SOCIETY.

A complimentary visit was paid to the Sir Hugh Myddelton, at their new quarters, the Empress of Russia (host, Wm. Crozier), St. John Street Road, Clerkenwell, on the 9th inst. Mr. Leo. Bonvoisin occupied the chair; Will Fowler, vice, on this particular evening. The rain came down unmercifully for hours, which I have no doubt deterred many from visiting the Society who had long distances to come. We give those gentlemen great credit who feared neither storm nor rain to render assistance to the members of an old club in a new club house, and we make every possible excuse for these who did not attend. The following gentlemen rendered some capital songs:—Mr. Stevens, St. John's; Mr. Fowler, Sir Hugh Myddelton; Mr. Thos. Allard; Mr. A. Allard, Sir Hugh Myddelton; Mr. Cundall, Alliance; Mr. W. Phillips, Great Northern; Mr. P. Duncan, Sir Hugh Myddelton; Mr. Evans, Mr. Wm. Park, Mr. Chas Watling, Odds and Evens; Mr. Neal, Eustonian; Mr. Dixie, Golden Barbel; Mr. Leo Bonoison, recitation, "Frenchmen and the Rats"; Mr. Thorley, St. John's; Mr. Amies, North-Western; Mr. Say, Amicable Brothers; Mr. H. Hunt, Brothers Well Met; and Mr. Steadman, Eustonian. The roll being called, twenty-one clubs responded. A vote of thanks was given to the chair and vice-chair for their services in so ably presiding, and a very pleasant evening terminated.—G. CLABON, sec.

Feb. 14.

TUNBRIDGE ANGLING CLUB.

The monthly committee meeting of this club was held on Monday evening, at the Bull Hotel, when the Hon. H. Roper Curzon presided, and there was a good attendance. It was decided to hold the annual meeting of members on the 3rd March. The hon. secretary reported that a neighbouring riparian owner had kindly presented the society with a large consignment of stock carp, weighing 2 lb. and upwards, which had been placed in the Medway, at a position where the fishing is reserved for members only. A large pike, supposed to have been killed by otters, was exhibited in the room.

Feb. 15.

AMICABLE BROTHERS ANGLING SOCIETY.

The members of the above society will angle in the river Lea, above the Rye House Fishery, on Sunday, Feb. 27, in a pegged-down match, for thirteen prizes. Fishing to commence at 11 a.m., and finish at 5 p.m. All members to journey down by the 8.45 train. Mr. Squire saved us a blank last week by weighing-in roach and dace.—J. WORLEDGE.

Feb. 15.

CITY OF LONDON ANGLING SOCIETY.

A few of our members were pegged-down, at Watford, near the Halfway House, to fish for three prizes, only two of which were taken. Mr. Plumstead, sen., first; Mr. Castell, second. The takes were small.—CAS.

Feb. 14.

DALSTON ANGLING SOCIETY.

On the 13th inst., our members competed, at Watford, for the following fourteen prizes, viz.:—A silver-mounted set of carvers, value 30s.; four half-guineas, three half-sovereigns, a copper tea-kettle, a tea service, an electro-plated cruet, a toilet set, a meerscham pipe, and a handsome pair of lusters. And the following were the winners, in the order named, viz.:—Mr. Fortescue, Mr. Eagles, Mr. James (two prizes), Mr. Anderson (two prizes), Mr. Warman, Mr. Wainwright, Mr. Lester, Mr. Richardson, Mr. Claydon, Mr. Nunn, Mr. Finch, and Mr. Venour.—W. L.

Feb. 16.

WALWORTH WALTONIANS.

At the weekly meeting held on the 11th, at head quarters of the above society, the following members were present:—Messrs. Boalch, Bayley, Piolaine, H. Dale, J. S. Weatherhead, Sutcliffe, S. Winter, M. Renault, and Bansback. It was agreed that a competition should take place on the 14th for five prizes, the result of which was as follows:—M. Renault, 1st, with dace from Richmond; Mr. Green, jun., 2nd, roach and dace from Richmond and Mr. J. Collins, 3rd, dace. The remaining prizes will be added to those given for the competition, which will take place on March the 6th. Members are requested to attend practice for the concert, which will take place next month.—PIXIE.

Feb. 16.

SURREY PISCATORIALS.

On the 10th the members of the above competed for three prizes, viz., £2 2s., given by Mr. Cridland; a book and tackle, value of £1 1s., by Mr. Weekly; and £1 1s., given by Mr. Beckett. Mr. Boalch, Mr. Medway, and Mr. Beckett visited Shiplake in spite of the high wind and rain that prevailed. Mr. Beckett succeeded in getting a roach about 10 oz., which entitled him to the 1st prize. The other two prizes were transferred to the next competition, which will take place on March the 10th, on which occasion Mr. Peters gives £2 2s.; Mr. Medway, a roach rod, value £1 10s.; and Mr. Clarke, £1 1s. All members competing who have not won a prize during the season, and catching fish this day will be entitled to a prize before any other member.—PIXIE.

Feb. 16.

TIRED HANDS AND ARMS.—Edson's Electric Armlets and Wrist Bands. Invaluable for anglers and gun sportsmen and highly recommended for all persons having tiresome writing, sewing, or music practice. They give wonderful energy and strength, enabling the wearer to accomplish tedious work with steadiness and comfort. Price 2s. 6d. per pair, silk web and fine steel clasps. Sent to any address on receipt of P.O.O. payable to J. Edson, the Electric Fabric Co. Patentees, No. 1, Charlotte Street, Bedford Square, London W.C.—[ADVT.]

Mrs. F. Y. BROCAS, Artificial Fly Dresser, 4, Mill-street, Conduit-street, Hanover-square, London, W. A stock of best flies always on hand. Flies made to pattern. Lessons in fly making given.—[ADVT.]

GREGORY'S SPINNING BAITS.—"The Gregory," the "Flexible Cleopatra," the "Oxford," and the "Colorado," pronounced by all Anglers and the Press the best baits invented for salmon, trout, pike, and perch. To be obtained from all respectable fishing-tackle shops in the world, and wholesale from Messrs. S. Allcock and Co., Standard Works, Redditch. Flattering testimonials speaking of the efficiency of the baits have been received from the Right Hon. John Bright, M.P.; Mr. William Bailey, Nottingham; the Rev. E. C. Holt, Teddington; Sir William Calder, Kingston-on-Thames, &c. Gregory's registered Archimedean spinning tackle for pike and trout, now ready, is pronounced by the press the best ever invented. For use with dead bait. The tackle is complete in every respect, and can be adjusted to suit bait of any size. Has been tried with remarkable success.—See that the name "Gregory" is impressed on the Archimedean fins, as inferior imitations are offered for sale, and people are thereby disappointed and deceived. Address, James Gregory, Vyse-street, Birmingham.—[ADVT.]

The Fishing Gazette.

SATURDAY, FEBRUARY 26, 1881.

SHETLAND AS AN ANGLING RESORT.—V.

ABOUT two miles to the west of Walls, two small burns cross the public road, and fall into the sea at a place called Fontabrough Voe. The first, or more easterly, is slightly larger than its western neighbour and rises from two small tarns, from

which it pursues a sluggish winding course for some two miles. It is said to hold large sea-trout during floods, but neither in it nor its neighbour have we ever taken anything over a pound in weight. The western burn rises from a good-sized, but shallow loch called Loch of Song (though whence this musical name arises we know not), which we once fished, having been told that it had not been fished for seven years. Whether this information were true or not, the fish were certainly most unsophisticated, and had we not returned fully three quarters of our take our basket might have been quite as much as we could carry; but we were merciful, and the twenty-four trout we kept weighed 18 lb. The average size of the fish is about four to the pound we think, and there are no sea-trout, but we are informed that these latter sometimes take well in the voe. We cannot say whether matters have changed lately, but some years ago the road to the west of Walls used to be blocked at short intervals by walls carried right across it and composed of loose stones; to a pedestrian these were a matter of small moment, but the amount of blasphemy they would be likely to produce from an average driver, if by any chance one should find his way there, we shudder to think of.

On the peninsula lying between Vaila Sound and the Grutting Voe, lies a good-looking loch which we only mention that we may warn the angler against it. We do not think it contains any fish whatever for we have often tried it and shot round it at times, for there are always snipe and generally a duck or two at its lower end, yet we never saw a rise in it, nor have we been more successful with worm.

A friend some years ago informed us that there was good sea-trout fishing to be had at the top of Olas Voe, one of the eastern branches of the Grutting Voe. The parish, Sandsting, in which this Voe lies is a kind of terra incognita to the anglers who generally come to Walls, and if it were not so inaccessible would no doubt repay exploration by any one who could make up his mind to do so. Most people, however, will prefer the bird in the hand which the parts nearer Walls offer.

We shall now return to Flatpund Loch, which, the reader will remember, we constituted a sort of starting point from which to reach the more northern lochs. Of these the first in point of distance is Coelistes (pronounced Killister) which lies about two and a half miles, and nearly due north from Flatpund, and is only to be reached by crossing a very boggy and hilly country. Had we been asked five or six years ago which was the best sea-trout water near Walls, we would in all probability have named this loch; but "Ichabod," the glory has departed, and now we much doubt if there be any fish except common trout of a very inferior quality to be had here. Nor is this due to the usual and far too common reason for the decadence of the Shetland fisheries, too much netting, but to a barrier of sand which has been gradually thrown up across the outlet, and through which the short burn by which at one time the loch used to discharge is content to filter in a mean-spirited way. When we went there first, high tides used to all but enter the loch, but now, of course, all is changed. There used sometimes to be good sea-trout fishing in the Voe here, but, of course, this has also fallen off in proportion as the loch fishing has done so.

There is quite a chain of smaller lochs connected with Coelister, but these are in no way worthy of remark.

Over the hills to the east of Coelister, and at a distance from that loch of about one and a half miles, lie the Fogragarth chain of lochs, three in number. Of these the lowest, Fogragarth Loch proper, is the largest, being nearly two miles long and of considerable width in places. This is one of the few lochs in Shetland where we have seen the true bull-trout (*S. Eriox*), which is, how-

(This Map has been engraved specially for the FISHING GAZETTE, and is drawn from the personal observations and researches of "Scotus."
It is the only Map of the district in existence.—Ed.)

ever pretty common in the burns. Though this fish and the common sea-trout enter all the three lochs of this chain, they rise very badly and are best taken with worm, which they do much affect, *e.g.*, one day we with two friends, one of whom is probably the most successful angler that visits Walls, fished there all day. M. caught one with fly, 3 lb., the writer also, one 3½ lb., while the third member of the party did not score at all. About half an hour before the time fixed for returning home, it occurred to the writer to try worm, and in that short time he took four good fish from two to three pounds, from the very same piece of water we had previously fished over with fly without result. Sea-trout also enter the upper two lochs, of which the first is small and shallow, containing small loch trout; whereas the remaining one is larger and deep with loch-trout of good size and in great numbers.

The voe into which this chain discharges is, to our mind, especially well suited for sea-trout fishing, being almost landlocked and abounding with tangle-covered rocks rising abruptly out of deep water, the very haunts that *salmo trutta* loves.

Into the farther corner of this Voe a small ditch-like stream oozes; this comes from Loch Modeste (we are told this is the correct spelling), a very pretty little water about three quarters of a mile long, and looking very like a model of Loch Earn, in Perthshire, on the scale of 1:10. It contains superior golden-coloured loch-trout of good size and quality, and it is said that sea-trout work their way up to it by the small stream previously mentioned.

Table of distances from Walls Village:—

Walls to Fontabrough, 2 miles; to Loch of Song, 2½ miles.

Walls to Coelister, 4½ miles; to Fogragarth, 5 miles.

Walls to Blas Voe, 5 to 6 miles; to Modeste, 6 miles.

(See map.)

This completes the tale of waters in the western peninsula of Shetland with which we are personally acquainted. We have been careful to give our own experience, and where we have quoted others we have stated the fact; hence we can certify the information given to be correct. At the same time it is proper to mention that these papers were first sketched out some years ago, and though we have carefully revised them by the light of later experience, it is possible that though perfectly correct in all respects they may induce too sanguine hopes in some minds. The sea-trout fishing has not improved lately, but is still good; the burn and loch trout angling is as good as ever. We have said nothing of the sea-fishing for haddock, ling, &c., for the simple reason that we know nothing of it personally, but there is no doubt that it is very good at all times, so those who care to try it will probably enjoy themselves. Some friends of ours, three in number, were exceptionally lucky during a visit to Shetland. They were driving to Lerwick from Walls, when, as they came to Vesdale Voe, they were lucky enough to share in a whale-hunt. A small shoal had entered the bay, but not being the ordinary herring whale, but creatures of a much more resolute nature, refused to be driven ashore. My friends and the driver, Mr. Smith, of Greenland Farm, joined in the chase, and their boat was lucky enough to be "the death of three whales," the largest of which gave them fully half-an-hour's run, or rather tow. One of the party, who described the scene to us, said it was the greatest excitement he ever had in his life, and his description of an amazonian four-man crew who had got a rope round the tail of one monster of the deep, and was having a tug-of-war contest with it, was something to remember. Just as the crew had succeeded in towing their prize aboard, the rope slipped or broke, and the only male member of the crew jumped overboard and embraced their capture, or as much of it as he could, after the fashion of Mr. Briggs, succeeding in hampering its motions till help came. Such hunts are, however, the exception, and not the rule. In Shetland, the ordinary

object of pursuit is the ca-ling or bottle-nosed whale, of which almost every year one or more droves, sometimes numbering three or four hundred individuals, are driven ashore by the simple process of scaring them.

HAMPTON DEEP.

THE Deep at Hampton has always been remarkable for possessing good fish, and if an average could be made with any other similar portion of the Father Thames, it would come off more than conqueror in the capture of jack. From my own experience of something like twenty years, I am convinced more jack have been caught out of it than any other deep in the Thames; and, besides jack, I have had reports of exceedingly fine perch, and some large specimens of bream. Hampton Deep is one of the preserves as arranged by the Thames Angling Preservation Society, and approved by the Lord Mayor of London, who, at that time, was, by virtue of his office, "Conservator of the River Thames." The preserve extends from the west end of Garrick's Lawn (including the tumbling bay) to the lower end pile below Moulsey Lock, a total distance of 1514 yards. What is meant by a preserve in the present day, is this, that it can only be used by anglers—eel baskets, grig weels, and such-like devices for catching fish, are entirely prohibited, and where eel-lines were allowed, they could not be permitted in these preserves. For several years a monster pike was known to tenant this famous deep, and many an angler's patience has been taxed in waiting for him; he has, at times, favoured some of the piscators in getting hold of their bait, and then either smashing the tackle or releasing himself in some way or other, he has left his opponent in the greatest dismay and got away. I remember one of our well-known Thames anglers trying for this monster, and who really did get him on, but one of those common mistakes was made of holding his line too tight before the fish had fairly gorged the bait, and so broke away. The fisherman who accompanied him, was fearfully savage at the unfortunate escape of the monster, but as it has since turned out, the same fisherman has piloted a more fortunate captor, who succeeded in the capture of the fish. It is now about three years since the event took place, and as may be imagined, occasioned no ordinary excitement. When the monster was safely secured, it was taken first of all to the Island Hotel, the grounds of which are close to the deep, and was there weighed by Mr. T. G. Tagg, the worthy proprietor, and made 28 lb. It was afterwards shown at the Castle Hotel, kept by an excellent piscator, Mr. R. Gutteridge, and from thence it found its way into the skilful hands of Mr. John Cooper, of Radnor Street, to be carefully preserved. In due course it was completed, and afterwards exhibited at the Island Hotel, and then at the Castle Hotel, as a specimen fish, creditable alike to the successful captor and to the taxidermist's skill in setting it up. This fish may be regarded as the largest pike taken out of the Thames. The same fisherman, some years previously, piloted an angler to the capture of the second best fish, one of 25 lb. There is, perhaps, no other fisherman living on the Thames, that has landed two such fish for his patrons. But Hampton Deep is not noted alone for having possessed a champion Thames fish; it is remarkable for the quantity of jack that has been taken out of it. As a rule, the anglers never go away dissatisfied—they generally find ample sport—and the fishermen of Hampton and Moulsey are always ready to supply numberless instances of remarkable takes, which will in many cases bear verification. It has the particular and special appearance of jack water, and those who have never fished there before, would be impressed at first sight with it. In addition to the island on which a capital hostelry has been erected there is another small island; but the water running between the

Middlesex shore and the two islands, is what is known as the Hampton Deep, and I have not unfrequently seen as many as six and eight punts at work at the same time without interfering with each other. The Moulsey fishermen are amongst those mainly employed by anglers, as it is about equal distance between Moulsey Lock and Hampton Ferry; but there are plenty of punts and fishermen at the latter place. It was at the point of this deep about two years ago, some 20 brace of carp, presented by Mr. Henry Farnell, of Thorpe Hall, near Colchester, were turned into the Thames, so that altogether, Hampton Deep has no ordinary attraction to the anglers, and I would strongly recommend, if there is another chance this year, a trial of it by those who have never fished it before. Without depreciating the character of others, there are few fishing stations on the Thames possessing a better class of fishermen than East Moulsey—the names of W. Milbourne, T. Davis, T. Wheeler, John Smith, T. Watford, C. Davis, Rogerson, and Griffin being specially familiar to anglers who have fished this neighbourhood. Of the Inns there are at East Moulsey—the Castle and the Carnarvon Castle; at Hampton Court—the well-known house of the Mitre, and on the island in the very centre of the deep, is the Island Hotel. The Hampton Court Station on the South-Western Railway is close to the river. The only difficulty there may be at the present time will be to get bait, as already the dace are going up to their spawning grounds, and few are to be had. Still, the Moulsey fishermen, if they have sufficient notice, will do their best to get them, and, as a rule, are mostly prepared with a supply during the season. It is to the jack and perch anglers the Hampton Deep at this particular time possesses special attractions, and my observations as to the fishing there are not grounded upon any particular occasion, but from the experience of years, as I consider it unjust either to praise or condemn any portion of the Thames by a single, and, it may be, an exceptional visit. I might here remark that about two years ago Mr. J. C. Chubb, fishing with old Tom Davis, a little distance above the deep, near to the waterworks, caught in the year, on two separate occasions, a pike of 22 lb. and one of 17 lb., and both in the same swim. Since writing the above I have been shown by a friend a very capital short stiff rod for trolling, made by Messrs. Alfred and Son, of Moorgate Street. It is for use in waters surrounded by bushes, where a long rod could not be used on account of the overhanging boughs, but where a short rod of this character, only 8 feet in length, is really most useful: and being made strong, with large rings, is best for the angler who is compelled to seek his fish among the beds of weeds surrounding water of the above character. My friend was successful in landing five good pike, weighing from 5 to 12 lb. each, with his rod, which he could not have done if using one of the ordinary length.

B.

AMATEUR SEA-FISHING.

(Continued from page 75.)

OUR papers upon sea-fishing would scarcely be satisfactory did they not include some remarks upon the various baits used in general to lure the prey, added to which some knowledge of the nature and habits of these baits may assist to render the amateur fisherman less dependent for a supply upon others.

The lug-worm, named scientifically *arenicola piscatorum*, is a great favourite with all salt-water fish which feed on a sandy bottom. They are by no means an agreeable-looking creature either to look upon or to handle. They are not unlike a caterpillar with an elongated tail. They will not bear much rough usage, and if they are severed or bruised in digging them out of the sand—their natural habitat—they are rendered useless, being full of blood, and a soft substance resembling eggs, of the size of

small mustard seed, which escapes at any wound, leaving nothing but the empty skin which has no attraction for the fish. Moreover, if this blood and matter should come in contact with the more perfect worms it will poison the whole, so that every care should be taken to keep any mangled portions out of the receptacle the bait is carried in. The lug-worm will not keep fresh more than a day or two at most; it shrivels up and turns putrid; for this reason it cannot be used too soon after it has been extracted from the sand. It is found in many parts of the coast, in estuaries and harbours, and between rocks. Those hillocks so observable on the surface of the sand after the tide has retired are the sure indications of their presence. If you dig down and around these you will find these worms which vary in thickness from the thickness of a cedar pen to the circumference of an inch, and in length are from four to six or seven inches in length.

The rag-worm, mud-worm, or rock-worm (*nercis*). There are of this worm two varieties, one of about three inches in length, the other often of six inches. The former is found in mud-banks, the latter under stones, partly embedded in sand, cracks of rocks, and most hiding places on the shore periodically covered by the sea. In many favourable localities girls and boys obtain their living by digging the rag-worms out of the greasy black mud with their hands, and preserving them in water-tight boxes, supplying them with fresh sea-water once or twice a day, and removing every particle of filth and all bruised worms. These worms are of a pure pink or salmon colour, of a flat form, have a number of very short legs along their sides, giving them a serrated or saw-like appearance, and are almost always in motion. Sea fish of all kinds, as well as the fresh-water eel, evince a great partiality for them. On some parts of the coast they are sold in small measures not larger than a wine glass at one penny a measure, and three or four of these are generally sufficient for a day's fishing for whiting-pollack. They should be kept in a wooden box with a cover, and in the shade, for the influence of the sun turns them sickly. They are well deserving all the care that can be bestowed upon them, as they are a very superior and attractive bait. The larger ones may be kept in almost dry sand, or amongst leaves of the sea lettuce, which is obtained in harbours or sheltered coves, in the summer and autumn. Wilcocks says, "Put them in a box with this weed, as between the leaves of a book, and they will live several days. If you have any broken pieces place them in a box by themselves and use them first, or, as before observed, they will poison the healthier ones."

The white sand-worm (*nercis vesicolor*). This worm must be looked for principally in bays and harbours, and although it frequents much the same soil—oozy sand—as does the lug-worm they are never found together. Most kinds of fish are fond of them, but they are irresistible to the atherine or sand-smelt. Only a portion, and not the whole, is enough as bait for the latter fish. They use the same, or very similar, worm on the Welsh coast for whiting fishing. It is found from two to eight inches in length—the latter size exceptional—and will keep alive in sea water very frequently changed for a week or ten days. The old salts think little of it, but we have had rare sport with the white worm amongst sea-bream, pollock, wrasse, atherine, &c.

It is a common notion that the inland earth-worm is useless as a bait in salt water; no more erroneous notion can exist. It may be true that the rag-worm surpasses it, but the rag-worm is not procurable on many districts of the Welsh coast, and the earth-worm is almost everywhere obtainable, and that in abundance particularly on grass lands and flower beds on a dewy or v. evening with a lantern and a velvet tread. They should be treated as for fresh-water fishing; put into a tub with a little ear dead leaves, and plenty of moss, taking care to pick out occasionally the dead or diseased ones, and bringing the whole

them up from the bottom to the surface that they may work through the moss and thus cleanse themselves.

The sea tape-worm locally called the barm is a far larger worm than any of the preceding and flatter in shape. It is a tempting bait for whiting, pout, bream, and other fish. The same care should be taken with those in separating the broken portions as with the lug and rag worms.

The sand-eel and launce (*ammodytes lobinus*, and *ammodytes lancea*) are very plentiful on most of the sandy shores, where they bury themselves during each receding tide. In Picardy, &c., where the fishermen's wives and daughters gather the baits for the men, an iron rake is used to take them in the loose sand, or a small iron hook like a sickle or reap hook, with a very blunt but jagged edge that it may hold the sand-eel and launce without injury. It is interesting to watch the dexterity displayed by the women in their captures of these silvery elongated little fish. Wilcocks, whose intimacy with the Channel Islands has been of long standing tells us that during moonlight nights many "Launcing parties" as they are called, are made for a visit to the sands at low spring tides in summer and autumn, and sometimes quite a saturnalia is held. In the island of Jersey from the abundance of the sand-eel, one of the beaches has received the name of "Grève au Langon," that is Sand-eel Beach. They are greedily devoured by all sorts of fish.

Couch gives us a description of two launces (or, with him, sand-eel), and adds a lively account of the enemies they have to contend with. They swim in companies of a few scores or hundreds, and in the quiet days of summer are seen at a small depth in the water as they are pursuing their lively course in bays or harbours, where, however, their fate is usually an unfortunate one. Unable to protect themselves, they are an attractive prey to the hungry rovers of the sea, who here and there make a plunge into the midst of them, to the momentary terror of the little host. They are scattered for a time, but they gather closely together again, only, however, to be broken in upon by another and another plunge, until at last they find their safety in diving into the soft sand of the bottom, beneath which the pointed process at the extremity of the under jaw enables them to bury themselves, and in which they lie concealed without injury to themselves, even when the tide has ebbed and left their hiding place uncovered by the water. But it is not only that this fish is able to find its way to shelter in such a remarkable situation, they are able also to move about in it with ease and some degree of quickness; for the better accomplishment of which there appears to be at the root of the tail a special organisation, of which the blood vessels are visible, and something corresponding to which exists in all fishes which possess the power of penetrating into the sand or of covering themselves with it. It is in this retreat, concealed and sheltered with the sand of the shore, that this smaller launce sheds its roe; and this it does as it holds a tortuous course, the grains being scattered as it passes on; and in the west of the kingdom at least this process is accomplished at about the shortest days of the year. It often happens, however, that their hiding place is broken in upon by worse enemies than the prowling natives of the deep, and people who value them as a delicacy for the table, resort to their retreat with hooks or rakes and thus draw them up to light. But we are told by those who have been accustomed to this practice, that if the launce be touched with the hook on the posterior part of the body, it will move away through the sand with such celerity as scarcely to be again overtaken so that it requires some skill to succeed in what might appear so easy an employment as raking these fishes out of the concealment of the sand. The larger launce will make a meal whenever it has the chance, of its lesser brethren. It is a belief among the fishermen that when mackerel are discovered to be in pursuit of the

larger or wide-mouthed launce, a less successful fishery is expected; but when these lesser fishes are the object of their rapacity, the fishery shows itself much more profitable. At times these creatures collect on the surface in larger shoals, when if discovered by the porpoises who dive under them the better to devour them, they become so bewildered as apparently to lose all powers of escape either from the porpoises below or the gulls above, the former munching them by mouthfuls, the latter dipping down and picking up the little silvery creatures with amazing rapidity. Although such occasions are rare, when they do occur the fishermen scull up to the shoal and with a small meshed landing net, like a pool shrimp net dip the net, full to the ring, thus getting a large supply with little trouble.

(To be continued.)

A NEW "SOLE-SKIN" PHANTOM MINNOW.

IN the spring of 1879 we noticed an artificial minnow which was called by Mr. R. B. Lee, of the *Kendal Mercury*, a "quill minnow," and it was invented, he informed us, by a Mr. Robert Garnett. We, therefore, christened it the "Garnett Quill Minnow." Up to that time its sale had been merely local, but after our notice appeared it increased wonderfully, and some thousands were sold before the end of 1879, since then the sale has increased, and we notice that this "quill minnow" is now made by several tackle makers and sold by all.

We mention this because we are very glad to have been the means of introducing such a capital bait to anglers all over the country. We now have a real improvement in the make of the celebrated phantom minnow to bring before them, which has been patented by Messrs. Little and Co., of 15, Fetter Lane. The improvement consists in substituting for the ordinary glazed silk skin, a piece of real sole-skin. This is very nicely shaped and coloured, and as it is one of the toughest things we know, and yet soft, transparent and pliant in the water, we think that Messrs. Little have hit on a good thing. The ordinary silk-skin soon rots and tears, in fact we have known a jack's teeth to tear the whole silk off. These sole-skin bodies with the natural scales on them look very natural in the water, and we venture to predict that Messrs. Little will have a very large demand for them, especially as we understand they have wisely determined to make no increase in the price over the ordinary silk phantoms.

EPITAPH ON AN ANGLER.

A FRIEND sends us the following epitaph on an angler; it is brief and to the point:—

"HOOKED IT."

ANGLERS should always be provided with something to take away the swelling and poisonous effect of the bites of insects. They should also have with them something to apply to a cut or sprain. Pond's Extract reduces the swelling and inflammation, stops bleeding and pain, and hastens the healing process in case of any wound or sprain; and it has no equal for application to the bites and stings of insects. Therefore never go on a fishing excursion unprovided with a bottle of Pond's Extract. It is for sale at all chemists, at 2s. 3d., 4s. 6d., and 8s. 6d. per bottle.—[ADVERTISEMENT.]

TIED HANDS AND ARMS.—Edson's Electric Armlets and Wrist Bands. Invaluable for anglers and gun sportsmen and highly recommended for all persons having tiresome writing, sewing, or music practice. They give wonderful energy and strength, enabling the wearer to accomplish tedious work with steadiness and comfort. Price 2s. 6d. per pair, silk web and fine steel clasps. Sent to any address on receipt of P.O.O. payable to J. Edson, the Electric Fabric Co. Patentees, No. 1, Charlotte Street, Bedford Square, London W.C.—[ADVT.]

GREGORY'S SPINNING BAITS.—"The Gregory," the "Flexible Cleopatra," the "Oxford," and the "Colorado," pronounced by all Anglers and the Press the best baits invented for salmon, trout, pike, and perch. To be obtained from all respectable fishing-tackle shops in the world, and wholesale from Messrs. S. Allcock and Co., Standard Works, Redditch. Flattering testimonials speaking of the efficiency of the baits have been received from the Right Hon. John Bright, M.P.; Mr. William Bailey, Nottingham; the Rev. E. C. Holt, Teddington; Sir William Calder, Kingston-on-Thames, &c. Gregory's registered Archimedean spinning tackle for pike and trout, now ready, is pronounced by the press the best ever invented. For use with dead bait. The tackle is complete in every respect, and can be adjusted to suit bait of any size. Has been tried with remarkable success.—See that the name "Gregory" is impressed on the Archimedean fins, as inferior imitations are offered for sale, and people are thereby disappointed and deceived. Address, James Gregory, Vyse-street, Birmingham.—[ADVT.]

RIVER REPORTS

MID-THAMES.

"Silence is only commendable
In a neat's tongue dried, and a maid not vendible."

—SHAKESPEARE.

Mine is not a neat tongue, or usually very dry, nor am I a maid, so silence would not (acting up to the above quotation of the immortal William) be commendable on my part, although I must confess I have little of interest to impart. The river, I am glad to report, has rapidly gone out of flood, and is really now for the first time for many a week, in tip-top roach, perch, jack, chub and all-round winter trim. At Bray, Maidenhead and Cookham some good catches of perch and chub have been had, also ditto at Marlow, by a canny "Scott"; and by Mr. O. Wright, the latter good and unostentatious angler getting one perch of 3 lb. odd amid a shoal of minor beauties. At Reading lately more than 100 Wycombe trout have been turned into the river at the expense of the local angling association; the fish weighed from $\frac{1}{4}$ lb. to $2\frac{1}{2}$ lb., and the situations being chosen by the bailiffs, it is hoped the spotted leopards will take to their new home kindly, be fruitful and replenish the water, and not take to any flight, but that of a good angler.

THURSDAY EVENING.—River dropping down to a lovely mignonette tint. Now or never is the time for the scales to drop from the eyes of a Thames angler—at any rate for this season—the end of which is so unfortunately near.—MARLOW BUZZ.

Thames (Goring).

Water getting in good order for all-round fishing. Sinking fast. If the wind will only get in a warmer quarter there will be some good fishing by Sunday.—J. RUSH.

Thames (Kingston).

The river is getting in fine condition for roach and perch fishing. I have seen some nice roach, from a dozen and a-half up to three dozen, and up to 1 lb. per fish, and some good perch weighing 1 lb. to $1\frac{1}{2}$ lb. Should the weather keep dry, and the water continue to fall as it has done these last few days, there will be good all-round fishing at the beginning of the week. At present the water is so cold the fish will not show on the shores.—JOHN JOHNSON.

Thames (Monkey Island).

There has been very little fishing lately. A punt out on Sunday had a few very good roach and chub and half-a-dozen perch. Perch are now getting very forward. Some bank anglers have had good sport on the grass ledgering. They took some very fine roach and barbel. The barbel seem to have benefitted by the floods; they are as fat as pigs. There has also been some fine trout taken ledgering with tail of lob. The jack seem to be on the increase in our neighbourhood. Last year these were several of these fish taken during the floods from 2 lb. to 4 lb. each. Providing we have no more snow or rain, chub and roach fishing ought to be good by the beginning of next week; jack also might also be had in corners and round the boughs with a paternoster and nice little bright bleak or dace.—R. HAMMOND.

Thames (Richmond).

The river is now in very fair fishing condition, though we had a lot of snow on Sunday night last, and some more of it all Wednesday afternoon, but it has not affected the river yet. H. Whales, Job Brain, E. Brown, and J. Bushnell have been out twice this week. The roach have not fed very freely, but there are six and seven dozen of dace to be had a day for those who like dace-fishing, and they run a good size. Some of the dace are very rough now, and gentlemen should throw them in again, as they are not fit to eat.—JOHN BUSHNELL.

Thames (Teddington).

The water is getting quite clear and running down fast, and in good order for fishing. The wind is north-east. There have been some good takes of roach, the largest being $2\frac{1}{2}$ lb., by Mr. Edwards.—J. BALDWIN.

Thames (Twickenham).

I am pleased to say the water has gone down considerably in the last two days, and is a good colour for angling. We have made a commencement this day; one punt had seven dozen good-sized fish. N.B.—Intending visitors will greatly oblige by sending post-card by Saturday morning's post, if convenient.—ALFRED PERRIN.

Thames (WindSOR).

Since my last, water has run off nicely, being $2\frac{1}{2}$ feet lower. Consequently angling can now be carried on from the banks, though they are left terribly greasy. As regards its condition a few days only is required for it to be in the prime order, allowing we have no more rain or snow. A consignment of the latter reached here yesterday, but will affect the water very little, and the few days left of the season ought to result in some good bags of perch, jack, and chub. The latter are in splendid trim this time of year, and will show some sport. The best bait is doubtless pith or spinal cord of the bullock, which should be got quite fresh, and boiled five minutes, using boiled brains, sheep or bullocks, as ground bait, in small quantities, thrown just above the bait,

according to stream. If unable to procure good greaves use the whitest pieces for hook, and rest for ground bait, or whitish cheese worked into a paste, and a piece about the size of a hazel nut for hook, chewing small quantities, and throwing occasionally in the swim. If some goods swims are tried excellent sport will be had with either of the above baits, but pith and brains for preference.—B. R. BAMBRIDGE.

Barle and Exe (Somerset).

These rivers could not be in better order for fishing; but, owing to the bitter north-east winds we are having, of course, angling is at a standstill. Should the wind veer round to a milder quarter, and the weather become warmer, good fishing may be looked for. The fish are getting in much better condition since the late floods. Sport during the past week has been almost nil. A few trout have been caught, but very few.—W.

Dove (Derbyshire).

On Saturday and Monday there were plenty of rodsters out on this river, which had run down into moderately good fishing condition. Chub and roach were fairly on the feed in the slacks and lay-byes, and I hear of several gentlemen getting nice takes of grayling. One, indeed, below Rochester on Friday, caught $5\frac{1}{2}$ brace with the winter duns. On the Dove's tributary, the Henmore, $2\frac{1}{2}$ brace of trout fell victims, but the fish on this stretch of water at least, if on no other, appear somewhat weakly. By the way, some ova of the Wandle trout were some time since placed in the Dove, and the fry are now said to be making good progress. Since Tuesday there has been nobody out, snow lying nearly a foot thick on the ground. We are sure to have a big rise, if not more floods when the thaw sets in.—THE SPLODGER.

Exe (Exeter).

In my last I informed you that we had reached the thirtieth hour of rain, which did not actually cease for twenty-four hours after, consequently you may guess the state of the river during the remainder of the week. So that we had nothing but gloomy forebodings as to whether we should get any fishing during the week; but all seemed to vanish as the river got lower. But a raw, cold east, by south wind settled upon us, and still continues, and the ground so beautifully soft, it is only those of the most determined that will attempt it. Several were seen returning midday yesterday, looking as though they had been following hounds on foot through washy clay, their creels apparently much lighter than in starting. I have only heard of two or three trout having been taken, but as yet have not seen any. I have not wet a line myself yet, but have been with those that have—success none, the principal topic being what flies to use, and which will be the best when the season will permit. Quantities of roach have been in the market during the week, they had all been netted; also a few founders. Other kinds of fish very scarce, the estuary men doing nothing. Brixham fish very scarce, the market being principally supplied from the North Sea. Several salmon on sale, but they are from London, and fetch from four to five shillings per lb. During the past week the numbers seen in the Exe have fallen off, but should we get a milder change they will get up into the more shallow parts of the river, when, if willing, they will meet with a real and artificial minnow reception. I shall have something to say in my next about a "Peacock" bait, something about 12 inches long, said to be most killing, which I have no doubt it is, if "frightening" will kill fish (that is doubtful). At any rate I hear it is to be tried at Slapton Ley. Slight frost, but dark, and every appearance of snow.—FRANK GOSDEN, Exeter.

Exe (Tiverton).

The water is of a pale-green tint, but very transparent, showing the presence of snow. The prospects for the next few days are not encouraging, with a rising barometer and a keen N.E. wind. Should the wind veer round to the S.W., and some rain fall, then some good sport would be had. Indifferent sport has been obtained in fly-fishing for trout, the flies killing best being blue upright, blue silver twist, and half-stone.—W. MUDFORD.

Lea (Cook's Ferry).

On Saturday, the 19th inst. Mr. Collyer, one of the members of the Edmon-ton and Tottenham Fishing Club, had a fine take of tench, one weighing eight pounds, one six pounds and a half, and one, one pound and a half, three in all, weighing sixteen pounds. Mr. Mossey, one of the members of the same club, had a fine tench on Sunday, weighing seven pounds, less a half ounce. These fish were shown at the club, and those who saw them expressed pleasure in the success of the two above named members, who have at all times laboured hard for the benefit of the club, and being in possession of the two prizes which stands for patience and perseverance, which should be the anglers' motto. In reading the club reports I see that several go for prizes; I feel sure that if a visit was given to these waters they would return light-hearted and no doubt prize-winners, as the waters are in fine condition.—SAMUEL SEWELL.

Lee (Co. Cork).

The Lee has been in good fishable order during the week, but a cold easterly wind has interfered materially with sport; however, there has been a few good days, and everything so far promises well for angling prospects when the weather moderates a little. Sir Augustus Warren has taken eight springers since the season opened; Mr. Pratt, five; General Bud, two; Dan Riordan, a professional angler, five; John Manning, four; T. Connell, one; Geo. Haynes, one; J. Lambkin, one; Mr. Gumbleton, two. Weather continues cold but fine.

Ouse and Ivel (Blunham).

Very little fishing has been done this week. Should we have no more rain it will be in excellent fishing condition by Saturday.—T. E.

Suir and its Tributaries (Clonmel, Ireland).

The river has cleared considerably for the past week, and we heard yesterday of the first fresh run salmon being killed by Mr. William Bagnall, weighing about 12 lb., and from this week out we expect to hear of a good number of the rod fishers being the successful captors of many good spring fish. The cot-men did very well for the past week, killing 21 salmon, the largest weighing 32 lb., 4 more turned the scale at 28 lb., and the rest averaged 20 lb. each. This week they are killing more fish than last. The trout fishing is still improving. Major Topplin had a good day on Saturday with Martin Power on the Lenawn, killing 4 doz. and 2 trout. Mr. Middleton got some very good trout on the Arrow, with fly and Devon bail. The Suir is now getting in good order for trout as it is very clear and falling rapidly every day. The trout are in better condition than could be expected at this season. Captain Dixon and

Mr. Park, on the 18th, and three days' fishing on the Finisk, getting about eight or nine dozen trout. The best flies for present fishing are gold spider-wren, rats' fur, hare's ear, silver black hackle, &c.—DORA.

Trent (Alrewas).

As the season came in with floods and thick water, so it seems determined to die out. Accounts from every quarter are of the most despairing character, and at present, like the past few weeks, angling is a complete dead letter, as far as the rivers are concerned. Everything, the latter end of last week, was looking favourable for an early recommencement of hostilities among the finny tribe, but a heavy snowstorm in the Midlands, on Tuesday, quickly upset all calculation. The rivers to-day are running bankfull and much discoloured from the melted snow; the only chance of any fishing is in the lakes and sheets of water inland. Two friends of mine had a day at Earlswood, on Monday, and brought home a few nice jack packed in moss, to give the bag a more important appearance. The fish, I learn, were in first-class condition and were taken with Gregory's artificial clipper. A friend of mine, residing at Newark, writes me this morning six inches of snow has fallen in his locality; another flood imminent, and concludes, "All hopes of fishing in the rivers before June 16, at an end." Let us hope not.—JAMES GREGORY.

Trent (Nottingham).

The anglers on Saturday, Feb. 19, got a fair start, with everything in their favour. Though the wind at the time was blowing rather cold, the water was in good condition, there being plenty of colour in it. When this is the case, the fish will be found to bite freely at worms, although the temperature be low. Two anglers made their way to the Weston length, and, though they did not commence before eleven o'clock and left off at three, they succeeded in capturing a splendid basket of roach, several of them going a pound each, and one, a perfect beauty, weighing 1 lb. 5 oz. Several other rosters got the roach well on the feed at Burton-on-Trent. The sample was also very good, all of which were taken with worms, and for once some of our local fishermen had fair sport among the roach and dace. Monday, however, was a great day, though some of the anglers refused to venture out on account of the wind blowing from the east, which they do not believe in for roach-fishing—quite a mistake, to my thinking, and I will give a reason. All practical fishermen know perfectly well that there are certain spots on the Trent that it would be impossible to properly fish with a float unless the wind was coming from the east. An instance I will give that came off on Monday. Two anglers went up to Weston—one a professional, the other a friend. Now, the former said the wind is exactly the thing for our top shop; we must go. The result was a good basket of fish; and I will add that, had the wind been blowing from any other quarter, they could not have fished the swim a little bit. A Derby angler also visited the same water, and succeeded in killing the best sample of roach that has been seen this winter. Then followed another heavy fall of snow, which completely put a stop to rod-fishing for the time. Half of the snow went away quickly, but a frosty night or two put a check on it getting into the river, and at the time of writing the water is nearly at winter height and getting quite clear, so that if there is no change takes place in the weather the water will be right for chub and pike fishing in a day or two.—W. BAILEY.

Wye and Derwent (Derbyshire).

No sooner are the angling fraternity expecting to have some good sport amongst the finny tribe, than down comes a deluge of either snow or rain, which quite knocks fishing on the head again. On Monday night, we had a very heavy fall of snow, which has quite put a stop to angling for a few days. The weather is too keen for the fisherman to be out at the water side, although both rivers are getting into good condition for all kinds of fishing. During the time the last flood was out there were two pike killed down in the meadows close to Cromford, that had been washed out of the Derwent and left in the fields, they weighed 6 lb. each. No doubt we have very many pike in the Derwent now; in fact, I believe, we have great numbers, but they are very difficult to be caught, owing their having so much feed in the Derwent. I have heard several gentlemen say that they would as soon eat a pike out of the Derwent as either trout or grayling, for their food is chiefly trout and grayling. I see there are several mistakes in "Blue Dun's" remarks respecting the "Fishing Quarters in Derbyshire," which might lead anglers astray. In the first place, he says that "anglers staying at the Peacock Hotel, Rowsley, have the choice of fishing in two rivers." Now, this is not the case, as Mrs. Cooper can only give fishing tickets for the Wye, from Filleford Bridge to Bakewell Bridge; and Filleford Bridge is a good distance for the angler to walk before he can commence his fishing. The Derwent belongs to the Darley Fishing Club, and Mrs. Cooper cannot give tickets for this fishing. So that, if the angler does not belong to the Darley Club, or has some landowner's ticket given to him, he cannot fish the Derwent. And another great drawback to anglers who desire to fish the Derwent, Chatsworth Fishery, they cannot procure a fishing ticket at Rowsley. They have to go to Edensor, to the Chatsworth Hotel, before they can procure a fishing ticket, which is a very long way for the angler to go before he can commence his fishing. The price is 2s. 6d. per day for your fishing ticket. I consider the Chatsworth Fishery the best fishing we have in Derbyshire; in fact, I can always kill more fish off this water than either the Wye or any other club's water on the Derwent. The Wye gets sadly too much over fished, every season becoming worse and worse, and the fish scarcer. No doubt the disease has had a lot to do with the scarcity of fish in the Wye. I have seen, I should say hundreds of times, between Filleford Bridge and Bakewell Bridge, from twelve to twenty rods on the Wye, thrashing the water in all shapes and forms. The fish in the Wye know what an artificial fly is as well as the maker himself. About the middle of June or July I recommend anglers who wish to come down to Derbyshire on purpose to try the Wye, to go direct to Bakewell, and by staying at the Rutland Arms Hotel for three days your fishing will be free on the Wye. By going to Bakewell you are close to your fishing, and the accommodation is first class and the charges very reasonable. Mr. Wm. Greaves is the landlord of the hotel. The Peacock Hotel, at Rowsley, is a good place for anglers to stay at, but it is too far off your fishing quarters, unless you belong to the Darley Club. "Blue Dun" also states that the Ashford canal, Miller's Dale fisheries; the latter place can be fished by day tickets; by paying 1s. 6d. per day, for your fishing ticket. This statement is quite right, for I know every inch of both the Wye, Derwent, and Dove; and this fishery he alludes to is strictly preserved by a fishing club, and leave is very hard to be got. To fish this water, in fact, any of the water between Bakewell and Miller's Dale. I quite agree with "Blue Dun's" remarks respecting the number of flies, &c., in last week's FISHING GAZETTE. If the generality of anglers would only use hackle flies with the proper hackles and the proper bodies, then their sport would be much better. I see hundreds—I might say thousands—of flies every season, both hackle and

winged flies; these look like killing when they are dry; when they become wet the colour is quite different. I am sorry to say we have very few good judges of colour fly makers in Derbyshire now; in fact, I really do not know one.—GEORGE JAMES EATON.

Yare (Norwich).

The water is still high although much brighter, and there is every prospect of a good angling season. Mr. Geo. Webb and Mr. W. G. Capon, were out again this week, the former securing a fine basket of bream on the Thorpe Broad, and the latter a nice take of roach at the same place. Mr. Capon, who is an authority, assures me that the river, from Norwich downwards, as far as Coldham, teems with fish, and should we be favoured with southerly winds shortly, some extraordinary catches will be reported. Messrs. Palmer Brothers, having had leave from R. Colles, Esq., of Norwich, tried his private waters this week for pike, but only two or three small ones were landed, as the water is still unusually high. Three gentlemen from Norwich went to Scoulton Mere (famous for its black-headed gulls) this week, and succeeded in taking twenty-eight pike, the largest weighing 25 lb.; fortunately for them the day was exceptionally fine, which added no doubt greatly to their success. Roach and bream are now well on the feed, and plenty may be taken with red worm. It is greatly to be hoped that all members of Clubs, as well as other anglers, will return undersized fish to the river again this season, as there is more gratification in showing half-a-dozen good fish than forty undersized ones.—ANGLER.

Yore (Yorkshire).

I had arranged to have a day among the grayling on Wednesday last, as the river had got into better condition than it had been for weeks, but a heavy fall of snow on Monday night once more spoiled sport. A thaw followed, as usual, and a correspondent in Wensleydale sends me word that snow lies very thick upon the hills higher up the valley; so that before the snow water can get out of the river, all hopes of grayling fishing will have vanished, at all events until August or September comes round once more.—FRANCIS M. WALBRAN.

FISHING QUARTERS.—ALUN.

THE river Alun, Alyn, or Allen—as it is variously spelt—has its rise in Denbighshire in a mountain called Cynin-y-brain. It becomes fishable at the village of Llandegla, a couple of miles from its source, where capital sport is to be obtained, but the trout run small—about five or six to the pound. The river here, for about three miles, is now, I regret to add, most strictly preserved, and leave is exceedingly difficult to obtain. Then comes a stretch of open water, from Llanarmon to Rhydymwyn, a distance of about eight miles. This portion of the river affords very good fishing—the fish going about four to the pound. Netting is said to be carried on here to some extent, though without apparently diminishing the stock of fish. Here, on one occasion, I killed, in a quarter of an hour, eleven fish, averaging three or four to the pound, without moving from one spot; trout must therefore be plentiful. Now comes a stretch of water which I cannot recommend; the river being much polluted by the lead mines in the neighbourhood of Rhydymwyn. At Mold the river is again polluted from the manufactures carried on along its banks. Trout however, singularly enough (for the water is quite red from the abominations discharged into it) are here in plenty and of a larger size—the average being about $\frac{1}{2}$ lb. Fly-fishing is out of the question in this part of the river, but worm-fishing is practised pretty successfully. At Hartsheath, five miles below Mold, the river becomes clear again; and from here down to Holt where it enters the Dee—a distance of about a dozen miles—good sport is to be had when the water is in the proper condition. The fishing is, I believe, for the whole of this distance perfectly free—at least I have never been interfered with, nor have I heard of any one who has. The fish in this fine stretch of water often attain a considerable size. I have known one to be taken of seven pounds! Such a fish as this is, however, one in a thousand—the average being from $\frac{1}{2}$ lb. to $\frac{3}{4}$ lb.; the largest I have myself taken was a fish of 2 $\frac{1}{2}$ lb. The river is very little fished by scientific anglers; but in the wasp-grub season, numbers of good fish are captured by the miners of the neighbourhood. The Alun is a comparatively sluggish river, and takes a good while to clear after a flood. During a very wet season—such as that of '79—it is in a state of almost perpetual flood; fly-fishing is then at a discount, and wasp-grub is almost the only bait the fish can be induced to take. This latter bait, indeed, appears to be a favourite one at all times and under all conditions of the water. It is during a hot, dry season, when angling on most other rivers is at a stand-still, that the Alun is in its prime condition for fly and minnow, and a skilful angler can then get excellent sport. The natural or artificial minnow at sunset—just for that short hour-and-a-half or two hours which intervene between sunset and dark—is then a most deadly bait among the larger fish. The angler in fishing the Alun should always use strong tackle as the river everywhere affords unusually good cover for the fish; and the largest trout are always found in places which afford the best strongholds. Chester and Wrexham are convenient localities for the head-quarters of the angler—the latter preferably. From Wrexham the Great Western will land him at Gresford, close to the river-side, in a few minutes, or if he prefer walking the distance is only a couple of miles. Dace are to be found in the Alyn below Rossett, and these will often afford the angler amusement when the trout are "off the feed." The Connah's Quay Railway will take the angler to Caergrill Station in ten minutes, which will land him on the river about two miles below Hartsheath—the highest point I would recommend him to fish, unless he be a bottom-fisher. To fish the higher waters—from Llanarmon to Rhydymwyn—the angler should take the London and North-Western Railway to the last named station, or hire a trap from Wrexham to Llanarmon; the distance will be about twelve miles. The Cedidog is a tributary of the Alun, which it joins at Cefn-y-bedd, three miles from Wrexham. There are some good trout in this stream. The best portion of the Cedidog is private, but the genuine angler will not be interfered with. Wrexham is within a reasonable distance of the Dee and Ceiriog. There is at present, however, a dispute as to the right of the public to the Mid Dee Fishery, pending which it would be as well for the angler to avoid this portion of the Dee. I will conclude by adding that the trout of the Alun *die game*; and for gastronomic purposes are inferior to none, which is saying a good deal.—E. GILES.

OTTERS IN THE THAMES.—On Monday, in last week, an otter, which weighed 13 lb., was trapped by Mr. May, of Sandford Mills, Reading, and was brought into the town alive. It was only on the previous evening that the local angling association offered a reward of £1 to any person killing an otter between Goring and Shiplake, or on the London or Kennet, within 10 miles of the main river, and Mr. May was the first to receive the reward.

Mrs. F. Y. BROCA'S Artificial Fly Dresser, 4, Mill-street, Conduit-street, Hanover-square, London, W. A stock of best flies always on hand. Flies made to pattern. Lessor in fly making given.—[ADVT.]

AN APPEAL FOR THE POOR THAMES FISHERMEN.

THERE have been few winters more hard and trying to the poor fishermen of the Thames than the present one, and I am referring to those who have no other employment than attending upon the gentleman anglers on our metropolitan river. For weeks and weeks they have had nothing to do and no means of earning money to purchase the common necessities of life; their homes have been denuded of every comfort, and warmth and food have been of the most niggardly and sparing character therein. It has been no fault of theirs; first the snow, then the frost, and successive periods of floods, have stripped them of every chance of employment. I could mention the names of men who are nearly on the point of the greatest want, who scarcely know one day after another where their daily food will come from—who have been hoping against hope that a change will come; and then as the prospects began to brighten, the stormy wind and tempestuous weather set in afresh, as though the elements were determined to rage and swell against them—there is no exaggeration in the descriptions, there is no drawing on imagination. The river-keepers will tell any one who will take the trouble to inquire. There are many homes in the greatest distress and many a honest fisherman destitute of common and necessary comforts. As I visit some of the fishing stations, the river-keepers assure me of the wants of poor fishermen; they point out to me some who are better situated than others—who have means of picking up a moderate living in other ways than fishing—but they add there are those, and men they can always reckon upon for help and assistance in the protection of the fishery, who are absolutely in want. I saw one of these the other day who came to one whose hand and heart is always ready to relieve suffering and distress; the poor fellow had done nothing for weeks and had been racked down in bodily health. His tale was a pitiable one, and ended if he did not pay his rent on the following Saturday, he would be turned out of house and home. He was relieved of this prospect at least, and when asked if he could do with a slice of beef, his reply eagerly accepted the chance with a declaration that for days he had never tasted flesh meat. I am speaking of a man who is one of the oldest of our Thames fishermen and who has spent more time in looking after the interests of the fishery than any other professional on the portion of the “City waters,” and certainly none more deserving of relief at the present time. This case is not an isolated one, for I could speak of another who is in the same state of suffering and want, and others too. I do not want, however, to paint the struggles of life in too high a colour. I want more to appeal to those whose circumstances will enable them to render some help—as a sovereign here and there bestowed would gladden many a miserable home. I do not want to mention names which are known to me, of suffering fishermen; the true hand of charity neither requires ostentation or display, for charity so exercised is to my mind the best of all. I will gladly be the almoner of any bounty and furnish particulars, if desired, of its bestowment. I know of, at least, three cases at the present time that are in extreme want, and if there is a desire to keep men honest—for poverty frequently tempts men to act against their feelings—let the rich and affluent amongst our Thames anglers meet as far as they can, the wants of these poor men. I should like to go to them in their homes; but without the means of relieving them there, my visit would do no good, as I know I should find relief was required of the most urgent character. The angling season will soon be over, the chances of employment are very poor, prospects dark, and the wretched weather adds to the discomforts of home. If anything can be done, it should be done at once; and even when a little employment comes there are old scores to be rubbed off, and the struggling bread-winner is heavily weighted with pecuniary liabilities that he has to remove. We,

who are living in the common comforts of home life, too unfrequently forget the poor outside—the poor who are made poor by the extremities of weather and the impossibility from such a cause of earning their daily bread. There are many, I am sure, when satisfactory cases are made out, would be ready to assist, and it is to these I would venture to make an appeal on behalf of the poor Thames fishermen. I have not spoken to our good friend, Mr. Thomas Spreckley, of 13, Cannon Street, on the subject, but I am certain if any amounts were entrusted to him, he and I would gladly visit the homes and dispense what is necessary to relieve the pressing wants of those who are most in need of it.

B.

A PERCH PARADISE.

ONE of the day-dreams of my youth was to be allowed to go perch-fishing in Lord Craven's stretch of the Kennet Canal, at Eubarne, above the “First Bridge,” the boundary westward of the Newbury Angling Club's water. I thought that, with any number of live silver-bellied minnows, ditto of well-scoured red worms from the local tan-yard heaps, fat gentles to vary the *menu*, and black-headed caddis by way of dessert, I should have been one of the most favoured and happiest of boys for one day at least! Gentle reader, you can have no possible idea of what this Perch Paradise was like. I have often walked up the towpath on sunny summer days, and seen the serried ranks of these handsome fellows, basking in the water conscious of safety under the ægis of my Lord's river-watchers, all looking as stolid as Turks and as numerous almost as “joey” mackerel is an estuary. 'Twas this that so whetted my piscatorial appetite and inspired my day-dream. I have thought since—how one does think of things in after years?—that if I had but sent in a humble petition to the then accomplished Dowager Countess of Craven who lived at Hampstead (Marshall) Park, that her ladyship might, perhaps, have kindly granted the desire of my heart, a day's perch-fishing in the said “Paradise,” unless setting up a precedent was objected to. In the lengthened days of May and June you might see the turtle doves flitting about the hawthorn trees, white all over with masses of “may,” or the restless lapwing over in the moor; or the lark up aloft singing his hymn of praise, while the little brown “wife”-bird was patiently performing the duties of incubation.

My day-dream was never realised. But some of the perch possibly getting tired of doing the “severely grand” in the Paradise above-bridge had either slipped out by the side door (the hatch) into the side brook, or had crossed the Rubicon by way of the lock, and got into the freer, but more dangerous Newbury waters. So there was some compensation—life is mostly made up of compensations—in the fact that if you could not angle in the Perch Paradise, you might catch perch that had come from the blest abode. The Right Hon. the Earl of Carnarvon allowed the Highclere Park waters to be netted last autumn for certain fish to be turned into the Kennet at Newbury, by way of experiment. And who knows, but that in the course of a few years, Lord Craven might not graciously permit the members of the local Angling Association to fish from the Canal Towpath only that passes through his lordship's property? Other landlords might likewise extend the privilege eastwards, perhaps, Mr. Burn Blyth, J.P., at Woolhampton; Mr. Higford Burr, J.P., at Aldermaston; Mr. Richard Benyon, J.P., of Englefield House, and perhaps, Mr. Blagrove, of Calcot Park. If so, there would be over twenty miles of the Canal Towpath Fishery to Reading, the trout fishery in part of the Lambarne, near Newbury, and the trout “tails” besides. “Preservation” is the order of the day. We preserve our small birds and our wild fowl and sea birds, &c.; we shall gradually preserve all our canals and rivers. It

cannot be done without co-operation, nor without money. Whatever is good for anything, is worth paying for; so it is with angling. When anglers, local and metropolitan know that there is a fair prospect of sport, they will be willing to buy tickets. There is another thing, the preservation of "coarse" and other fish will, in the words of Mr. Mundella, M.P., increase the supply of wholesome, and an agreeably varying food for those who capture the fish fairly with rod and line. Some people might look upon an incursion of anglers from London as detrimental to the quiet and good order of any locality. Let any such consider that in these days, especially, there are certain influences at work affecting society, that might receive a wholesome healing, and elicit or create a hearty appreciation for any graceful concessions on the part of noblemen and country gentlemen for the especial benefit of the industrious toilers and wealth-producing residents in town, in enhancing the opportunities for angling in waters where sport was pretty sure to be got. Town and country ought never to be divorced. Each will be all the better for joining hands. And in this Kennet Valley of ours and round about the good old town of Newbury, the lover of liberty must find a newer and stronger impulse when he reflects upon the battles fought upon yonder uplands and common, and also at historic Shaw, and at Donnington Castle.

Where GEOFFREY CHAUCER lived, and lov'd to roam,
And wrote quaint poetry amidst his sylvan home,
Then monks and friars of Orders white and gray,
Made most things pleasant, after their own way.
And in that desp'rate struggle 'twixt Royalty and Right
The brave Commander BOYS held the Castle day and night;
But the Rightful Cause prevail'd, as Right should ever do,
'Twas thus we won our liberties and mean to keep 'em too!

Royalist and Roundhead, with the City of London Train Bands, fought bravely here, when many noble deeds of daring and of heroic sacrifice were done on both sides that possibly found no enshrinement in the chronicles of the time. But English freedom and English liberties were all, the better and safer; and we have now rational liberty and more freedom! So be it ours—anglers, and all of whatever "colour" or creed—to guard, and protect, and defend if need be those rights and liberties, and our native land, from whatever quarter the dastard attempt might come. F.

NOTES FROM WESTMORELAND.

WE have now, it is to be hoped, seen the end of winter for this season at least. Without suffering from the severe hurricanes and snow storms experienced in other counties, the winter here has been more severe than usual. The frost did not last long, but then it was very severe. A great portion of Windermere was covered with ice strong enough to afford skating for hundreds of persons, who of course took every advantage of it. The other lakes, too, were more or less frozen over, and most of them bearable. The fish will not have had a good time of it, and so far no one can tell what kind of a fishing season we shall have in 1881, but we are all in hopes of a successful and a satisfactory one. I have not hitherto noticed disease amongst either trout or salmon, nor have I heard of more than half-a-dozen affected fish having been seen by others. Otters are plentiful in the Kent, and I take this as a sign that there are plenty of trout and salmon astir. I am sorry to say that the good intentions of the Board of Conservators for the Kent, Bela, Leven and Duddon Fishery District, have received a rather severe shock. It was thought there would be no difficulty in the way, and there would be nothing to prevent the Board, or some of its members, leasing the fisheries on Windermere, with the object of stopping the netting which goes on all the season. Of course the nets would be used once or twice, in order that their right would not be lost,

but the fisheries would have been strictly kept for rod and other legal modes of fishing other than by nets. However, it turns out, at the last moment almost, that there are at least two of the fisheries which could not be obtained, so the Board must of necessity hold over their good work until some other time. The nets off Windermere for a few years, and strict watching during the spawning times, would, I am sure, in a very short time, more than double the value of the fisheries. The trout in Windermere are quite equal to the best trout from even Loch Leven; they reach up to 6 lb. weight and even more. The char, as a dainty fish, is not to be surpassed; and there's water in Windermere which, properly cultivated, should yield a store of both trout and char almost invaluable, to say nothing of perch and pike. But proprietors evidently do not see the damage they do to their own property by allowing nets to be used, and of a mesh so small as to kill the babyest of fishes. But people are becoming a little more enlightened as to the value of pieces of water suitable for fish culture. We shall see great changes in a few years. Within the jurisdiction of the Kent, &c., Board, which includes a great portion of the Lake district, fishing, both for trout and salmon opens on Wednesday, March 2. There will be a few trout caught as soon as the season comes in, should the weather prove mild, but we have no clean salmon until towards the end of summer and in the autumn. From Windermere no doubt a great number of both trout and char will be taken with the nets during the first week. The Conservators have this year reduced the price of the salmon rod license (which includes trout) to ten shillings (last year they were fifteen shillings) for the whole district. Week and day licenses are issued at a reduced rate. Our local fishing tackle dealers just now are very busy, and Messrs. Hutchinson and Sons showed me the other day a lot of the best gut I ever saw, the lengths were so long and smooth and round and fine. Mr. Atkinson, the manufacturer of the quill minnow, has this year made a great improvement in this popular artificial bait. The colouring is better and almost transparent, and the gills by which the spinning is done are likewise improved, and so fixed and shaped that the bait will spin well in still water and when dragged down stream. Mr. Atkinson has likewise a lot of gut of especial quality. The weather is still very cold here, and the water does not look at all "fishy."

SPRINT.

ANOTHER ROYAL VISIT TO NORWICH.

THE FISHERIES EXHIBITION.

THE Mayor read a letter from E. Birkbeck, Esq., M.P., stating that H.R.H. the Prince of Wales had definitely decided to open the National Fisheries' Exhibition at Norwich on Easter Monday. Her Royal Highness the Princess of Wales would, Mr. Birkbeck was happy to say, accompany the Prince. Their Royal Highnesses the Duke of Edinburgh and Prince Leopold had also signified their intention of being present at the opening of the Exhibition, if their engagements would permit. Mr. Birkbeck felt sure that Norwich would give their Royal Highnesses a hearty and loyal reception on this occasion. (Applause.) The Mayor suggested that the Sheriff, the Deputy-Mayor, Mr. Gurney Buxton, Colonel Bignold, Mr. Birkbeck, Mr. Smith, and Mr. Field, be appointed a committee to co-operate with him in carrying out the necessary arrangements, a suggestion which was formally moved by Mr. Hill, and unanimously agreed to.

TO OUR ADVERTISING FRIENDS.

WE have much pleasure in drawing the attention of our advertising friends to the fact that the Committee of the National Fisheries Exhibition, at Norwich, will issue an official

catalogue and guide to the Exhibition, and that in this catalogue they will insert a limited number of suitable advertisements. It is hardly necessary for us to point out that this catalogue will be one of the best possible vehicles for conveying a permanent advertisement into the homes of thousands of anglers in all parts of the empire. The page is large and the price extremely moderate; and as example is better than precept, we will only add that we have at once secured a page for our own advertisement.

CORRESPONDENCE.

[We do not hold ourselves responsible for opinions expressed by our Correspondents.]

ANSWERS TO CORRESPONDENTS.

J. F.—Not received. We do not wish to re-open the question.

GENTLEMEN POACHERS.

SIR,—On the 19th inst., at 4 p.m., I was angling in the Wensum, at Thorpe, when, to my astonishment, a boat with three occupants came directly opposite me and deliberately fished with a cast net. Will you or some reader kindly inform me if this was legal? I may state on my own part their fishing was not fair, as they threw the net into my swim, taking some fine perch. Query: Were they again returned to the water, as they were very careful I should not witness the act? I should also like to know if netting has recently become a gentleman's privilege?—I am, &c.,
Norwich. FAIRPLAY.

TROUT FLIES.

SIR,—After a special experience of 25 years' fly-fishing, I fully endorse your comments on Mr. Pennell's and "Blue Dun's" theories respecting the desirability of having a good stock of various kinds of flies. In my shilling book on Trout-Fishing, just published, I have 130 different flies, and it was with me, at the time of writing, a moot question as to whether the list could not be further extended.—I am, &c.,
Caistor, Lincolnshire. THOMAS FORD.

THE RAIL AND THE ROD.

SIR,—If your correspondent "R. T. R.," in your paper of 19th inst., will forward 2s. in postage stamps to G. W. H., Rumsam Cottage, Barnstaple, he can have a copy of the work he requires, viz., "The Rail and the Rod," South-Western Railway.—I am, &c.,
G. W. H.

THE RAIL AND ROD.

SIR,—Would you kindly inform "R. T. R." that I have the book he seeks, "The Rail and the Rod," by Greville F., which I shall be pleased to let him have.—I am, &c.,
P. F. DAVIS.

FISHING QUARTERS IN DERBYSHIRE.

SIR,—In answer to the letter of your correspondent signing himself "A Member," I admit that I was in error when I said that the water at Millersdale might be fished by paying 1s. 6d. for a day ticket; I forgot, when writing the piece, that the Wye there was preserved by a club. I believe, however, however, that tickets for part of the stream can be obtained at the Angler's Rest, an inn close by the river side.—I am, &c.,
February 19, 1881. BLUE DUN.

"FOSTER" FUND.

SIR,—I have much pleasure in acknowledging receipt of one sovereign towards the above fund from our old friend, Mr. P. Geen, accompanied by the enclosed letter. As usual, he is one of the foremost to assist distress. I sincerely hope that the thousands of anglers who are now enjoying the fruits of the Association's labours will also give a trifle towards the widow and children of one of our most assiduous workers of the past.

I have forwarded a circular and subscription list to every society in London, and also to tackle dealers, &c. Some will arrive rather late in consequence of my being compelled, through indisposition, to lay down my pen and take to my bed instead.

The list will remain open until the 29th March, instead of the 9th, as announced.

I shall be glad to send, upon application, a subscription list to any one applying for same.—I am, &c.,
T. HOOLE.

DEAR HOOLE,—I was much pained to hear of our friend Foster's death. He was one of the few humble and steadfast workers on behalf of his brother anglers, of whom it may be truly said that an unkind word was never spoken by him or against him. I am pleased that the Committee should think this a special case, calling for something more than a grant from the "Benevolent Soc." There are many who will feel the truest of all pleasures in assisting the widow and family of such a man.

You may rely on my doing something amongst my friends. Kindly put me down for one sovereign, for which I enclose P.O.O.—Yours truly,
Hill View, Addlestone, Surrey, February 21, 1881. P. GEEN.

MR. GEEN AND THE THAMES RIGHTS' DEFENCE ASSOCIATION.

SIR,—Mr. Geen in his letter to you deprecates the Thames Conservancy being told the truth. Mr. Geen's position with regard to the Thames Conservancy appears to be like that of the apologists of Charles the First, as described by Macaulay. The "Martyr King" had broken the laws he had sworn to defend; he had treacherously committed the worst of crimes; yet, his

apologists answered, he was kind and gentle to his children. In the same way the Thames Conservancy has allowed the public rights on the Upper Thames to be claimed without asking the nature of the claims upon the river this body was formed to "conserve"; and it is known that some members of that body are the very persons who have made these claims, substantiating them, too, by an illegal and ignoble misuse of another power they possess—that of county justices. Yet, forsooth, when the Thames Rights' Defence Committee set forth the plain facts in unvarnished language, Mr. Geen says: "I agree with every word you say; but pray don't say it. It is true Thames Conservators are endeavouring to rob the angling public of the Upper Thames, and the Thames Conservancy does not put out a finger to do its duty to the public; but they have given us privileges on the Lower Thames, so pray don't tell them the truth. True it is that Conservators, without a shadow of right, have summoned brother piscators before brother 'justices' (God save the mark!), but the Conservancy must not be offended, but 'properly approached,' for the Conservancy has answered the appeals of the T. A. P. S."

Really, sir, I feel the deepest respect for Mr. Geen in regard to his talents and piscatorial attachments, but his illogical conclusions as to the action to be taken must be repudiated. He is a clog to real action, and his sympathy for the Thames Conservancy for its action in regard to the bit of water below Staines, will go far to assist the robbery from the growing body of anglers of the far more important waters of the Upper Thames. It is time that Mr. Geen looked the whole matter fairly in the face; and if he cannot subscribe to the necessary action of the Thames Rights' Defence Association, he should, at least, leave them free from his clogging sympathies for a body which has permitted the difficulties to arise.—I am, &c.,
135, Loughborough Road, S.W., Feb. 23, 1881. JOHN WHILE.

"IDENTIFICATION OF RARE FISHES."

SIR,—My attention has been drawn to the above, by a letter in last week's FISHING GAZETTE, from Charles C. Capel, wherein he states that he shall always be pleased to do anything to assist and advise those who may please to apply to him as to the identification of rare fishes, general information, &c. But, as he justly remarks, it is perfectly impossible to hope to do all for the public that Mr. Buckland did. We can only try to do our utmost, that is all. This letter is to the purport in every form and goodfellowship; and as your correspondent is so very many miles from here (Exeter), I have no doubt that if I offer to do the same for this part of the country, viz., Devon, Cornwall, &c., he will consider that his letter will yet be the means, of those who have studied under our late lamented friend Mr. F. Buckland, being able to diffuse that knowledge he so laboriously sought for, and so heartily tendered to them. During the past few years, out of the sixteen of our friendship, I have been able to submit to his notice the following rare and curious fish, many of which are to be seen in this Museum, South Kensington, and the Albert Memorial Museum, Exeter:—

Dusky perch—*Serranus gigas*.
Blue shark—*Squalus glaucus*.
Eagle ray—*Myliobatus aquilla*.
Redband fish—*Cepola rubescens*.
Probeagle shark—*Squalus cornubicus*.
Monk fish—*Squalus squatina*.
Spinous shark—*Squalus spinosus*.
Stone bass—*Polyprion cernium*.
Sapharine gurnard—*Trigla lyra*.
Silvery hairtails—*Trichiurus lepturus*.
Large sturgeon—*Acipenser sturio*.
Dorey, 11 lb.—*Zeus faber*.
Boar fish—*Zeus asper*.
Yellow goby—*Gobius auratus*.
Yellow skulpin—*Callionymus lyra*.

Dusky skulpin—*Callionymus dracunculus*.
Angler fish—*Lophius piscatorius*.
Ballan wrasse—*Labrus tinca*.
Three-bearded rockling—*Motella vulgaris*.
Anchovies—*Culpea encrasicolus*.
Five-bearded rockling—*Motella mustelo*.
Bloch's topnot—*Rhombus punctatus*.
Sand sole—*Solex pegusa*.
Scaldfish—*Rhombus arnogglossus*.
Twaite shad—*Clupea abasa*.
Great pipefish—*Syngnathus acus*.
Butterfish—*Blennius gunnellus*.

And the following rare crustaceæ:—Two broad-tailed lobsters, one squat lobster, an "Angled crab," "Hairy porcelain crab," "Minute crab," "Montague's crab," "Velvet fiddler crab," and "Spider crabs," with numerous others.

Thus showing that many rare specimens have been taken round our immediate coast, and doubtless many rare specimens are lost for want of persons willing to diagnose them near where they are taken. Therefore, if not intruding too much upon your valuable space, I beg to say that I will do my utmost; and, as your correspondent, C. C. Capel states, in order to facilitate the early receipt of specimens, all parcels should be sent, carriage paid, to
14, Portland Street, Exeter.

FRANK GOSDEN.

CLUB REPORTS.

AMICABLE BROTHERS' ANGLING SOCIETY.

Messrs. F. Harding and Squire had a nice show of roach from the River Lea, on Wednesday last. Sunday, Feb. 20th, Messrs. A. Medcalf and Say weighed in one jack each. Messrs. Moir and F. Plumstead had some very fine roach from the river Lea. Total weight, 11 lb.—J. WORLEDGE.
Feb. 22nd, 1881.

BATTERSEA PISCATORIAL SOCIETY.

The above club proceeded to Hampton on Sunday last, for the purpose of competing for a prize presented by Sir Trevor Lawrence, Bart., M.P., and for two others given by Messrs. Willoughby and R. A. Banfield, but it unfortunately turned out to be an impossibility, the water covering the banks. It was therefore decided to adjourn the competition until the last Sunday of the season. There will, however, be two prizes for competition on Sunday next, the donors being Messrs. Ash and Knox.—C. NEWMAN, hon. sec.

BATTERSEA FRIENDLY ANGLING CLUB.

The members of this club were busy on Sunday last, Mr. Milsted weighing 8 lb. of dace, from Twickenham, Mr. A. Ansty 5 lb. 1 oz., from same place, Mr. W. Excell jack, from Wraybury. We shall receive a visit from the angling clubs No. 3 district on Tuesday next, March 1, and shall be glad to see our brother anglers show up in force. Our annual supper takes place on Tuesday, March 15, at the club-house, Mr. Pettett's, Queen's Hotel, Queen's Road, Battersea Park.

BERMONDSEY BROTHERS ANGLING CLUB.

I beg to inform you there was a good show of roach and perch at the Bermondsey Brothers Angling Club on Sunday last, considering the flooded state of the waters, mostly from Pangbourne, Mr. Alfred Frost showing about 8 lb. of roach and perch; one perch weighing 3 lb.—W. ALLEN, sec.

BOSTONIAN ANGLING SOCIETY.

Several of our members were out on the 20th inst., Mr. Collier weighing-in 5 lb. 5 oz. roach, Mr. Hart also weighed-in roach. Two of our members Mr. Harris, and Mr. Jennings have arranged a friendly match to take place at Windsor, 1st Sunday in March, £5 a side, roach only to weigh.—H. TAYLOR.

BRISTOL GOLDEN CARP ANGLING ASSOCIATION.

On Monday last two of our members were out near Keynsham, viz., Mr. Withers and Mr. Clements. The former caught some very nice roach and a nice carp (the carp being hooked foul). He was fishing an eddy when he saw his float go bobbing up and down, and concluded he had got foul, and commenced winding and pulling, when all of a sudden there came a rush, and away went his line down stream about 40 yards, and after playing the fish about five minutes, succeeded in getting it into the net and landing it. To his surprise it was a carp of about 4 lb. weight (being hooked in the back fin). Mr. Clement caught a very nice pike, weighing about 9½ lb. We are glad to say that our friend, Mr. Chas. Morgan, has recovered from his severe cold, and has promised to give us "The Sunday at Highbridge" on Monday next.—L. WRIDE, hon. sec.

THE CAMBRIDGE FRIENDLY ANGLING SOCIETY.

The return visit to the above Society took place on Thursday last, the 17th inst, the chair was ably taken by Mr. Dixie (Golden Barbel), supported by Mr. Adeare (Westbourne Park), in the vice-chair. The following gentlemen contributed some capital songs, viz., Messrs. Dixie, Adeane, Star, Dawes, A. Warsop, Gadswood, Chambers, H. Porter, Dobell, Wilson, Staurt, Sutton, Prosser, &c. On the roll being called at 11 o'clock the following societies were represented:—Bostonians, Duke of Norfolk, Golden Barbel, Hammer-smith United, Hampstead, Marylebone, Norfolk, North Western, Prince of Wales, Waltonians, and Westbourne Park; also Alliance and Cavendish not in district. Mr. Bonvoison, on behalf of the visiting societies, proposed success to the "Cambridge Friendly," which was responded to by Mr. Osmon. Altogether a very enjoyable evening was brought to a conclusion about 12 o'clock. During the evening Messrs. Warsop and Carwell brought up a very nice take of roach and rudd, which were much admired.—W. SUTTON, sec.

Feb. 21, 1881.

CITY OF LONDON ANGLING SOCIETY.

Several of our members visited Amberly on the 20th, only one of them being successful. Mr. Chambers, jun., weighing-in bream and roach, Mr. Castell also weighing some roach from the Roding.—CAS.

EAST ANGLIAN PISCATORIAL SOCIETY.

The usual monthly meeting was held at the club-house, Great Eastern Wine Vaults, on Tuesday, February 22nd, W. G. Capon in the chair, and Bailee Fowler occupying the vice. There was a good attendance of members, and it was resolved that an angling match take place early in the spring, for which several prizes are already offered. After the ordinary business was disposed of the remainder of the evening was spent in conviviality. Messrs. G. Webb, W. G. Capon, G. Corbyn, and Fowler adding greatly to the harmony. Bailee Fowler having given a recitation from Mark Twain, Mr. Corbyn sang with great taste "The Anchor's Weighed," and the meeting then terminated, having had a most successful gathering. Mr. E. Roberts was elected a member and several others were proposed.—ANGLER.

EDMONTON AND TOTTENHAM ANGLING SOCIETY.

The water having fined down the latter end of last week many of our members were out. Among those who stopped near home and fared best were:—Mr. J. Collyer, with 3 fine jack, weighing 8 lb., 7 lb. and 3 lb.; Mr. R. Money, 1 jack, 7 lb.; Mr. G. Stevens, roach and dace; and Young Dug, 1 jack, 2½ lb. On Wednesday, Mr. B. Lowin had 4 jack weighing about 10 lb., and Mr. A. Robinson, 2 jack, weighing 6 lb. We fish on Sunday next, Feb. 27th, for two special prizes, given by Messrs. Biscoe, of Fetter Lane, and Burrows, of Edmonton. As this will be the last Sunday for jack-fishing this season no doubt a large number of members will be out, and should the weather be at all favourable a good show may be expected.—D. G. M., sec.

GOLDEN TENCH ANGLING CLUB.

On Sunday evening last there was the following show at the above club, it being one of the handsomest for some time:—Messrs. Byden, Flowers, and Webb, the two latter fishing the Lea, Mr. Byden and Mr. Higley fishing the Grand Junction Canal, the take was as follows:—Mr. Byden, 2 jack, 8 lb. 10 oz.; Mr. Flower, roach, 5 lb.; Mr. Webb, roach, 20 lb., 1 jack, 2 lb. 5 oz.—his roach numbered 31 fish. Messrs. Higley, Brown, Sanston, and Gordon came home blank, not for the want of trying, but the wind was dead against fishing the Lea.—T. S. WEBB.

Feb. 22, 1880.

HAMMERSMITH UNITED.

On the 17th inst. our hon. sec., Mr. Penney, succeeded in landing a pike weighing 9 lb. 7 oz., from some private water near London. Messrs. Aldridge and Walters also had a good show of roach and perch from the Colne. Messrs. Edon and Penney were again among the jack on the 20th, taking three nice fish. We shall be glad to see a larger attendance of members on Thursday evenings. I beg to thank Mr. Brougham for his very satisfactory letter anent the dace at Teddington.—VORTEX.

THE LARKHALL ANGLING SOCIETY.

I am very sorry to see such a lot of rain, as I think it will spoil the fishing for this season, not one of the members has been out, as it is no good fishing while this weather lasts. The Ten Guinea Challenge Cup, given as a prize subscribed to by numerous members of the above society, looks like being taken by Mr. G. Penn, as he has the heaviest weight as yet, and I think he stands a very good chance of winning it for this year. The annual dinner is arranged to take place in March at Moufflet's Hotel, when I have no doubt there will be a very large muster. I hear that several gentlemen, who were proposed as members, were elected last Wednesday, but not

without one or two black balls being put into the ballot-box, the reason for which I cannot conceive, but, however, they were elected amid great applause, two of which have already given a prize of one guinea. Next Wednesday is the monthly musical evening of the society, when I believe there will be some first-class talent present, and I have no doubt a very pleasant evening will be spent, each member has the privilege to introduce one friend. This society seems to be weekly increasing in numbers; in fact, I heard it whispered that our most worthy host intends enlarging the club room. We have another addition to the cases of stuffed fish, which is a splendid barbel of over 6 lb. in weight, preserved by Mr. G. Watkins, of Clapham, and it really is a fine fish. There is also a fine chub, which is being preserved, and will, no doubt, look very handsome in the case by the side of the other numerous collection of fish.—H. W.

Feb. 22.

THE LITTLE INDEPENDENT ANGLING SOCIETY.

On Sunday a few of our people tried their luck, and succeeded in getting a very pretty show. Mr. Humphreys, 9 lb. 1 oz. roach, 6½ oz. roach; Mr. Scott, 1 lb. 7 oz. jack, 14½ oz. roach; Mr. Hurwood, 1 lb. 5 oz. (one fish) roach; and Petrie and Wightman, dace. To-day our old friend Peter Banfield tried his luck at Dagenham, and brought in a beautiful jack scaling 5 lb. 8 oz. I might as well repeat to you that our return district visit takes place on Tuesday next, the 22nd inst.—WM. BROWN, hon. sec.

Feb. 17, 1881.

We had a very pretty show of fish on Sunday evening, particulars as under:—Mr. Scott, 7 lb. jack (one scaling 5 lb. 9 oz.), 10 oz. roach, 8 oz.; Mr. Humphreys, 1 lb. 2 oz. jack; Mr. Hopton, 15 oz. roach; Mr. Mead, 14 oz. roach; Mr. Hurwood, 13 oz. roach, 8 oz. perch and gudgeon; Mr. Watts, roach, dace and gudgeon. Mr. Castle, one of our members, presents a silver cup to our society to be contested for on the last Sunday of this season, for heaviest weight of roach—no private waters. Our return local visit at our clubhouse on Tuesday night was a complete success, the house was literally crowded, twenty-two clubs answering to calls. Our chairman, Mr. Pipe, presided, faced by Mr. E. Barr: pianist, Mr. S. Gordon. The harmony was well sustained by the following:—Messrs. Hopling and Williams, Hearts of Oak; Mr. Beaumont, Woolwich Brothers; Mr. Phillips, Great Northern Brothers; Messrs. Newman and Sutton, Jolly Piscatorials; Mr. Wilton, Alliance; Mr. Jennings, Bostonians; Messrs. Hart and Kitmar, St. Pancras Working Men's, were highly applauded in their duets of "Larboard Watch" and "All's Well." Everything passed off to the entire satisfaction of all, and the last song, "The Flying Dutchman," sung by Mr. Letch, met with a most enthusiastic reception. The next visit goes to the Sir Hugh Myddleton.—W. BROWN, hon sec.

Feb. 23.

NORTH-WESTERN ANGLING CLUB.

Messrs. Hillier and Bonvoison were fortunate in having a show of roach on the 20th. The members fish on the 27th at the Rye House for a series of prizes. Prizes for the half-year ending March 14th, 1881:—Jack prizes.—Mr. Warner, heaviest, Welsh Harp, season ticket; Mr. Plumpton, heaviest, Welsh Harp, S. 7 lb., shade of fruit; Mr. Plumpton, jun., heaviest, Welsh Harp, S. 6 lb., value 10s. 6d.; Mr. Thorne, heaviest, Welsh Harp, 6 lb., 10s. 6d.; Mr. Harding, heaviest, Welsh Harp, 5 lb., 10s. 6d.; Mr. W. Roxbee, heaviest, spinning, Welsh Harp bank, 4 lb., 10s. 6d.; Mr. Shackel, heaviest, Welsh Harp, 6 lb., 10s. 6d.; Mr. J. Packman, jun., heaviest spinning, 3 lb., 10s. 6d.; Mr. Clark, heaviest, 5 lb., 10s. 6d.; Mr. H. Wynn, heaviest, Welsh Harp, 7 lb., 10s. 6d.; Mr. Smart, heaviest, S. 5 lb., 10s. 6d.; Mr. Cox, heaviest weight, S. Welsh Harp, 10s. 6d.; Mr. L. Roxbee, heaviest weight, Welsh Harp Bank, 6 lb., 10s. 6d.; Mr. Hatch, heaviest, Elstree, 5 lb., 10s. 6d.; Mr. Lawrence, heaviest, Thames, 3 lb., 10s. 6d.; Mr. W. H. Tidy, heaviest weight, Elstree, 10s. 6d.; Mr. Aldis, heaviest, Welsh Harp, 7 lb., 10s. 6d.; Mr. Newman, heaviest weight, Elstree, 10s. 6d.; Club Prize, heaviest, 8 lb., 10s. 6d.; Club Prize, heaviest weight 30 lb., £1 1s. Roach:—Club Prize, heaviest weight 30 lb., £1 1s.; Club Prize, heaviest weight 1 lb. 8 oz., 10s. 6d.; Mr. Holmes, heaviest, Thames, 1 lb. 4 oz., £1 1s.; Mr. J. H. Stead, heaviest weight 15 lb., punt rod; Mr. Creed, heaviest weight 6 lb., L. and N. W. R., S., 10s. 6d.; Mr. Harding, heaviest weight, Bank, S. 15 lb., easy chair; Messrs. Hillman and Harriot, heaviest weight 20 lb., picture; Mr. Marshall, heaviest weight, bank, 10 lb., S., 10s. 6d.; Mr. Mayman, heaviest weight, 10s. 6d.; Mr. Abrahams, heaviest, 1 lb 8 oz., bank, 10s. 6d.; Mr. J. Reynolds, heaviest weight, bank, 10 lb., 10s. 6d.; Mr. Bonvoison, heaviest weight, bank, S., 15 lb., 10s. 6d. All Fish:—Club Prize, 40 lb., £1 1s.; Mr. Kelsey, heaviest weight, pair of fishing boots; Mr. C. Pearce, heaviest weight, Elstree, £1 1s.; Mr. Gooch, heaviest weight, December 12th and December 19th, piece of beef; Mr. Revill, heaviest weight, Welsh Harp, roach rod; Mr. Austenbury, heaviest weight 20 lb., cup; Mr. W. J. Wetenhall, heaviest weight, £1 1s.; Mr. Gooch, heaviest weight, £1 10s.; Mr. Morth, heaviest weight, 10 lb., 10s. 6d.; Mr. Forman, heaviest weight 10 lb., S., 10s. 6d. Perch:—Club, heaviest weight 15 lb., 10s. 6d.; Club, heaviest weight 2 lb., 10s. 6d.; Mr. Lancaster, jun., heaviest weight, Lea, 6 lb., 10s. 6d.; Mr. Lancaster, sen., heaviest weight, Lea, 6 lb., 10s. 6d.; Mr. Mayman, heaviest weight, 10s. 6d. Dace:—Club Prize, heaviest weight 10 lb., 10s. 6d.; Club Prize, heaviest weight 8 oz., 10s. 6d.; Mr. Sambell, heaviest weight, bank, 3 lb., 10s. 6d.; Mr. Vincent, heaviest weight 4 lb., picture. Bream:—Club Prize, heaviest weight 20 lb., 10s. 6d.; Club Prize, heaviest weight 4 lb., 10s. 6d. Chub:—Club Prize heaviest 3 lb., 10s. 6d.; Mr. Hillier, heaviest weight 5 lb., value 10s. 6d.; Mr. Gainsford, heaviest weight 10 lb., 10s. 6d. Barbel:—Club Prize, heaviest weight 15 lb., 10s. 6d.; Club Prize, heaviest weight 4 lb., 10s. 6d. Club Prize, heaviest carp 3 lb., 10s. 6d.; Club Prize, heaviest trout 1 lb., 10s. 6d.; Club Prize, heaviest rudd 1 lb., 10s. 6d.; Club Prize, heaviest grayling 8 oz., 10s. 6d.; Club Prize, heaviest tench 3 lb., 10s. 6d. Excursion to Rye House, February 27, 1881:—Mr. Ames, 1st prize, book; Mr. Brown, 2nd prize, book; Mr. Clark, 3rd prize, 10s. 6d.; Mr. Packman, 4th prize, 10s. 6d.; Mr. Wynn, 5th prize, 10s. 6d.; Mr. Bell, 6th prize, 10s. 6d. Excursion to Pangbourne, March 13, 1881:—Mr. Halse, 1st prize, fancy table; Mr. George, 2nd prize, box of cigars; Mr. Underwood, 3rd prize, 10s. 6d.; Mr. Turner, 4th prize, 10s. 6d.; Mr. Pawley, 5th prize, 10s. 6d.

ROYAL GEORGE ANGLING SOCIETY.

On the 20th inst. Messrs. Holden, Palmer, Chart and Trotter had roach and dace from the Thames. A match has been made for Messrs. Trotter and Guyman to row Messrs. Jones and Palmer during the fence months, which will no doubt act as an incentive in keeping the members together during that monotonous period.—F. MILLARD, sec.

ROYAL PISCATORIALS.

Mr. T. Hughes ventured out this week alone. In spite of floods or snow, on Wednesday he succeeded in capturing eight jack, three weighing about 3 lb. each, four about 5 lb. each, and one 17 lb. These fish I saw at the headquarters of the society on Thursday night. Information had been received that night that he had that day succeeded in catching eight fish weighing 70 lb., and that they would be at the society's house on Friday night. Now is the time to pay a visit to the "Royals," and see some large jack that will make you open your eyes, all ye jack-fishers that have not seen a fish since Christmas. Come next Saturday or Sunday night, and see them and—PIXIE.

Feb. 24, 1881.

THE STOKE NEWINGTON ANGLING SOCIETY.

Shows of fish with us, have of late been so very moderate, that I have not troubled to send you any report. Messrs. North, Parrott, Webb, and other members constantly persevering only to meet with disappointment. However, its a long lane, &c., and Mr. E. North has at last broken the spell of bad luck. This gentleman showing up on the 20th inst. with 8 lb. 13½ oz. roach taken from the river Lea, and a very pretty lot of fish they were, the four largest scaling 3 lb. 1 oz. Should the weather prove at all favourable before close time I hope to send you further good accounts of this, and other members of the above society.—T. GRETTON, secretary.

Feb. 22nd, 1880.

SURREY PISCATORIALS.

To-day (Thursday), Feb. 24th, Mr. Pugh visited Twickenham and succeeded in getting 13 lb. of dace and roach, 11 lb. 13½ oz. being weighable in this society. This being a business night, it was proposed by Mr. Beckett, "That, at the next competition (March 10th), all members fish where and how they like." A general meeting will be called on March 17th for the purpose of electing officers for the next season, and all rules to be revised. The revising committee are as follows:—Messrs. Medway, Boalch, Duck, Whitby, Haywood, Beckett, and Pugh. The result of their labours will be placed before the members at the aforesaid general meeting.—PIXIE.

Feb. 24, 1881.

WALTONIANS.

On the 16th, Mr. Rushbrook had roach from Pangbourne. On the 20th the following gentlemen weighed in fish:—Messrs. Roland, Brand, and Good, jun.—A. J. MARRIOTT, reporter.

Feb. 22nd, 1880.

THE WALTON AND COTTON ANGLING ASSOCIATION.

THE annual dinner of the above old-established club was held at the society's rooms, the Crown and Woolpack, St. John's-street Road, on Wednesday evening the 16th inst., when a large gathering of members and friends assembled to take part in the pleasures of the meeting, and to witness the distribution of the prizes. The dinner, as usual, was of the most *recherché* character, and gave general satisfaction. After the usual loyal and patriotic toasts the Chairman, in proposing continued success to the "Walton and Cotton Angling Association" referred to the manner in which the society was conducted and the success it had attained through the indefatigable exertions of its secretary, Mr. H. Harding, who had managed to keep the full complement of its members so steadily together.

The Secretary, in returning thanks, read his report and presented a very favourable financial one, prepared by the auditors of the association.

The distribution of the prizes for the season ending 31st December, 1880, was then proceeded with, Mr. John Jones taking the treasurer's prize of £1 is. for the gross weight of three largest fish (weight 30 lb. 8 oz.), and also an association prize of £1 is. for a pike of 10 lb. and upwards, Mr. Jones's take for the season was made up as follows, viz., jack, 192 lb.; roach, 1 lb. 10 oz.; barbel, 7 lb. 4 oz.; chub, 34 lb. 7 oz.; trout, 2 lb. 12½ oz.; bream, 5 lb. 11 oz.; perch, 3 lb. 4 oz.; dace, 2 lb. 1 oz.; grayling, 8½ oz.; total, 249 lb. 10 oz.

Mr. Starkey took our association prize of £1 is. for a trout over 2 lb. taken with fly, ditto for a chub of 4 lb. and upwards. Mr. Starkey's takes for the season were as follows, viz., jack, 281 lb. 11½ oz.; roach, 2 lb. 2½ oz.; barbel, 3 lb. 14 oz.; chub, 7 lb. 5 oz.; trout, 9 lb. 2½ oz.;

bream, 41 lb. 2 oz.; perch, 1 lb. 14½ oz.; dace, 15 oz.; eels, 10 lb. 5 oz.; total, 358 lb. 8 oz.

The members prizes as enumerated were nearly all taken, viz.:—Members' Prizes: (1) Given by Mr. Jones, half-guinea for the largest carp over 5 lb. (2) Mr. Potter, one guinea for the largest number of fish over 4 lb. each, of any species. From any water. (3) Mr. Potter, half-guinea for the total weight of barbel. (4) Mr. Potter, half-guinea for the total weight of jack. (5) Mr. Potter, half-guinea for the total weight of chub. (6) Mr. Potter, umbrella for the total weight of fish. (7) Mr. Grimmo, one guinea for the largest trout. (8) Mr. Crowley, one guinea for greatest weight of jack taken, and shown first Wednesday in November. (9) Mr. Goodfellow, tankard for fourth heaviest weight. (10) Mr. John Bull, a present for the greatest weight of tench. (11) Mr. Collingridge, jewellery to the value of one guinea for third heaviest weight. (12) Mr. W. F. Bull, a present for a tench 2 lb. and over. (13) Mr. Simpson, half-guinea for the largest weight of roach to the member who has not taken more than two prizes from the presentation list. (14) Mr. Bruton, half-guinea for the largest tench. (15) Mr. Bruton, half-guinea for the largest perch (not taking society's prize). (16) Mr. Starkey, half-guinea for the total weight of roach. (17) Mr. Starkey, half-guinea for the total weight of perch. (18) Mr. Starkey, half-guinea for the total weight of dace. (19) Mr. Starkey, half-guinea for the total weight of jack. (20) Mr. Hawkins, half-guinea for the second largest roach. (21) Mr. Rogers, half-guinea for the largest dace. (22) Mr. Rogers, jack winch for the largest jack. (23) Mr. J. Pratt, half-guinea for the largest roach taken in June from the Lea free water. Not to be taken by any member who has taken four prizes. (24) Mr. Crowley, jun., half-guinea for a chub 5 lb. and over. (25) Mr. E. Bradsell, half-guinea for the greatest number of shows during the season. (26) Mr. Stocker, half-guinea for the second largest jack. (27) Mr. Stocker, half-guinea for the second largest barbel. (28) Mr. W. J. Thomas, half-guinea for the greatest weight of any fish on 13th September. (29) Mr. G. F. Thomas, half-guinea for second largest take of roach. (30) Mr. Tacchi, a prize for the best average weight, not less than eight shows, a framed engraving, value not less than one guinea. (31) Mr. S. Renaut, one guinea for the greatest weight 1st Wednesday in September. (32) Mr. Morgan, half-guinea for the second heaviest weight of bream taken in one day. (33) Mr. Pawley, half-guinea for the total weight of eels. (34) Mr. Pawley, half-guinea for the greatest weight of roach over 1 lb. (35) Mr. Caplin, half-guinea for the greatest weight of bream in one day. (36) Mr. Barnes, a present for the greatest weight of jack any three days in the season. (37) Mr. Javens, half-guinea for trout over 4 lb.; failing, grayling to take this prize. (38) Mr. Gravatt, half-guinea for the second largest trout. (39) Mr. Josephs, sen., half-guinea for the greatest weight of dace. (40) Mr. J. F. Ake man gives a guinea for the largest roach. Day out, September 22nd, Wednesday. (41) Mr. E. Bradsell gives a prize value of two guineas for the greatest weight of any kind. (42) Mr. Harding, a present, value one guinea, for the second greatest weight of any kind of fish. (43) Mr. Anderson, one guinea for largest take of roach. (44) Mr. Callard, one guinea for the largest jack. Not less than six members to compete on this date. The total weight of fish weighed-in during the season amounted to 1800 lb., being nearly 200 lb. in excess of the previous year. The business of the evening having been disposed of, some excellent singing followed, bringing to a termination a most enjoyable gathering of old and young members of "Walton and Cotton" Anglers.—A. H. CLARIS, Reporter.

GEORGE JAMES EATON, of Starkholmes Matlock-Bath, Derby hire, respectfully invites Noblemen and Gentlemen to try his standard FLIES for the present season. No flies sent or made up but what he himself has proved sure killers. A trial is all that is required from gentlemen who can fish to prove whether they may be genuine or not. Patronised by some of the best fishermen of the day. All flies dressed on the best Kendal books. Prices: Point Flies, 2s. 6d. per Dozen; Dropper Flies, 2s. per Dozen. Orders punctually attended to.—[ADVT.]

TO ANGLERS.—W. J. Cummins, Fishing Tackle Maker, Bishop Auckland, is now prepared to forward to anglers his Illustrated Catalogue, which is not only a Trade List but is interspersed with practical hints, useful directions, and valuable information gathered by the river-side from twenty years' experience. The stock consists of his unrivalled Salmon, Trout, Grayling, and Pike Rods, Lines, Reels, Baskets, Artificial Baits, Fly-books, Landing Nets, Gaffs, and last, but not least, his celebrated Trout Flies, which for killing powers stand unequalled. Every article kept in stock is of the very best description.—[ADVT.]

SATURDAY, MARCH 5, 1881.

AN ANGLER'S STORY.

A YEAR or two ago (the exact date does not make an iota of difference to what I am about to tell you) I had occasion to make a somewhat long journey by rail. It was during coldest spring weather in a backward season, when the thrushes should

have been singing their "love songs on the tree-tops," and the hedges, as a matter of right, ought to have been breaking out into bloom; the lark, too, one could see, in imagination only, rising and twittering his earnest carol, guileless of harm, while the bird-catcher in the field adjoining was doing his best to catch that "aerial songster," as the poets call him. I was comfortably seated in a cosy corner of a first-class carriage, and amid a cloud of smoke, was meditating upon things in general—piscatorial ones more particularly; for be it known my journey was taking place upon a day when I should have fished one of the best portions of a magnificent trout stream, where all fish caught under 4 oz. in weight are to be returned alive to the stream, and where the general average is about five fish to 2 lb., and often enough 20 lb. of such trout are caught with fly in one day. And such an opportunity as I had missed does not occur once in a life-time, I was going to write, but, at any rate, with truth, I may say once in a season. My meditations are somewhat abruptly closed by the shrill whistle of the engine, a slackening of our pace, and an ultimate stoppage at a principal station on the main line from town to the north. "You have ten minutes here, sir," said the guard, as he opened the carriage door; and, being somewhat athirst, I alighted and made acquaintance with the whisky cold in the refreshment room. On returning to my carriage, I found one seat occupied by a rather odd-looking individual. He wore a large grey coloured "billy-cock" hat, slouched down over his ears; he was a little man, with dark mild eyes; his dress was somewhat negligé, but his countenance wore a benevolent expression, although the "billy cock" did its best to give it a ferocious aspect. I do not know how it was, but from some reason or other, I felt drawn to that man, and soon the usual civilities passed between us. These were followed by a mutual smoke and then we entered into more earnest conversation. My newly acquainted friend was an angler. He had fished all the rivers and lakes in the United Kingdom, he had trolled for whitefish on Lake Michigan, he had speared salmon on the Deveron, bobbed for masheer on the Indian streams, and cast his flies for sea-trout and char on the lakes at the foot of Mount Hecla. At least, so he told me. He talked like a fisherman, too, and there was no doubt he was a complete master of the angle. In age he appeared to be somewhere between fifty and seventy years. He looked the former but might be the latter; for, as a rule, I find that anglers "wear well." I had just concluded a short story of a good capture of heavy trout, made the year previous on one of our lakes, when my companion said it reminded him of a very large trout he was once interested in. The tale shall be told in his own words, as nearly as I can recollect them.

"It is something like forty or fifty years since," said my companion, "that I was staying in the Lake District with some friends. Wordsworth and Professor Wilson were in the heyday of their fame then, and the lakes of Westmoreland were looked upon as being situate in a spot so healthy and invigorating that a poetic genius was there inspired which could not be inhaled elsewhere. A breath of the Lake air, it was thought, would make a poet of anyone almost; and I, being young and foolish, and in love, was in a most poetic mood. It was with a view to improve my Muse that I went into the district. I hovered about Rydal Mount, I climbed the hills and rowed upon the lakes. I once actually touched the great Lake poet, and wished him a "good morning"; I trespassed upon the private grounds of Ellvay (where the Professor dwelt), and went so far as to purchase a local paper, which at that time was edited by a man then only beginning to make his mark in the world of letters, De Quincey, the opium eater. But the genial and poetic surroundings affected me not. The mountains were steep enough, and the roads were

sufficiently rough to require considerable exertion to overcome them; and in nine cases out of ten, when I returned to my lodgings after spending the day in the open air, instead of being in a mood to concoct verse, I was in a state of incipient somnolence. And so matters went on for a while, until I found that something more than mountain air and the vicinity of poets was required to make a rhymester of me. Could I even have composed anything to equal the following, a result of Wordsworth, I should have been satisfied:

“My brother Jack was nine in May,
And I was eight on New Year's Day;
So in Kate Wilson's shop
Papa (He's my papa and Jack's)
Bought me last week a doll of wax
And brother Jack a top.”

Any rhythm I ever had in me had departed, so the next best thing, and the one nearest akin to poetry, I took to—fishing. I had angled a bit on several prior occasions, and was, amongst those who knew me, considered rather an adept at throwing a fly. I had a rod with me and flies and landing-net and pannier and other paraphernalia an angler always possesses. There was plenty of fishing in Windermere and in the tarns at the top of the mountains and in other lakes, Grasmere, Rydal, &c. I followed my sport for several days with a commendable amount of success. In returning home one afternoon I met with an old man, who, after examining my trout and inquiring where I had fished, recommended me to try Low Water as being a capital place for big fish. Indeed, he said it held larger trout than any other lake or tarn in the Lake district. On making inquiry of the fellow as to the spot's whereabouts, I found it was on the other side of the lake, near Coniston, and close to the Old Man. “What old man?” said I. “Oh, t' mountain. It's a great big hill right over there,” pointing in a direction rather to the south-west of where we were standing. He moreover said there was a “girt troot”* in Low Water that nobody could catch. This settled me; and after having tea, had me rowed across the lake, and walked on to Coniston the same evening, in order that I might make my ascent to Low Water, which, by the way, lies unusually high, early next morning. I stayed all night at the Black Bull, Coniston, and of course made inquiry as to my destination and its trout. The information conveyed by the man the same day appeared quite true, and I was promised a capture of such fish as had not hitherto fallen to my lot, besides a chance of hooking “the monster of the water.” Natives to whom I talked gave some alarming tales of its size. One said it was as big as “that clock-case,” pointing to a huge old-fashioned clock, which could not be less than six feet in height and of proportionate width. Another said it was as “lang as yon table,” and the object to which he drew attention extended nearly the full length of the kitchen before the roaring fire at which we sat. The landlady put in her word, and said she had heard her husband talk of this fish often enough, and it was so big that it always broke away with any tackle by which it was hooked. Indeed, a clerk at the copper mines had once put on his rod a strong pike line, and baiting with a trout about $\frac{1}{2}$ lb. weight, had hooked the monster; which after playing some time took right across the tarn, running off all his line, and pulling the angler into the water up to his middle. The tackle still refused to break, and as the fish continued to rush the rod was reluctantly parted with, and the big trout went on his way. Two days after the rod and line were found at the further end of the tarn, and, strangely enough, the hooks were still intact, but the bait was gone. After treating the company to a gallon of ale, and making arrangements to be called and have breakfast early, I went to bed. To sleep—to dream that the big

trout was hooked the very first throw, and that, on landing him, I found him to be nothing but a minnow—a big one, though, which weighed just $1\frac{1}{2}$ lb. ! Considering all things, I did not rest so very uncomfortably after all; and by four o'clock was down and making a furious attack upon some bacon collops and eggs. The inner man fortified, and a sufficiency of provisions to last during the day being obtained and handed over to the care of the village shoemaker, who was to be my guide, we set off past the Old Haw in high spirits. It would take me an hour to tell you of all the beauties we saw in our mountain walk, and the tales and legends of the neighbourhood with which my guide enlivened what could never have been a tedious journey. Every hill and hollow seemed to have some marvellous story attached to it. Fairies played in one, and the the ghost of a murderer haunted the other. At length the tarn is in sight. We looked down upon it from the summit of a rock, which appeared impossible of descent. However, my guide soon found a rough road, by which we got down to the water's edge; and when there we rested and refreshed. In about half an hour I had got up my rod and commenced fishing. I tried all places, likely and unlikely, but without seeing a fish, and was about giving up in disgust when there was a great splash at my top fly. The fish, however, failed to hook himself, but did not fail to put the village shoemaker into a state of great excitement; be it said, I had risen the “girt troot.” The fish I did rise was one of about three-fourths of a pound in weight. Well, I fished that tarn for five mortal hours without so much as seeing another fish, naturally I became tired and disgusted, for the day was dull and there was that beautiful ripple upon the water, so much loved by the angler. The hopes of getting the big fish led me on; but now the sun had sunken behind the hills, and it was time to be “homeward bound.” I had just taken down my rod and was having a farewell look upon the waters of Low Water, when a shepherd hove in sight. The appearance of a human being in such an out-of-the-way place is quite sufficient for the shepherd to make towards him, in order to learn “how the world wags,” and how affairs progress down in the valley—such was the case in this instance. Inquiring as to our success, I, in return, asked him about the “girt troot.” “Aye,” said he, “there *was* a ‘girt troot’ here, but I fund it deeade close to 't bank, last back end. I gat it out wi' mi stick; it was aboon thirty pund weight, an' was covered all oor wi' girt lang yares like a Scotty bullock.”* “You may depend upon it,” said my friend, “I was at Coniston, and away from it as soon as possible.” At the Black Bull, I was laughed at for my wild-goose chase, and, from what I afterwards heard of Low Water and its trout, came to the conclusion that the tale of the monster was one of the legends of the vale. “Change here for Kendal, Windermere, and the Lakes,” cried the guard and echoed the porters; and alighting, and wishing my ancient friend a hearty good-bye, I left him to continue his journey alone.

THEORY OF ARTIFICIAL FLIES.

NO doubt it would not do for us all to think alike; and on hardly any subject does there exist greater diversity of opinion than upon that of artificial flies. I am therefore troubling you with this letter, in order that I may say that I do not quite agree with “Blue Dun” in the views which he has expressed in a recent issue of this paper on the above subject, and also to state my reasons for doing so. I always endeavour, when commencing a day's fly-fishing, to ascertain as soon as I possibly can,

* *Anglais.* Yes, there was a large trout, but I found it dead close to the bank, last autumn. I got it out with my stick; it was more than thirty pounds weight and was covered all over with long hairs, like those on a Highland bullock

* *Anglais*, big trout.

firstly, what natural flies are upon the water, and, secondly, to which of them the fish appear to be giving the preference. To save time, I may in the first instance mount a cast of flies that I think are likely to be on the water, but soon change them if I find that I have not hit upon the correct one. I am quite of the same opinion as the editor—viz., that you can hardly have too great a variety of flies in your book, especially different sizes and shades of the various duns and their respective spinners; and any angler of many years' experience will tell you that these must be true to nature, or else they will be of very little avail. It is quite true that in some cases you may get quite a different dressing of a fly from various makers; but "Blue Dun" should bear in mind that some flies, although called by the same name, vary according to locality. As, for instance, in talking about the March brown, it is always advisable to ascertain whether the fly known in Yorkshire as the "little early brown" is meant, or the larger fly known as the "dun drake," both being sometimes called the "March brown." As regards the "blue dun," however, I have never seen it vary very much in the dressing, excepting, of course, darker or lighter shades of wings and legs, in order to match the flies on the water, which vary as the weather becomes colder or warmer; but that fly dressed with "white hackles" on an entirely "brown body" would certainly be a novelty to me, and would not be calculated to enhance my good opinion of the maker thereof. It is rather a troublesome fly to make properly, especially in the ribbing of the body, so that some fly-dressers—viz., those who go in for cheapness—are apt to "scamp" this part of the business; but that trout (even during the early spring months, when they are supposed to be less critical than they are later on in the season) can fully appreciate the correct dressing of this fly, I think the following incident will amply suffice to prove:—Three years ago this coming April, I was fly-fishing on the Yore, in company with a local sportsman; the fish were rising freely at the blue dun, and by dinner-time I had basketed a dozen good trout, almost all on this fly, whilst my companion, although a first-rate fisherman, had only four. On examining his cast I found that his blue duns were not ribbed with yellow silk like mine were, but the bodies were thickly dubbed with fur from a hare's ear, through which the silk hardly showed at all. I then felt certain that this was the cause of his want of success, and on putting two flies of my pattern on his cast, he soon commenced to take fish; and when we finished at night he was not far behind me in point of numbers.

Any one who has been fortunate enough to peruse Mr. Aldam's splendid work on artificial flies cannot fail to have been struck with the remarkable story which he relates in his foot-note explanatory of the "Taily Tail." In it he states that one day, when fishing on the Derbyshire Derwent, he and a friend had remarkable success with this little fly, which is the female of the black gnat. They had previously tried the male fly and several others that were on the water, and had almost exhausted their stock of patience, as well as the contents of their fly-books, when Mr. Aldam caught a trout, which he cut open, to see what the fish really were taking. He found a mass of these flies in its stomach, and immediately put two upon his cast. The result was instantaneous, and, after basketing several fish that he had thrown over previously with no visible effect, he came out of the water and rigged up a cast of them for his friend. The result was that they both of them killed a splendid dish of fish, whilst other five members of the club only killed two or three amongst them. I could recount endless incidents to the same effect that have come under my own personal notice and that of my friends. In fact, as each season passes, I become more firmly convinced of the necessity of having a full working supply of imitations of all the principal insects that from time to time appear on the water during each

month of the season. Some anglers go to the length of dressing their own flies by the river-side, but I cannot say that I agree with that practice; for, in the first place, it involves carrying about with you a large quantity of materials, which, even on the calmest of days, are not very easy to manipulate on the banks of a stream and, in the second place, very probably by the time that you have got your imitation completed the rise is just completed also; whereas a fly is taken from your book in a moment, that is, if you keep it in proper order. I consider that on such well-fished rivers as the Wye and Derwent in Derbyshire, or the Yore and Wharfe in Yorkshire, it would be simply ridiculous to attempt to kill a good dish of fish by adhering to Mr. Pennel's theory. It might possibly answer on some preserved waters, seldom disturbed, but even then I should be sceptical on the point. Besides, I consider that it takes away half the pleasure of fly-fishing to limit yourself to three or four patterns; for, to my mind, the chief enjoyment of this kind of fishing is to match your flies with those upon the water, and then, by casting them lightly as thistle-down, deceive the fish with an imitation of the very fly that they are feeding upon. It is an endless study, and one in the pursuit of which even the most veteran angler learns something fresh almost every day. I could enlarge upon it *ad infinitum*, but have already written more than I had at first intended, and with an apology to you for occupying so much of your valuable space.

FRANCIS M. WALBRAN.

[We agree *entirely* with Mr. Walbran, and have, months ago, said—as he says—that Pennel's system robs fly-fishing of half its charm. Why, what would become of the ever-to-be-remembered chats with a brother angler over the fly to use, or which has been taking, if we could not pull out our fly-book with its fair array of favourite flies and compare them with our friends'? Every fly has a history of its own, and that little bit of rusty metal, faded feather and frayed gut, instantly brings to one's mind some charming English landscape, in which it played a part. No, we advise our fly-fishing readers not to stint the variety in their fly-books; and to open the first trout, or grayling they catch, and then put on the nearest fly they have to the specimens the fish has been feeding on.—ED.]

SHETLAND AS AN ANGLING RESORT.—VI.

AS to the angler's outfit for Shetland that will, of course, depend much on individual taste. We ourselves generally take two stout, stiff rods, the one about thirteen feet in length, the other about ten, and we think anglers generally will find these quite sufficient. We once tried a seventeen feet rod, but whether it was that we cast too far out and past the ordinary lies of the fish, or that we did not cast so often, and therefore covered less water, we had far less success than when using a shorter weapon. As to hollow butts they are usually too weak to bear the rough usage they get in Shetland, as it is often necessary to fish dead in the teeth of the wind (and it knows how to blow in these northern regions). We have a lively recollection of one day in Coelister, eight years ago, when we took the leeward side of the loch, whilst a friend took the other. We had to fish with a light nine-foot rod against a fresh breeze, and after about two hours or so of fishing, first the hollow butt of the rod gave way, and then our reel, which we had tied to the lower end of the remainder, went to pieces. In this condition we persevered, and at the end of the day our basket held nine fish of twenty-four pounds weight; our companion had seven which, being larger, weighed almost exactly the same. We also lost several fish after the breakdown of our tackle. Therefore, we say, don't bring a hollow-butted rod to Shetland if you have another likely to serve the same purposes; if you do get it broken, you won't get it mended in Shetland.

As to flies, there is no need of a pocketbook full of applied entomology; the Shetland loch or burn trout will generally seize anything in the least resembling an insect; nor does he boggle at a biggish hook; though we confess to thinking No. 7 or 8 Limericks sufficient to land anything one is likely to come across here. The sea-trout are just as little particular, and the question really seems to resolve itself into what color or colors are likeliest to attract attention. Generally speaking, a red or orange body is best, but at times a green or black body does as well, and all flies should be ribbed with silver tinsel; usually, too, a pale yellow or white tag is of advantage. Having already mentioned several flies, we need scarcely go over the ground again, so shall only mention that certainly quite two-thirds of the sea-trout we have taken here were caught with a claret-hackle having a warm orange wool body and lemon wool tag. We invented this fly some eight or nine years ago, and have always found it doing its fair share of work in peaty lochs. Next to it comes the red-bodied teal-wing with either black or red hackle, and a good third is the same fly with a green body. Our other great favourites are the woodcock wing with red body and hackle, and then the good old red hackle, with red or purple body. With a couple of dozen or so of these dressed on good medium gut, neither too fine nor too coarse, you may feel pretty safe of sport all over Shetland. You will be none the worse of sixty yards of line on your reel, as, though the fish generally hug the shore when hooked, one does now and then bolt for the centre of the loch.

There is another district of Shetland with which we are pretty well acquainted, but in which we have never been lucky enough to get accommodation; this we may call the Vidlin district, as, if accommodation can be had anywhere, it will be there. There is also a large mansion house at Lunna, which is often to let during the summer, and some friends of ours stayed there and had good sport. We shall only refer to its capabilities briefly. Where the road to Vidlin leaves the main northern road, about eighteen miles from Lerwick, it skirts a capital trouting loch, known as the Loch of Voe. A little further on a smaller loch is seen on the right hand, from which a stream issues. This loch is called Savewater, and the burn the Laxburn. After a course of some three and a-half miles, this stream is joined by another quite as large, which comes from a large loch on the left hand of the road (from which, however, it is not quite visible), and after a farther course of about half-a-mile, falls into a small pool into which the tide flows. Sea-trout and good loch-trout are found in both lochs, and also take freely in the burn. At Vidlin itself there is also a loch into which we are told that sea-trout enter freely at times, and there are many small lochs round about containing common trout. The "peerie steamer," *Earl of Zetland*, calls at Vidlin, so, if lodgings can be had, it is an easy place to get at.

We are told that splendid fishing may be had in Northmaven, and once started for Hillswick, but luckily heard at Brae, near the famous Mavis Grind, that there was no chance of getting put up; so took boat for Unyifirth incontinent. Now, however, we believe accommodation of a first-class description is to be had both at Ollahery and Hillswick, and from what we have heard from others, believe a person going there would enjoy good sport.

To conclude, we give a synopsis of probable expenses, which we believe may prove useful, calculated for three weeks, dating from Leith. Fare to Lerwick and back £2, food on board £1, hotel (one night) 10s., say; mail-gig to Walls and back 16s.—with luggage, say £1; lodgings, sixteen days at 5s., £4; incidental expenses £1; total £9 10s. Lodgings at Wiesdale run about 3s. to 4s. per diem; therefore, by staying there you may save more than £2, as you have only half the mail-gig fare to pay. This we consider a fair estimate of the probable cost of the trip.

It may be done for a little less, or it may be made much more expensive; but we do not believe that equally good fishing can be got anywhere for a similar expenditure, and we heartily recommend it to all those to whom time is less of an object than expense. More particularly do we recommend it to those recovering from tedious illness, and standing in need of a bracing climate. To such Shetland offers all the advantages of a prolonged sea voyage, without many of its inconveniences. There is also a curious old-world feeling about the islands, which, enhanced by the infrequent mail service and the homely habits of the people, gives rise to a feeling of repose very grateful to the hard-worked Southron.

SCOTUS.

THE END.

BOROUGH HEAD.

THIS portion of the Thames is well-known to most jack and perch anglers as remarkable for the capture of those fish, more especially towards the close of each fishing season. It is situated between Chertsey and Laleham, and, in addition to the one particular portion of it, is all good fishing-ground for jack and perch as far down as Chertsey Weir, which is one of the finest weirs on the Thames. But I want to refer more especially to what is called Borough Head, and, although I cannot speak of it particularly, as regards the captures of such large jack as those in Hampton Deep, it has always afforded good sport for numbers, and of a fair average size. There is a piece of back water running out from it into which, after a flood, large quantities of jack and perch have been left; and, until the last few years, it has not been netted for the recovery of the stray fish, because it has become so choked up with weeds that it has not been found possible to do it. I remember doing this on one occasion, when we got out a splendid lot of jack and some grand specimens of perch, besides a magnificent example of a 6 lb. tench, which ought to have been preserved, as I have never seen one nearly so handsome as this one, and of so golden a yellow. This was the first time of the netting of back waters, and one of the anglers at that time reported it to the Thames Conservators, who, instead of offering any remonstrance, regarded it a necessary and praiseworthy operation. I do not know of any much better place than Borough Head and its neighbourhood to fish for jack and perch just after the water has nicely run down after a flood. On one occasion, and it is now some years ago, I well remember Mr. James Forbes, of Chertsey Bridge spending a couple of hours one Saturday morning in fishing for perch at the Borough Head, and in that short time he caught 110 fine perch, many of them weighing 1 lb. each. He was attended by his old and experienced fisherman, the veteran William Galloway, who, I am glad to find, is now still hale and hearty. I have fished this particular swim myself for perch with Frank Harris, of Laleham, as the fisherman; and it was astonishing the quantity of perch I got on one occasion; but having a novice with me as a companion, the result was not so good as it might have been, still I was perfectly satisfied, and that is the feeling all anglers should possess, though I do not pretend to set myself up as an expert. I could mention the names of anglers who in their day and generation made the Borough Head their favourite resort for jack, and I have seen their takes and witnessed their achievements with a great deal of pleasure. Although I have not fished it of late years, I have no doubt it still retains its old prestige, and there are still anglers who regard the place as well worth a visit. I have very little time for angling now, but if I wanted a day's jack and perch fishing, I should be inclined to select the Borough Head. It can be approached either by way of Staines or Chertsey, and at both of these places there are capital hosteleries for good and comfortable accommodation. At the former place there is the Rail-

way Hotel, and also the Pack Horse; and at Chertsey which' perhaps, is the nearest point, the Chertsey Bridge Hotel has some good recommendations. The worthy host, Mr. G. H. Thurston, is an angler, and a member of one of the principal London angling clubs; and although absent in the day time through a business engagement in London in the sale of Scally's Bonded Irish Whiskey (which I would recommend my brother anglers to taste from samples which I have no doubt he has at Chertsey) his absence is well made up by the attention of Mrs. Thurston to those who patronise the hostelry. And there is this other recommendation to anglers visiting Borough Head in this direction, that the monster jack which was put in close to the Hotel from Kew Gardens is still at large. At the time it was turned in it was an 18 lb. fish, but it must have got much heavier by this time, as its particular weakness for eating young ducks has been largely developed, Mrs. Thurston having had serious cause to complain of the disappearance of two broods of young ducks on the water, which are put down to the well-known proclivities of the jack in Kew Gardens, of which this one is evidently a remarkable type. I saw a letter from James Haslett, of the Woburn Arms, Addlestone, the other day, and he is one of the Chertsey fishermen, recommending one of his customers to come down, with the additional inducement, "The big jack is still at Chertsey." A good day at Borough Head, and the capture of a 20 lb. jack at Chertsey, would indeed be regarded as a great piscatorial achievement, and it may be possible even to accomplish such a result. I do not say it is probable, but, at the same time, it is not quite unlikely. I can imagine my friend, Mr. G. H. Thurston, on his return from London on such a day, would be delighted as any one to welcome the worthy angler after such an attainment and, for the sake of the future safety of her young ducks, his good wife would, without doubt, be well pleased. B.

PISCICULTURAL EMULATION.

A WATER-LOCKED land, such as England, should ever be watchful of its aqueous resources. Such a truism hardly needs to be repeated in these columns, were it not that apathy upon so important a subject has reigned until quite recently. Not but that the earlier pages of our history do not furnish ample evidence of the perception on all sides of the importance of conserving and improving the fisheries of the island. On the contrary, the Roman Catholic domination greatly fostered fish-culture; and previous to the Reformation great attention was paid to the rearing and fattening of fresh-water fishes, and to the laws regulating the ocean fishes of our shores. From those times, to within a decade or two, the importance of such an industry seemed to lapse from the minds of social economists, and until men like Buckland and Francis roused public attention to the matter, and until the American fish-culturists began to realise their magnificent resources, English authorities were content to remain in tranquillity.

The last few years have seen a great change, however—thanks primarily to the late Frank Buckland—and it is instructive to notice how emulation has arisen amongst all classes interested in our fisheries. The Museum of Fish Culture, at South Kensington, has unquestionably had a great hand in this change, especially when under the direct control of its gifted founder; and the secrets of artificial incubation, and, consequently, of the inner natural history of fishes, are no longer hidden and recondite, but plain, and well recognised by a rapidly-growing crowd of fish-culturists and angler naturalists. From such knowledge, of course, emulation and subsequent improvement of methods and implements infallibly emerge, and then we find that piscatorial gatherings vie with each other for priority in results, and that exhibitions of

piscine interest are prominently to the fore—witness the National Fisheries Exhibition, to be held in April at Norwich.

The Berlin International Fisheries' Exhibition, at which many of our prominent fish-culturists (including the late Mr. Buckland) and tackle-makers were well represented, probably did a great deal to bring forth into fruit the seed of the interest sown, many years ago, by the two French fishermen and our own fish-lovers. The extra prizes at Norwich alone will amount to near upon a thousand pounds, and will include awards for essays on "Fish-culture as a source of national wealth," the diseases of fish, as well as models of salmon passes, of breeding houses, boats, *et hoc genus*. Furthermore the Home Office has lent its aid, and it is announced in the FISHING GAZETTE that their Royal Highnesses the Prince and Princess of Wales have definitely decided to open the exhibition. Under such favourable auspices, the affair cannot but be a success, especially as it is a fact that almost every prominent tackle manufacturer has entered an exhibit.

The bearing which such practical competition has upon the fisheries of this country is obvious to the most obtuse. An impetus is given to an industry which is of the most vital importance to a thickly populated and water-locked country. The laborious investigations and excellent suggestions to this and former Government inspectors of fisheries, have a real chance of showing their efficiency—possibly indirectly, but nevertheless really. Another consideration also forces itself upon us in the rapidly growing love of inland fishing in anglers. Not a week passes in either of our large cities but an angling fraternity is established. In London alone, the number is so large that the railway companies find it expedient to extend concessions to the members of most of them. Sheffield and Manchester are almost as enthusiastic in this respect as the metropolis, and in the kingdom it may be safely computed that there are at least 60,000 persons who make angling their chief recreation. In light of this, fish-culture must of necessity be stimulated, and the emulation to which we have referred is a healthy sign of the progress of the times. An Englishman's love of sport is proverbial, and it would be a regrettable day when its decadence could be demonstrated. Angling is one of the most harmless and fascinating of all recreations. To utilitarians, such an item—as a nation's ocean and river fisheries—is an item of speculative import; and it is therefore with gladness we notice the emulation which seems growing in connection with such matters.

A NEW WORK ON TROUT-FISHING.

MR. THOMAS FORD, of Caistor, Lincolnshire, sends us a copy of his recently-published work, "Trout-fishing." It is most carefully written, and the price is only one shilling. The descriptions of 130 flies which it contains are most valuable, and in addition it has some sensible remarks on the various methods of fishing for trout and the best tackle and rods to use. It is thoroughly worth a shilling; in fact, we can only find fault with the statement that fly-fishing is "gentle exercise." Our experience is that it is the most delightful but hardest of work; at any rate, we have found wading seven or eight miles against the current of a roaring trout-stream strewn with slippery boulders, and throwing the fly eight or ten times a minute, is anything but "gentle exercise."

TO ANGLERS.—W. J. Cummins, Fishing Tackle Maker, Bishop Auckland, is now prepared to forward to anglers his Illustrated Catalogue, which is not only a Trade List but is interspersed with practical hints, useful directions, and valuable information gathered by the river-side from twenty years' experience. The stock consists of his unrivalled Salmon, Trout, Grayling, and Pike Rods, Lines, Reels, Baskets, Artificial Baits, Fly-books, Landing Nets, Gaffs, and last, but not least, his celebrated Trout Flies, which for killing powers stand unequalled. Every article kept in stock is of the very best description.—[ADVT.]

MRS. F. Y. BROCAS, Artificial Fly Dresser, 4, Mill-street, Conduit-street, Hanover-square, London, W. A stock of best flies always on hand. Flies made to pattern. Lessons in fly making given.—[ADVT.]

RIVER REPORTS

FISHING GAZETTE Office, Friday, noon.

WE fear the continued downpour of the last twelve hours will again put the rivers out of order, and the "meteorological" officials promise nothing more encouraging than "rain or snow." It is a blessing they are not always quite right in their prognostications or the angler's life would not be worth living.

MID-THAMES.

"Our doubts are traitors,
And make us lose the good we oft might win
By fearing to attempt."

—SHAKESPEARE.

Little has been attempted and little done in the fishing line during the past week, although the condition of the Thames is everything that could be desired for winter angling. The stream is still very rapid in consequence of the weir tackle being open, but there are thousands of quiet nooks and corners, besides boughy haunts, where logger-headed chub can be beguiled therefrom with the succulent nerve matter from the backbone of the bovine species, or with the most tempting and killing of bait, in my estimation, the wriggly tail of a bright, flat, well scoured loebworm. These haunts are also frequented by perch, roach and even jack, all of which scaly beauties are only too glad to get away from "a flood which leads to"—well to destruction. At Boveney and Bray some excellent chub and perch have been had, and also at Monkey Island the details of which the ever-green Bob Plummer will doubtless supply the readers of the GAZETTE with. At Bourne End, Mr. Brooksbank has been to the fore with chub and roach, and several local anglers have done fairly in these always good waters. From Marlow I glean that Mr. Stockbridge has had a jack of 6 lb., and Dr. Carpenter, with Tom White, fishing under Quarry Wood, a beautifully-conditioned jack scaling 12½ lb. A gentleman, with Young Shaw, on Tuesday took two jack of decent proportions, other anglers have also done well in these waters, and if fishermen will but come down and brave that *déte noir*, the east wind, good bags are sure to accrue. At Temple, the brothers Coster have been amid the perch, on one occasion, getting some 11 doz. of these fresh-water soles. At Hurley and Medmenham some bank anglers have been well on the roach and chub, one of the latter scaly beauties being weighed by the obliging hostess of the Black Boy, an 1 going 4 lb. From Henley, once more my obliging correspondent sends me a pennyworth as follows:—Mr. Towsey, fishing near Marsh Lock, two jack, one going 7 lb. and his brother 4 lb., besides a good basket of decent perch; Mr. Johnson, with young Parrott, some good perch; best 2 lb.; C. Hamilton, one jack 7 lb., and six brace of perch; Mr. Phillips, with Haavey, 20 lb. of chub and perch; Mr. Witham, two jack, 6 lb. and 3 lb. respectively. Otters have been very busy of late in the neighbourhood of Henley and Shiplake, the remains of several good fish having been found, notably that of a carp going 8½ lb.—a fish which, when whole, must have scaled 11 lb. at least. From Reading, Maple Durham, and Pangbourne I hear that perch and chub are being had in galore.

THURSDAY EVENING.—River in splendid trim. Big bags must be made by those who know how to go to work if they will not fear to attempt.—MARLOW BUZZ.

Thames (Going).

Water in good order for jack and perch. Saturday two jack going 8 lb., and some good roach; Monday, 4 jack; Tuesday a gentleman from 48, Warrington Crescent, Maida Vale, London, 3 jack, going 12½ lb.—JOHN RUSH.

Thames (Twickenham).

The river is now in good order for fishing. I have had some nice takes of roach and dace during the week. Mr. Beard took 9 dozen good-sized this day (Thursday), with a very bad easterly wind.

N.B.—I have much pleasure in acknowledging the receipt of £2 from Capt. Moss of Hanwell, and 15s. from Mr. R. Vart and friends, the Ship, Lime Street, City, for Tom Brand.—ALFRED PIERCE.

Thames (Windsor).

Water in prime order, has fallen considerably since my last, and is now an excellent colour. A good many bank anglers have been braving the cold winds of the last week, but with the exception of a few, nothing much has been done. Mr. Lumsden, of Etonwick, last Sunday had a nice jack of 8 lb., 2 dozen of roach and perch, and nine gudgeon. Mr. Parsons, of Windsor, had a nice dish of roach, going about 8 oz. to largest, 1 lb. 3 oz., and Mr. Stewart, in the lock cut, took a nice little dish of perch. Perch, jack, chub, and roach are to be had now from under the boughs and old pollard stumps. Some thumping great chub ought to be got in the quiet bends and eddies. Jack and perch are on the *qui vive*, only waiting for a fat dace or plump minnow.—R. R. BAMBRIDGE.

Avon (Christchurch).

I am glad to say this river is now in good order for fishing. A brace of fine pike were taken yesterday in Mr. Newlyn's water. The salmon fishing has opened well. At the mouth of the river, known as the "run," a fine male salmon was taken last week of 38 lb.; on Saturday last two female fish, of 21 and 20 lb., in perfect condition; and yesterday a pair, of 24 and 25 lb. each.—T. J. M.

Devon (Ilfracombe).

There have been fair catches of grey mullet, small bass, whiting pout, plaice, dabs, &c., caught this week with rod and hand lines from the piers. We find mussel or thornback's liver the best bait for those fish. Richard Rice and party shot a small drag net or seine in the outer pier on Tuesday last, at low water time, and enclosed a fine lot of mullet and bass, but in hauling the net

on to the beach it burst in the boat, and instead of landing three or four cart-loads, they had to be content with scrambling up about four cwt., all the others made their escape seawards.—HENRY COSMER.

Dove (Derbyshire).

This river has been in grand condition all the week, running at nice height and in rare colour. Snow, however, has been nearly a foot thick on the ground, and since Saturday there have only been a few rodsters out. Some nice jack have fallen to the attractions of the Devon and a few barbel are reported to have come to hand from the lower waters. The Trent Fishery Board are about to impose a trout license of one shilling per rod. It is certainly not a big sum to pay, and I don't think anybody will be mean enough to object to it. I can hear of but few grayling having been captured since my last. Surely the weather will improve before the close time sets in, just to give us one more chance of making up for about the longest and dreariest winter ever known on the Dove.—THE SPODGER.

Dulverton (Somerset).

The rivers are very low and clear, too bright for good angling. The weather now is bitterly cold, wind almost due east, and until it changes and we get a little rain, with milder weather, fishing will be almost at a standstill. Very little sport has been had during the past week. A few trout have been taken, but not many, with the blue upright, February red and silver twist. The last two or three nights we have had 12 degrees of frost.—W.

Exe (Exeter).

During the past week the weather has been magnificent, suitable for all kinds of out-door sport. The easterly wind certainly was rather searching, but soon forgotten in the bright sunshine, by those who to the trout stream swiftly hie, and there shake out the trembling mimic fly; such was done by a few during the latter part of the week, but with very poor success. The river was getting down in splendid order, and many were the appointments for this week, but alas, we are once more in the depth of winter again, which recalls the words, "The hackles light as random snow"; and random snow we have had, commencing on Sunday morning and lasting until dark, when between two and three inches had fallen, and with a severe frost during the night, has not increased fresh vigour to the jaded mind. The sun is certainly gaining power, but out in the open fields the frost has not given in the least, and there is every appearance of a very sharp night and probably more snow. A few trout have come to bank, but not of any size, and report states that there were never seen so many spring salmon in the river so early before, so that both anglers and netmen may look forward for a good season. Very few kelts have been seen going back. No doubt that when the river came down in such a raging torrent, overflowing the banks and submerging the meadows, an immense number were hurriedly carried down to sea. The estuary men are again at work, for the herrings have unexpectedly returned, and their catches have reached 10,000 to 12,000 a night, which have made from 27s. to 30s. per thousand. Other fish scarce, and likely to be until we get into more settled weather, and then, with health, and rod and liberty in ample store, we will haunt and fish the trout streams. Say, who could wish for more?—FRANK GOSDEN.

Lee (Co. Cork).

Nothing of consequence has been done on the Lee during the past week, and there appears to have been as little on the Blackwater. The easterly winds "Boycotted" anglers on Thursday, Friday, and Saturday, and on Sunday a slight fall of snow was followed by a severe frost, which set in with all the rigours of winter, and lasted over Monday and Tuesday. On Sunday—the only day I can enjoy with freedom—I went out with a few friends, and though the weather presented a cold and cheerless aspect, we had a fair share of sport. Two fine springers fell to our rods, one being a regular beauty of 12 lb., caught on a lemon-grey. Several other fish were hooked and lost. One of the party met no less than five fish, and failed to land any. On the same day a springer was landed at Carrigwhid, near Macrom, and since then I have heard but of one fish being taken—a fine springer of 14 lb., killed on Tuesday by a farmer residing near the bank of the river. The cold weather has been against piscatorial exercise of every kind. Few trout anglers have been out. Those who faced the cold were ill rewarded. As I write, however, the weather has undergone a favourable change. The grey frost of Tuesday night was succeeded yesterday by a complete break. Last night a heavy storm prevailed, with torrents of rain. To-day the Lee is swollen, and the snow-water as well as the "slats" will be cleared out, and the river be prepared for more successful operations than have hitherto characterised the angling on the Lee.—ANGLER.

Medway (Tunbridge).

The weather has fined down beautifully, and is just what anglers are pleased to see for winter fishing, but the wind during the week has been bitterly cold, and very few anglers have been out. Jack will be on the feed as soon as the wind changes from the east, and a dace will be a killing bait. Roach, bream and chub will readily take a brantlin. This week one angler got a brace of jack below the town, one scaling eight and the other five pounds. Roach have been plentiful and of large size, one weighing 1½ lb. Last week Foster, the water bailiff, trapped a dog-otter in the fishery, which weighed 12 lb. and measured 42 inches from the top of nose to the end of tail.—YE MEDWAY WATER RAT.

Shepperton and Weybridge.

Since the floods have gone the water is in good condition for angling. Very good for another week for jack, perch and roach fishing. I have myself been out with a gentleman the last two days, for the first time since the flood, and caught three jack and half-a-dozen nice perch, the largest jack weighing 9 lb., and one of 4 lb. and one of 3 lb. H. Kerr, of Weybridge, caught one jack of 8 lb.—W. ROGERSON.

Suir and its Tributaries (Clonmel, Ireland).

The weather still continues very cold, with occasional showers of snow. Last week was the best with the cot-fishers—the two Clonmel Clears killed thirty-seven salmon. The rod-fishing is quietly progressing. Mr. Thompson, at Kilmore, killed two spring fish; Mr. Dolton, one, at Athassel; Tom Russel, a small one of 7½ lb., at Molough; and Mr. Quinlan, two, at Suirmont, weighing 13 lb. and 14 lb. respectively. Mr. Cook was the first that killed a fish on the upper waters at Newcastle this season. Mr. Hutchings, at Barnard, hooked a fine spring fish, but did not succeed in gaffing it. The trout are not rising freely to the fly on the Suir yet, owing, likely, to the intense cold of the weather and so few natural flies as yet to be seen on the water. Mr. Middleton, on the quay at Clonmel, killed some fine trout with the minnow, with which fishing he is always most successful. The gold wren is the favourite fly at present, the fish are probably taking it for the March-brown, which is the only fly to be seen on the water now—it does not usually make its appearance till

the middle of this month. If the weather gets a bit soft, we expect to be able to tell of good sport for next week.—DORA.

Thet (Norfolk).

The angling society held a meeting of its committee a few days since, and it was decided to have their first angling competition between the 1st and 14th of March, both days inclusive. All the fish are to be caught between the Town Bridge and Santon Downham Bridge, and weighed on the day caught. The prizes to be awarded are for the largest pike, 1st, 21s.; 2nd, 10s.; and the largest perch, 10s. 6d. It is expected that some very fine fish will be caught.—ANGLER.

Trent.

In this locality I have not heard of a single angler visiting the river the past week. Writing to-day our keeper remarks that both the Trent and Tame are rapidly going down, but the water in the Tame still very much discoloured from the melted snow which fell in this district last Saturday. Trent in fair order but not quite right; if there is no more snow it will be in something like order by Saturday. Wind very cold; anything but like fishing weather.—JAMES GREGORY.

Trent (Newark).

We regret to say we hear from the wife of the "Trent Otter" that he is much too unwell to send a report this week. We are sure all our readers wish him a speedy recovery.

Trent (Nottingham).

The water in the early part of the week came down much discoloured, which was caused doubtless by the snow melting so quickly both in Staffordshire and Derbyshire. The river, however, only rose a few inches, but the water for several hours was too thick for the fish to see a bait; a change, however, took place for the better between Monday night and Tuesday morning, which was soon noted by a couple of our noted rodders, who at once started to a favourite length of water in the neighbourhood of Burtonjoice, and after selecting suitable swims soon found the roach and chub ready to feed on worms. Of the latter fish seven were caught, averaging over 3 lb. each, and two of them weighed some ounces over 4 lb. each. The sample of roach also was good, most of them going nearly a pound each, and altogether the catch was 40 lb. in about four hours. On Wednesday several nice bream and some capital roach and dace were taken with the same bait—a cockspur worm—and although there must have been snow in the waters, the anglers who were out on Tuesday and Wednesday say the fish bit well. The water to-day (Thursday) is in capital order for bottom fishing, though the wind has been blowing cold from the east, which is sure to take the fish off the feed, or nearly so. The backwaters are in good condition for pike fishing, and several nice jack have been taken with live bait. If the snow will but keep off there will be a chance of some good sport for some days to come.—W. BAILEY.

Wye and Derwent (Derbyshire).

I have not heard of a single angler turning out on either of the above rivers. Since my last report, owing to the great quantity of snow that has fell, and the severity of the weather. The snow seems to be going a little to-day (Thursday), but it bitter cold, with hard prospects of angling.—GEORGE JAMES EATON.

Yare (Norwich).

Some good takes of roach, dace, perch, &c., are again reported this week, Mr. Walker Capon, of White Lion Street, being again to the fore. He exhibited a splendid lot of fish at the E. A. P. S. club-house, on Tuesday, including some remarkably fine dace, the entire catch being taken at Postwick Grove, and in not more than three feet of water. It was quite a sight the other morning at Thorpe, for I counted no less than a dozen boats on the small broad, and with no wind and the sun shining brilliantly, one could almost persuade oneself it was May instead of February. The pike match of the Norwich Angling Club was a decided success, a full report of which will be found elsewhere. I am sorry to have to complain of one or two incidents connected with our river this week. First, a correspondent, who signs himself "Fairplay" in your last week's issue, complains of some "gentlemen" netting in the Wensum, at Thorpe; one could scarcely have believed that such an act would have been perpetrated by the most daring of poachers, so near Norwich, let alone by those so-called "gentlemen," and although not doubting the veracity of "Fairplay's" statement, I determined to find out if any one had had the audacity to do such a thing, when strangely enough, I fell in with two anglers who witnessed the whole affair; and, what was still more contemptible in these misnamed "gentlemen," after inquiring of "Fairplay" as to his success, actually cast their net completely into his swim, thus, not only capturing some very fine perch, but entirely spoiling his sport. "Fairplay's" temper was one to be envied on this occasion, as after simply remonstrating with these "daylight marauders," he drew his moving poles, and rowed away, leaving these "gentlemen" to enjoy their quiet little game. Surely when we have a "Yare Preservation Society," which provides water-bailiffs and all necessities for the protection of our rivers, such diabolical acts as these are simply disgraceful, both to the so-called "protection society" and also to those gentlemen who lend themselves to such mean actions. Inquiring of my informants if these gentlemen were known to them, they told me they were, and came from a large establishment close to the spot where they were carrying on their nefarious pastime. I think our thanks are due to "Fairplay" for bringing this matter before the public, but they would have been more especially so had he demanded from them their names and addresses, which even he, as a private individual, could have done. Presuming this kind of thing to be allowed, I think the best thing for our anglers to do is to arm themselves with the "Belgian devil," so as to be prepared against other similar attacks. My next complaint is perhaps a deal more serious than the first, and that is the pollution of our river from the sewerage during the last week. I, in conjunction with two friends, visited the pumping station of the sewerage works at Trowse, on Wednesday last, for the purpose of having some dace fishing, when, judge of our surprise on finding the stream one mass of a white thick substance, and being carried with the tide towards the main rivers. Whether this is as it should be, I am unable to say, but on communicating with Mr. John Hart, of the Thorpe Gardens, he informed me the river had, during the past few days, been almost unbearable. He says: "Huge masses of filth come floating down with the tide, and after getting completely saturated and too weighty to continue their journey, they sink to the bottom, and then as soon as the weather sets in hot, it rises to the surface again, the results of which, in summer time, may be easily imagined." Upon inquiring why this matter should be let into the river, Mr. Hart says that the "Corporation Farm, which was hired for the purpose of receiving this sewerage, has been so completely saturated with it for the last fifteen years, that the land now refuses to accept any more, and will really not absorb it. He informed me he had placed the matter in the hands of some gentlemen residents in Thorpe, who had promised him to lay it before the proper authorities. Surely this is another grievance the Y. P. S. ought to look to.—ANGLER.

OTTERS AND HOW TO CATCH THEM.—III.

IN connection with the large otter traps, before using them some means is necessary whereby to secure them to the ground and prevent them being borne away by any otter caught. To each trap a chain is attached, of sufficient strength to preclude its being broken, and having at one end a round ring, and provided in its length with one or more swivels. These chains may be in length according to the fancy of the person employing the traps, some preferring a long one about 13 feet, others a short one of two. In the case of the former the vermin—of its own accord endeavouring to reach the water when captured—drags the trap by its leg into the stream and is drowned, the chain restraining it from going right off, and contributing considerably to the weight. In the second instance, the chain simply serves to attach the trap to the stake by which it is secured to the ground. Stakes may be made of any sort of wood, we prefer and recommend ash, being tougher and holding better, while more conveniently shaped-out than other woods. They should be 2 feet long, as sometimes the ground is very soft and yielding, offering scarcely any hold at all. The stakes should be split out of a straight piece of ash, "smaked" down sufficiently to receive the ring, which must be easy to drive on up to within 3 inches from the top, when it must be gently tapped home, as rough hammering is very liable to crack the iron, an undesirable occurrence.

It will probably be in softish ground that these large gins are employed; at the most often passed landing place of the otter. Having determined upon a site, lay the trap down with the catch side away from the water, and having—if a short chain—extended this to its full length; if a long one, to 2 feet of its extent; drive in the stake as tightly as it will go, and ascertain that there is no doubt whatever as to its being perfectly secure. For a trap with a short chain, having driven the stake, next form a hollow which will neatly contain the gin when set deep enough to allow the plate to be a shade beneath the level of the surface. Then carefully set the trap, giving all forethought as to fingers and such, like. Having set, place the trap in position, and having put a small stick over one jaw and under to support the plate, commence covering at the chain and so down till the jaws are reached. To cover these, some usually employ a sieve and sift the earth or sand over; but if dispensed with, sufficient earth to cover must be heaped upon and be outside, and be evenly and gently smoothed over, the jaws, plate, &c., until everything is concealed, the plate meanwhile being prevented from falling by the small stick held beneath it. When the setting is complete, a large bunch of gorse, broom, or branch of a tree must be obtained, and having been well wetted in the adjacent water, it must be shaken over the trap, chain and any footprints left by the person on the ground until all trace of same and scent is completely dispersed; for we must observe that any signs of a suspicious nature would be very much lessen any chance of a capture, hence the above precautions.

The employment of large-sized rabbit-gins for catching otters is both necessary and advisable under the remaining conditions where these river vermin may be trapped for, when it is impracticable to use the larger ones. The largest size of rabbit traps made measure 5 inches in the jaw, and are therefore handy enough, while still offering, when set, a large space in which the otter can put its foot. The best traps of this sort are obtainable of either of the makers we named, and if they be chosen with a view to the strength of the spring, engines quite capable of retaining the hard leg of the otter can be easily obtained. These gins require stakes fitting to them, of a similar nature as to the others, only not so long, 15 to 18 inches being quite sufficient. When the necessary number of gins are prepared, one may proceed to set them, choosing the middle of the day as

decidedly the most suitable time to undertake the operation, as it will then allow any scent left to work off before the otters stir abroad.

In order to be at all successful, careful observations of the banks of the stream or pond must be made, to ascertain, as certain as possible, if not the only spots where the otters land, at least those where they more frequently do so. They have always one or several such places to which they swim with captured fish, or when simply leaving the water. There are sure to be spots of the kind indicated in our former article, and are distinguishable by the presence of the "seal" left by the otter's foot, a print quite different to that of any other animal, more especially on soft or sandy shelving banks are these pad-marks most prominent. Having determined as to these, the traps may be set either in the water or on the land; we prefer the latter position. If the former, set three or four of the gins, take them well down, and place them in the water, in such place that the varmint, when landing, perforce, in order to effect this end, puts a foot on one or more of the traps, and, being caught, it will probably get into difficulties with the others near. Care must be observed when killing thus, not to put the trap too far into the water, or too deep, otherwise anything would probably swim over them; otherwise they are often enough effectual, and it is not at all an unadvisable plan to provide all likely places of this nature with one or two gins set in the manner indicated. If the "killing" of the traps is to be made on the ground near the water's edge, they must be placed according to what one may consider to be the most likely way to produce good results, the setting similar to the larger ones already mentioned, and the sprinkling of water to disseminate any scent or evidences suspicious.

But the most "likely" places are to be found under the following circumstances:—Every otter, or sometimes pair of otters, has a spot to which it resorts at least once a day, at which to deposit its excrement; this place is sometimes in the open and sometimes, but less often, adjacent to any places which might by their appearance denote to the presence of the animal lair. In order to discover this place, one must look about for deep holes in the river to which the fish, when pursued, are likely to swim to for probable safety, and having discovered a seeming one, further search must be made on the bank for evidence of the otter's visit, which may be apparent by two or three yards from the edge of the water of a small spot where the grass is uncommonly luxuriant, and which, on being parted, displays the animal's dropping, easily distinguished by a copious portion of fish bones. One must now, if possible, determine on the direction of the vermin's track from the water, occasionally very plain, at other times quite indiscernible. In the latter case a beginning may be made of forming one by working the foot backward and forward on the grass. Then, where the real or made track reaches the bank, carefully set one trap so that any otter trying to reach the bank may be taken, while several more must be placed round the knoll of grass, staking them to the earth and covering all carefully up, finally sprinkling water over the traps set and the track made.

Whenever a fish can be obtained, if caught by an otter is immaterial, it can be employed to advantage by being placed in a nicely conspicuous situation and enough gins "killed" about a foot or so from it to catch any otters lured by the smell. More particularly when put close to the water-edge is this movement most enticing, and a great number of the fish marauders can in time be taken. It is very often usual to substitute for the short chains, a long thin, or a wire-threaded cord, so that instead of trusting to the trap to hold any captive till one comes, it may reach the water, and swimming out drown itself.

We do not see that there is much further to be said regarding

otters and also how to catch them; if the latter portion has not been sufficiently clear to the uninitiated, we shall be only too pleased to give them all the information one can. Of course, some considerable insight into the habits of the otters is necessary, although what we give is the result of observation. A recommendation to prove this true should be acted on, and it will be found a valuable aid to those who desire to put a limit upon the depredations of *lutra*, by catching some and warning the others off through the discomfiture of their companions.

ERICA.

A FOREST TROUT STREAM.

HOW often when conning the pages of the FISHING GAZETTE have we indulged in a quiet smile at the enthusiasm displayed by some angler when writing up the incidents of a fishing trip: the lovely trout stream flowing through open meadows, or preserved park lands; of their daintily handling a favourite cast of flies; their freedom from care because there are no trees or shrubs to hang to when retrieving their casts; of the expressions of pleasure when they had killed a dozen trout.

To such gentlemen, I would like to introduce some of the hard work growing out of the fishing of an American Forest Trout Stream.

Can you imagine a stream, coming rushing, boiling, surging out of a dense forest, the brush and undergrowth forming the river banks, so interlaced that it is difficult to tell where the banks end and the water begins; it is a common expression with us, "The brush is as thick as the hair on a dog's back," and you must fight your way through it inch by inch. Hence we fish from boats, for it is impossible to wade this stream—the bottom is too treacherous.

We intended camping on the banks of this stream. So, on the eve of July 17th two friends stood on the deck of one of our fine lake steamers, with our camping material and fishing tackle around us; we saw everything stowed away, and secured our state room, then gave ourselves a vigorous fanning. It had been a fiercely hot day, the thermometer had touched 98° in the shade, we had seen limp and inanimate forms borne into the drug stores sun-stricken; we were glad to get away from the scorching city. As we steamed out into Lake Michigan, we hailed with delight the prospects of a cool, breezy ride, of nearly 400 miles.

The second day at noon found us camped beside our trout stream in a small clearing of the forest. After getting our camp arranged we decided to take a survey of the stream; so after dinner started up stream alone in a small boat. Before proceeding I must describe these boats as they form so important a part in our camp life. They are not punts, though flat-bottomed boats; they are about 12 ft. long, flare-sided, about 3 ft. beam amidships, running to a sharp stem and stern. They will row easily with oars, but for paddling they are perfection; they are very easily thrown off balance, and one unskilled in handling them will probably find himself dumped into the water, sans ceremony. Yet we have seen Indians handling them with nothing but an old blanket for a sail, and a paddle to steer with, and bring them through a boiling sea that made us hold our breath fearing they were all drowned, yet when they beached them close to where we stood, two squaws and some pickaninies bundled out of the boat without being damp, and not a quart of water in the boat.

In our boat we took a paddle and a good boat-hook to pole up stream, but we had underrated the strength of the current and misjudged our own strength. In the rapids we pushed and tugged, gaining only inch by inch, then only by getting out of the force of a six-mile current and pushing along the bank, but by hard work and sticking at it did we push through these rapids. Soon we found the river broadens out into a small lake, from

which rises some wild ducks and a big blue heron. We paddle across this forest gem, for this lake lies in an unbroken forest of grand old hemlocks, away even from the sound of the woodman's axe, pushing up into the quieter reaches of the river.

Here and there we came upon a swifter piece of water, or a series of ripples, at the foot of which lay a deep hole. Looking down we see many trout dart out of its depths as we silently paddle our boat over it; but we push on intent on reaching the upper portion of the river that now begins to narrow, and increases in strength. We are obliged to put forth all our muscle, and use our tact to keeping the boat heading up stream; once let it swing and get the advantage of us, and it will tip us into this icy cold water.

Almost every boat's length we see trout darting from the sunken logs and snags that lay along and across the river bottom; but we cannot fish; we have all we can do to hold our footing. We push on until the shadows begin to fall upon us in this quiet valley. Hidden under the lofty hill-tops, and the towering trees around us, there is not room for our boat to turn, so we hang on to a submerged log and take a breathing spell, charmed by all the beauties around us.

Everything on such a stream calls forth the admiration of one whose soul can enjoy all things beautiful. The hills clad to their tops with the primeval forest, every turn shows some new beauty in them. We let loose our hook, and quietly drift along down stream, happy and contented; our boat requires no effort on our part except an occasional swirl of the paddle to guide its course.

One can give themselves up to their sweetest musings while they float along; and as the sun sinks, the gloaming creeps into the dells and dingles, the shade of the monster trees add new charms to the varying landscape, toning down everything rugged and broken. The Boyne is just such a stream; to the lover of Nature it is ever charming; to the lover of the gentle art it commends itself by the numbers of speckled trout that can be taken from its cold waters.

While we have been thus drifting, the trout are continually breaking water as the evening flies flit over its surface, yet we cannot cast a fly, though well provided with a fly-book and a handsome eight-ounce Orvis greenheart rod. We cannot use them and handle the boat. Another thing, these trout are shy fellows.

The best way to take them is to use a bait and sinker, either worms, squirrel meat, or the ventral fin of a trout, cutting out a small piece of the belly and placing it on a hook, so that the fins spread out. We drop this bait alongside the first log we see on the bottom of the river, from which has washed away the sand, leaving holes that the trout hide in. Swish! something struck us; our little rod bends and the line sings, but we don't give an inch, if we do he is off for some sunken log; he knows them all; every piece of brush, every gnarled knotty stick of timber, every hole, better than you do. Try to bring him near you, and your line is fast while your boat is drifting down stream. Swish! and your leader comes back to you minus hook and bait, but handle him firmly, but gently, and as he weakens slip your landing net under him, and a beautiful marked trout of a pound weight lies in your creel.

Try this same plan lower down stream alongside any sunken log, and, by my faith, you will find as game fellows as you want to handle, and plenty of them too. Sometimes grayling can be caught in this stream, but they have become a rare fish; somehow it has come to be accepted as a fact that trout and grayling cannot live in the same stream, because the former are so aggressive.

Amongst the party we camped with were two men of large size and heavy weight, over six feet in height. One of them, a keen

sportsman and fisherman, but had never caught a trout. When we came into camp and showed our splendid basket of trout, they wanted to fish right away, and as there was yet some daylight, they took our boat. We cautioned them to handle it carefully, or it would damp them.

They paddled up to the foot of the rapids, about fifty yards above camp, while we watched them. The current was very swift and swung the boat, in spite of Bill's efforts to steady it. Captain cautiously rose to his feet, and dropped his baited hook down alongside a big log on the bottom of the river. There was a rush, a quick strike, a yell, as the boat canted, "I've got him," from captain.

"Steady there, Bill!"

"Golly, captain, don't lose him; I'll get the landing net."

Bill, in his hurry, tripped and stumbled over an old can in the bottom of the boat.

"Hold on, Bill, don't tip me over!"

The boat was too cranky for such gyrations as these. Bill, in his anxiety to reach the fish, threw the excited captain off his balance—in an instant he was up to his arm-pits sitting in the water, while Bill, convulsed with laughter, was doing some lofty acrobatic work in the vain endeavour to steady the boat; but, in his floundering, he lost his foot-hold, over he went up to his neck in water, in a hole a little below where the captain fell in.

In less time than it takes you to read this incident, captain was on his feet and reeling in his fish; taking him by the gills he climbed the bank just as Bill came splurging across the river. The rest of the party who were in camp ran when the captain took his tumble. When we got to them we found the two admiring their first grayling; while Bill exclaimed, "Say, captain, honest now, ain't it worth while getting a ducking to capture such prime fellows as these. After fishing for muddy cat-fish and suckers, sure enough this is first blood for the Hoosiers, for they have caught the first grayling in this party."

Such are some of the every-day experiences in fishing a fores trout stream.

W. DAVID TOMLIN.

Chicago, U.S.A., Jan. 1st., 1881

NOTICES OF BOOKS.

MESSRS. KEWELL AND SONS' NEW LIST OF FISHING TACKLE. It is more than 20 years since we first bought and used tackle made by Messrs. Kewell and Sons, of 197, St. John Street Road, London, E.C., and we can speak from long personal experience of the excellence and very moderate cost of their goods. Their new list contains some useful information in addition to its business contents, and we think every angler ought to have it. Mr. C. Kewell is himself a first-class angler, and, of course, that enables him not only to supply the proper thing, but to advise a beginner in any branch of angling as to what will suit him best. The eel-fishing season is coming on and we hope our readers will remember the capital arrangement of eel hooks, for use with lobworms, which was originally made for Mr. W. J. Carter, which Messrs. Kewell now sell large numbers of.

JACOB'S LADDER. By Barbara Wordsworth. London: Wyman and Sons.

It is rarely that a book of short stories is successful, but we sincerely hope this volume will be. It is a most charming little work and fully deserves the high praise which was bestowed on it by the *Academy* last week. The music, poems, and stories are all much above the average, and if any of our readers want a pleasant, pure book as a present for a daughter, we can recommend this.

IMPROVED "GARNET" QUILL MINNOWS.

MR. WILLIAM ATKINSON, of 8, All Hallows Lane, Kendal, writes to us:—"Seeing you have a notice of the 'Garnet' Quill Minnow in your last, I have great pleasure in sending you some samples of my improved quill, which I hope will meet with your approbation."

The specimens sent are very nicely made, and we like the colouring better than in the old ones. We need say nothing more in praise of this deadly bait, except that it should be used on a fine stained trace, and with three swivels, and spun down stream.

CORRESPONDENCE.

[We do not hold ourselves responsible for opinions expressed by our Correspondents.]

IDENTIFICATION OF RARE FISH.

SIR,—As an old co-worker of our late lamented friend, Mr. Frank Buckland, I should be pleased to do anything to assist any of your readers in my district in identifying any rare fish and reporting upon them to your paper.

I have already a nucleus of a fish museum, and hope some day to be able to present it to the public should one be started in Plymouth. Among my collection I have a cast of a mackerel, the largest on record, which weighed, when caught, nearly $4\frac{1}{2}$ lb. The specimens should be carefully packed, if possible in ice, and forwarded by the quickest route, carriage paid, to—Yours truly, 195, Union Street, Plymouth. WILLIAM HEARDER, F.L.S., F.S.A.

THE LARKHALL ANGLING SOCIETY.

SIR,—Among the "club reports" in your issue of February 12th, there appears one purporting to come from our society, and signed W. H. Dabchick. Again, in last Saturday's GAZETTE, under the same heading, signed "H. W.," merely the previous initials transposed, and the "Dabchick" flown. These reports (so called) do not represent the doings of the society, and are nothing more than bad examples of "ink slinging," and as such likely to mislead members and friends at a distance.

The first notice—that of February 12th—can be passed over as an abortive attempt at jocularity; but the second—that of last Saturday—contains a statement that must not go uncontradicted, as it casts a slur upon those gentlemen who were elected that evening, viz., Wednesday last.

There were three gentlemen up for election that night, viz., Messrs. A. Piolaine, J. Kearns and W. H. Green, as honorary members, and, I am happy to say, that instead of there being any black balls, those gentlemen were elected unanimously.

The committee have endeavoured to find out the source of these reports, and their enquiries show that they have not emanated from any member of the club; therefore I have the authority of the "executive" in asking you not to receive and print any account of our doings at our "club house," except those sent by myself, the authorised reporter of the society. Trusting you will kindly insert this *in extenso*, I am, &c., VERITAS.

Larkhall Angling Society, Feb. 28th, 1881.

"GENTLEMEN POACHERS."

SIR,—Under this heading, "Fair Play," in your paper of the 26th, complains of "three occupants of a boat" using a cast net in the River Wensum; but he does not say they were gentlemen (notwithstanding the above title), neither does he state his case with sufficient particulars to enable any one to tell him whether the fishing was legal or not.

How much more practical it would have been if, instead of troubling you on the subject, "Fair Play," had enrolled himself a member of the Yare (Wensum) Preservation Society, and, by his subscription, assist in preventing illegal practices on the river. He would then be entitled to a copy of the bye-laws, and thus be enabled to answer the question himself.—I am,

EDWARD FIELD, Hon. Sec., under Norfolk and Suffolk Fisheries' Act.

Ipswich, Feb. 28, 1881.

P.S.—Can you believe it, Mr. Editor? Neither of those gentlemen who last year wrote so strongly about subscribing, has sent us one penny.

TROUT FLIES.

SIR,—Like yourself, I am an old fisherman—having commenced nearly forty years ago. With regard to the number of flies to be used—while, on the one hand, I cannot agree with Mr. Pennell, that three artificial flies, or non-descripts, are sufficient for all purposes; on the other hand, I believe that very many anglers carry more flies in their books than there is any occasion for. Certainly green, brown and yellow are not sufficient for me, as I generally take my best fish with a white moth towards evening. I think that the happy mean is the right thing in this respect, as in many others. I generally carry about thirty kinds of flies in my book, but scarcely ever use more than a dozen, and get as good sport as men who use a much larger assortment. My favourites are:—"Red spinner" (two sizes), "March brown," "red palmer," "blue dun," "coachman," "May fly," "black gnat," "white moth," "oak," "sedge," "Coch a Bondhu," and one or two others. And the best general fly for all times and seasons I have found to be

RED PALMER.

ANGLING CLUBS NEAR LIVERPOOL OR BIRKENHEAD.

SIR,—Will some of your Liverpool or Birkenhead readers kindly furnish me with the names and addresses of any clubs in the above places, and much oblige—Yours, &c., BIRKENHEAD.

[Thanks for the suggestion.—ED.]

GOOD COARSE FISHING WANTED,

SIR,—As an old subscriber I venture to trouble you. I am advertising for some really good coarse fishing (with residence attached, if possible), and thought perhaps you would be willing to assist me by putting a little query to your subscribers in some corner of your paper, as probably some of them may have what I want. I am not particular as to rent, so long as I can expect really good sport.—I am, &c., JAMES PURDEY.

314 $\frac{1}{2}$, Oxford Street, London, 1st March, 1881.

CURIOUS FISHES.

SIR,—I beg your pardon, and shall swerve for once a degree from my old rut—that of brevity. On Friday last, happening to drop in, at the intimation of young Tomkins, at Mrs. French's, of 109, King Street, I was pleased to see some fish that are of unfrequent occurrence, at least on *terra firma*. Two lump fish (*Cyclopterus Lumpus*), one of which, a good specimen, covered the tape at $2\frac{3}{4}$ inches, lay on the slab. This thick ugly fish fell but half an inch of the standard size. It swims edgeways. Its dingy-coloured back and sides are rough, and covered with several rows of bony knobs. By means of the "sucking apparatus on its belly it can fix itself to various substances. Goldsmith says, "If flung into a pail of water it will stick so close to the bottom that on taking the fish by the tail, one may lift up pail and all, though it holds several gallons of water." Its flesh is flabby and insipid, though, as an old book asserts, "It is white, and tastes like salmon, and if pains were taken in the dressing might be made a delicacy." Greenlanders and seals—whose habits and tastes are much akin—alike esteem this fish a delicacy; the former making a grand dish of the roe—rather than they than me.

Mrs. French showed me also a specimen of the wolf-fish (*Anarichas Lupus*), sometimes termed sea-wolf, but by 95 per cent. of our seafaring friends the *cat-fish*. From a side view of its head, and the canine-looking teeth, it has a decidedly Old Tom look. It is one of the few fishes provided with fore teeth and grinders, and "these are so strong," relates the book above-mentioned, "that if it seize on an anchor it will leave the marks of them on it." What provocation the anchor gives to merit such revenge I am not informed. Then woe to the legs of such unlucky bather as Master Lupus may seek to nibble. Inhabiting the Northern Ocean it attains to about fifteen feet in length, but British-caught specimens seldom exceed seven feet. The above fish measured thirty-six inches, with teeth half-an-inch out of its jaw. Mrs. French had one just five feet long a day or so previously. From its shape I judge it swims slowly and with undulating motion. Greenlanders—those epicures—enjoy its flesh (so they would soaked leather), and it certainly does look eatable, although from the small of the head of one I boiled to get its jaws I could not stomach it. Feeding, as it does, on shellfish, it finds those much easier to masticate than welded anchor.—I am, &c. ARTHUR PATERSON.

Great Yarmouth.

FOSTER FUND.

SIR,—I have great pleasure in announcing the receipt of one guinea from the Royal George A.S.; also 6s. 6d. from the members of the Kenningtonian A.S.—I am, &c., J. HOOLE, hon. sec.

March 2, 1881.

CLUB REPORTS.

ANCHOR AND HOPE ANGLING SOCIETY.

A match will take place at Ware on Sunday, March 6th, for Mr. Ball's prize and three club prizes. A. SHAKEL.

Feb. 28.

AMICABLE BROTHERS ANGLING SOCIETY.

A great many of the members tried their luck last Sunday, but only three succeeded in getting fish. Mr. Say, one jack, from Pulborough, 3 lb. 2 oz.; Mr. A. Plumstead, 2 lb. roach, and Mr. T. Larkman, 2 lb. 9 oz., from the river Lea. Mr. A. Plumstead won Mr. Patrick's prize for the first heaviest weight of roach during the month; Mr. Larkman winning Mr. Berry's prize for the second heaviest.—J. WORLEDGE.

Feb. 28.

AMICABLE WALTONIANS.

The takes of fish at this society have not been very large of late. On the 20th Mr. Jacks had a jack weighing 5 lb.; Messrs. Embleton and Rix, roach from the Lea. On the 27th ult. the members fished for a timepiece, Mr. Embleton proved the winner, with roach from the Lea. The next general return visit takes place at this society on Tuesday, March 8.—C. IRWIN.

BATTERSEA PISCATORIAL SOCIETY.

Several members of this society were out on Monday last for the purpose of competing for two prizes given by Messrs. Ash and Knox. The following are the names and weights: Mr. Newman, $5\frac{1}{2}$ lb. dace and roach from Twickenham; Mr. Willoughby, $4\frac{1}{2}$ lb. roach and dace from Kempton Park; Mr. Hawkins, 4 lb. roach from Kempton Park; Mr. R. Banfield, 2 lb. 15 oz. roach from Woking; Mr. R. A. Banfield, 2 lb. 3 oz. dace from Richmond. On Sunday next two more prizes will be fished for, the donors being Messrs. R. Banfield and myself.—NEWMAN, hon. sec.

THE BERMONDSEY BROTHERS.

The Bermondsey Brothers fished for three prizes at Rye House on Sunday last, but only the first was won, the winner being Mr. Court with a 2 lb. jack.—W. ALLEN, sec.

March 2.

BOSTONIAN ANGLING SOCIETY.

The Bostonians were well to the fore on Sunday last, Messrs. Jennings and Goodge having a good take of roach and perch from the Thames; Mr. Hurt a nice lot of handsome perch from King's Langley.—H. TAYLOR.

CLAPHAM JUNCTION ANGLING CLUB.

Several of the members were out on Sunday last and met with the following success:—Mr. E. Withers, fishing at Shepperton, took three nice barbel, weighing 6 lb. 4½ oz.; roach and dace, 4 lb. 5½ oz. Mr. Maslin, from Datchet, roach, dace, and chub—a very nice take. Other members weigh-in, but their takes were small. Members are requested to attend on Thursday next for important business. Members wishing to compete for the remaining prizes must apply to the secretary at once, or not later than Thursday, March 10.—E. WILSON, sec.

DUKE OF CORNWALL ANGLING CLUB.

The return visit of the above will take place on Monday, March 7th, when they will be pleased to see a good representation of other clubs attend. Several members have been out, and have met with a little sport. Mr. Patching bringing home from Blunham 13 lb. roach, A. Clark jack. Messrs. W. Sargent, B. Sargent, H. Baker, and W. Hyde, had a nice show of roach and jack from King's Langley. A peg-down match will take place at King's Langley on Sunday.—A. CLARK, sec.

DUKE OF CONNAUGHT ANGLING SOCIETY.

The next return visit (No. 1, W. C. A. list), will take place at the club house, Monday, March 7th, the club house being the Duke of Cornwall, Lis-more Circus, Haverstock Hill, which is easily reached by N. L. trains to Gospel Oak, Midland trains to Haverstock Hill, King's Cross trains, or 'busses from the West-end, any of these conveyances bringing visitors within two minutes' walk of the club-house. The Cornwall anglers will be proud to see representatives of any society not on the list mentioned, and can promise them an enjoyable evening. Amongst their members, Mr. Patching, during the past week having 15 lb. of splendid roach and chub. Messrs. Galloway and Clark (sec.), a capital take of jack, making together 54 lb., which, considering the state of the water, is very creditable.

Feb. 28, 1881.

EUSTONIAN ANGLING SOCIETY.

Several of the members of the above society was out on Sunday last, but did not get any fish, Mr. Hornfeck alone saving us a blank with some very nice roach and dace from West Drayton.—WM. COSTER.

GOLDEN TENCH ANGLING CLUB.

On Sunday evening last, again the old complaint was heard, it is all rough wind and snow, enough to blind you, and the water travelling like a racehorse. Our members all out but came home all blank, till the arrival of Mr. Webb. With his perseverance and luck, he had 3 nice jack from the old shop, St. Margarets, the weight 14 lb. 11 oz., the largest fish 6 lb. 9 oz.—T. S. WEBB.

Feb. 28, 1881.

LARKHALL ANGLERS.

There was another musical evening in connection with this society in the club room, the Larkhall, Larkhall Lane, Clapham, on Wednesday evening last, and the room, which is a good-sized one, was filled to an overflow. Since the introduction of Mr. G. F. Spencer to the presidential chair he has, by great energy and perseverance, raised the society to a much larger position, and almost every meeting night new members are enrolled. If the club goes on, as it does now, increasing in numbers and attendance, the worthy host, Mr. Morris, who is its capital treasurer, will find it necessary to extend the accommodation, and this was evidently the feeling on Wednesday evening last, when the members and visitors had to be packed as closely together as possible. It was very little after eight o'clock when Mr. G. F. Spencer took possession of the chair, with Mr. W. Tucker, the hard-working secretary, on his right, and Mr. W. H. Brougham, of the Thames Angling Preservation Society, who had been specially invited, on his left. The minutes, which were carefully kept, being read over and confirmed, the records of the week's weighing-in of fish was given, but owing to the unfavourable weather they only consisted of a few dace and roach out of the tidal waters. Mr. Tucker then gave notice of the annual dinner, which is to take place at Moufflet's Hotel, Newgate Street, on Tuesday, March 22, and there can be no doubt the muster on this occasion will be one of the largest the society has had, as so many of the members are desirous of evidencing their high appreciation of Mr. Spencer's valuable services. Several new members were proposed for election, and then after the distribution of a highly perfumed and nicely got up musical programme, the Chairman declared the termination of business, and proceeded to commence with the harmony to which the remainder of the evening was to be specially devoted. The commencement was made by a selection on the pianoforte by Mr. Hallé, of the Royal Aquarium, Westminster, which was most brilliantly executed by the talented artist, and then Mr. G. F. Spencer, as "Director of the Musical Arrangements," with a host of talent to select from, proceeded in rapid succession with the vocal part of the entertainment, which it would be difficult to detail in order to give due justice to all who took a position in it. There was something to please and amuse everybody—both comic and sentimental. In the former Mr. T. Sylvester, in a burlesque scena, greatly distinguished himself and afforded intense amusement. Mr. Fred Howe, with the banjo accompaniment, was deservedly encored in a parody on "Won't you buy my pretty flowers?" whilst Mr. A. Glover took the room by storm in his splendid rendering of "The Lighthouse Light," which was loudly redemanded, the star vocalist substituting another song. Mr. W. Spencer admirably recited "Christmas Day in the Workhouse," his powers of elocution being exceedingly good. Mr. W. Gordon Lawrie, in a humorous song of "Schneider how you vas," was warmly encored. In simply mentioning the names of the other vocalists it is not intended as any disparagement, as all did their parts so well, and all were entitled to great praise. These were Messrs. F. Crontel, A. L. Burgess, J. Edmondson, A. Kennedy, R. Edmondson, C. Broadlake, G. Moore, E. M. Mallett, P. Fitzgerald, Hal Hamilton, Launcelot Green, Creak, C. Broadlake, J. Lovett, &c., &c. A hearty vote of thanks was accorded to Mr. W. H. Brougham for his attendance on that occasion, which was briefly acknowledged, so as not to interfere with the harmony; and on leaving the room his departure was the signal for musical honours, which were most heartily given. Up to the closing hour there was no cessation in the musical element, all were kept by the Chairman's scientific ruling in perfect humour, and if there

was a regret at all, it was that the evening had so quickly gone, and the joyous proceedings had come to a termination. Several of those present signified their intention of supporting the popular chairman, Mr. G. F. Spencer, at the annual dinner, and there can be no possible doubt that Mr. B. Boyce, the worthy proprietor of Moufflet's Hotel, who is a member of the club, and who was present on this occasion, will do his part in making the banquet of an important and appropriate character. Mr. Tucker announced that Mr. W. H. Brougham, Mr. P. Geen, and others had promised to be present. The last "charge of the glasses" was a bumper to Mr. G. F. Spencer, and an unmistakable vote of thanks for his valuable duties as president.

THE LITTLE INDEPENDENT ANGLING SOCIETY.

We had a nice little show of fish on Sunday evening, the following members weighing in:—Mr. Humphreys, 5 lb. perch, one weighing 1½ lb., and 12 oz. roach; Mr. Hurgood, 5 lb. 8 oz.; Mr. Scott, 13 oz.; Mr. Mead, 11 oz. roach; Mr. Wills, dace, and Mr. Petrie roach and dace. To-day Mr. P. Banfield weighed-in a pretty jack 2 lb. 7 oz. On the last Sunday of the season we have a series of six prizes to be fished for—first, a silver cup, and the other five are money prizes. Only roach, and no private waters.—WM. BROWN, hon. sec.

March 2.

NORWICH ANGLING CLUB.

A piking match by the members of this club was held on Ranworth Broad (by the kind permission of Gurney Buxton, Esq.) on Wednesday, the 23rd inst. Fourteen members entered their names, and on the morning of the match twelve put in an appearance at Mr. C. J. Green's, London Street, whence the party were conveyed by bus (supplied by the Norwich Omnibus Company) to Ranworth Maltsters. The match commenced shortly after ten. The weather was dull, but fine, and for some time no fish seemed on the move, but later on some good fish were taken, principally by live bait. The prizes were won by the following gentlemen:—1st, Mr. R. Moll (hon. secretary), 24½ lb.; 2nd, Mr. W. Provart, 18½ lb.; 3rd, Mr. C. J. Greene, 11½ lb.; 4th, Mr. Hosken, 11 lb. Most of the other gentlemen had fish, and, altogether, considering the late bad weather, the outing was a success.

THE NORWICH PISCATORIAL SOCIETY.

The general meeting of the above society took place on Tuesday evening, March 1, at the club house, the Walnut Tree Shades. Mr. Harvey read a very interesting paper upon "Sport in America." Other important matters were discussed, and a very pleasant evening was passed. I will send you a detailed account next week.—ANGLER.

March 2, 1881.

THE PECKHAM BROTHERS.

On the 27th several members of the above ventured out to try and coax the finny tribe out of their natural element. Mr. Minard succeeded in getting some roach from his favourite resort, and thus saved the society from a blank. On March the 6th and the following Sunday a consolation competition will take place for the benefit of those members who have not taken a prize during the season. This society is open to receive a few more members to make up its full number, which is limited to 40. It has already over 30 names on the books, and bids fair to have its complement by the beginning of the next season.

March 2.

PIXIE.

PISCATORIAL SOCIETY.

There was a good muster of members at the club on Monday evening, Mr. Sach in the chair. Dr. Brunton put in an appearance later in the evening. Being the last day according to the club rules for weighing-in perch and pike, there was a very fair show. Mr. J. Ross Faulkner weighed-in 2 perch, 1 lb. 6 oz. and 1 lb. 1 oz. each, also 4 roach, weighing 2 lb.; Mr. Huggett, 2 chub, 2 lb. 15 oz.; Mr. Knetchli, 5 pike, weighing 27 lb. 7 oz., the largest fish, 12 lb. 3 oz.; Mr. Jardine, 5 pike, weighing 33 lb. 3 oz., the largest fish, 10 lb. 5 oz.—MEMBER.

March 2, 1881.

RICHMOND PISCATORIAL SOCIETY.

The weekly meeting of this society at the Station Hotel, on Wednesday evening last, was made very attractive by the introduction of the musical element, which brought together, in spite of the most unfavourable weather, a goodly attendance of members and visitors, the latter having been invited by Mr. F. C. Clench, who now usually presides over the weekly gatherings. Since the introduction of Mr. F. C. Clench, a member of the Thames Angling Preservation Society, Mr. Davis, of the London Piscatorial Society, who has now taken up his residence at Richmond, and several others, the Richmond Piscatorial Society is being made to occupy a most useful and active position, and the weekly meetings are much more largely attended. The chair was occupied on Wednesday last by Mr. F. C. Clench, who was supported by Messrs. W. H. Brougham, (T.A.P.S.) Mr. H. G. Penney, and other members of the Ham-mersmith United Angling Club, Cook (Mortlake), T. Abbott, Davis, Mattress, Dickenson, Rowe, Gaynor, J. Munro, Little, Trinder, Johnson, Houghton, B. Scrutton, Guido, J. H. Gaunt, (hon. sec.), &c., &c. An example was shown to other angling clubs by Mr. F. C. Clench taking the chair precisely at eight o'clock, the time fixed for the commencement of the weekly meetings, as a want of punctuality in this respect is always detrimental to a good and regular attendance. After a few practical observations from the chairman, and the confirmation of the previous minutes, the harmony at once commenced, and was kept up throughout the evening with lively interest. Mr. Guido greatly distinguishing himself in the rendering of a selection of old English ballads, which ended with a verse from the "Death of Nelson." Mr. Guido is gifted with a rich musical voice, which he uses to great advantage, and accompanies his singing on the guitar, which he plays in a masterly style. Mr. H. G. Penney also sang with good taste, and altogether the musical proceedings were most effective. In the course of the evening Mr. F. C. Clench, in a complimentary speech, proposed "Success to the Thames Angling Society," coupling with it the name of Mr. W. H. Brougham, who had given them the pleasure of his company on that occasion. Mr. W. H. Brougham, in his response, thanked those present most heartily for their warm reception, and assured them it was the object of his society to do everything that could be done to preserve the fishery for the benefit of all classes of Thames anglers. In conclusion, he wished the Richmond Piscatorial Society every success, and he was sure with so excellent a chairman as Mr. Clench, it would rise to great prosperity. There are

few angling clubs that possess a club room so exquisitely furnished, and where there is so much comfort as the one at the Station Hotel; and in addition to this, the proprietor, Mr. J. Munro, who is also a member of the society, is unremitting in his attention to all. The "creature comforts" are of the best kind, and all orders are attended to in the most satisfactory manner.

THE ROYAL PISCATORIALS.

All those jack fishers who missed visiting this society on the 27th, I must say, lost sight of one of the finest and largest shows of jack taken by one man with rod and line this season, considering the conditions the different rivers have been in since the middle of January. Among those gentlemen who availed themselves of the opportunity I recognised several well-known anglers, including Mr. G. Lee, Mr. F. Dale, Mr. W. Brown, R. Cain, Mr. Boalch, Mr. Beckett, and that never-to-be-forgotten gentleman, Mr. William Randal, and many others, all of whom, on entering the club-room, uttered a half-whistle sort of sound, and adjectives both high, soft, and low were heard in praise of the fish set out in four trays on the table, containing as follows:—Two trays with three fish each, weighing from 9 to 10 lb. each fish, and two trays, four in each, weighing from 3 to 6 lb. each, the gross weight reaching nearly 90 lb. This added to 50 lb. that was exhibited on Thursday evening, the 23rd, made a total of 140 lb. to the credit of Mr. T. Hughes for the week ending Feb. 26, 1881. On March the 6th the members will compete for three valuable prizes, conditions being "Go where, and fish how, you like, according to club rules." Gentlemen taking an interest in angling, and admiring piscatorial triumphs, should pay a visit to this society, which is still held at the Albion, Rodney-road, Walworth, on Thursday and Sunday evenings, and I am quite sure Mr. T. Hughes, or, in event of his absence, Mr. King, will be happy to show them the trophies that decorate the walls of the club-room, which consist of some very handsome jack, weighing from 17 to 20 lb., and a large collection of roach, perch, dace, bream, trout, grayling; also that which is not found in every club collection, a pike perch and a crocodile. In addition to all these, now and then may be heard and seen a "fairy tale" and a
March 2. "PIXIE."

ST. JOHN'S ANGLING SOCIETY.

On the 26th, our show of fish was small in number and size, Mr. Hunt being the only member to show fish; being jack and perch from St. Margaret's. Members will please take notice that a special general meeting will take place on Friday, March 4th, to settle about the prizes not yet won. I beg to state that we take a complimentary visit on Monday, March 7th, to give our new host, Mr. Gill, of the Three Compasses, Cow Cross Street, a bumper. We have two rooms to put you in, so don't be afraid to come in numbers. The club house is within 30 yards of Farringdon Street station.—F. THORLING.
March 1.

SURREY PISCATORIALS.

On the 3rd Dr. Carpenter, president of this society, exhibited some nice jack and perch, the largest among the former weighing between 10 and 11 lb., and the latter nearly 2 lb. The rules revising committee sat on Tuesday evening for nearly three hours, and succeeded in getting through the best part of their work, which will be placed before the members for their approval at the at the general meeting (to which all members are summoned to attend) to be held on March 17.—PIXIE.
March 3.

THE TRENT (WESTMORELAND) ANGLING ASSOCIATION.

The annual statement of accounts of this association was issued at the commencement of the week. This year it is more interesting than usual to peruse from the fact that it shows in a measure how anglers have received the arrangement made by the conservators enforcing a license for trout. The past season was the first in which trout became subject to the bye laws giving them protection similar to that accorded to salmon. It was thought at the time the trout licence was enforced that it would have considerable effect upon the funds of the local angling association, and such has proved to be the case, although the falling off in the number of members in the Kent society may be ascribed in part to the unusually bad season. There were many occasional anglers who never threw a line during the whole year, and they, perhaps, only obtaining their association ticket the day before they intended to fish, never took one at all. The members and adults' subscriptions during the past year was about 120 against something like 180 in the previous one. This is a great falling away indeed, and may be taken into consideration by societies similar to that which looks after the Kent when trout licenses for their districts are talked about. Then, again, a number of subscribers who, prior to the advent of the trout licence paid more than the minimum subscription of 2s. 6d. have reduced their payment to that sum. The "professionals" have mostly done this. From the above it will be seen that the Kent Angling Association cannot be in the most flourishing condition. The subscriptions amounted in 1880, to only £23 5s., including 97 subscribers of 2s. 6d. each, 12 of 5s. each, the remainder varying from 21s. each downwards. The Association, however, acts in conjunction with the Fishing Conservators, who appoint a watcher or watchers jointly, the Board contributing £40 thereto. The annual meeting of the association was held on Tuesday evening. There was a good attendance of members, but the business transacted was only of local interest. Angling should have commenced on Wednesday, but, unfortunately, we have had a return of the winter, and all around is white. Indeed, on the lake, mountains, and on the hills where the Kent and our streams here have to rise, the snow must lie to the depth of a foot or more, even where it has not drifted. Some very heavy falls of snow took place on Saturday and Sunday. By-the-bye, in your note last week on the quill minnow you say it was invented by Robert Garnett. It was invented by James Garnett, an elder brother—now, unfortunately, deceased—of the man you mention. An otter was trapped not far from Kendal one day last week.—SPRINT.

WALTHAMSTOW ANGLING SOCIETY.

The undermentioned members of the above society have had the following catches: From Norwich, on Feb. 18, Mr. Casey, 34½ lb. roach; from Alresford,

Feb. 25th, 3 jack, 25 lb., 1 carp, 5 lb. From Alresford, Feb. 25th, Mr. Howell, 2 carp, 10 lb.—G. A. sec. *pro tem*.
Feb. 26, 1881.

WALTONIANS.

Many of our members were out with one exception. The lakes were very muddling. Mr. Phillips, one of our most successful members at all times, had a magnificent show from Henley of 18 lb. 13 oz., including a fine perch of 2 lb. 1½ oz. Mr. Malcolm came next with 2 lb. 5½ oz. roach, Mr. Parkman, our worthy secretary, next, with 1 lb. 6 oz. ditto; Messrs. Roland, Rushbrook and Good also weighed in fish.—A. J. MARRIOT.

Feb. 27th.

WALWORTH WALTONIANS.

On Friday, the 25th, Mr. Boalch visited Richmond, and succeeded in getting some nice dace, which, on being placed in the scales in the evening, were all alive and a-kicking, and required some hard knocks to keep them quiet. It was proposed the same evening that a competition take place on March the 4th for five prizes, one of which is a very handsome walnut writing-desk, nicely filled up, given by Mr. W. Brown. Condition of competition: Go where, and fish how, you like, all fish to weigh according to club rules.—PIXIE.

March 2.

Since writing my last report for this society I have discovered that I have made a mistake in the date of the next competition. It should be March the 6th, and not March the 4th as previously stated. By correcting this you will greatly oblige.—PIXIE.

March 3.

REBECCA AND HER DAUGHTERS.—At a large meeting of magistrates and others interested in the amendment of the salmon fishery laws and the prevention of poaching and rioting, held at Rhayader on Tuesday night, resolutions were carried to the effect that stop-nets should be increased in mesh, that no spearing should be allowed except under certain restrictions, and that samlets should be taken by rod and line. It was also resolved to call the attention of the Government to the pollution of rivers by mines, and a deputation was appointed to wait on the Home Secretary with the view of bringing the resolutions to the notice of the authorities.

TROUT FOR THE THAMES.—Last Tuesday the stock of trout in the Thames was increased by 100 fine fish of the celebrated Wycombe breed, varying in weight from ¼ lb. to 2½ lb., at the expense of the Reading and District Angling Association. The finding of good quarters for the fish was a matter of considerable difficulty—owing to the floods—to Col. Heathcote and the hon. sec. (Mr. A. C. Butler), by whom they were "turned in," but eventually suitable homes were found for all.

SEAKALE, grown in the open air, was cut in the gardens of Tresco Abbey, Islands of Scilly, on Monday.—*Cornishman*.

THE potato-crop (out-of-doors) of the Scilly Islands is reported by the *Cornishman* to be again damaged by frost.

THE brocoli crop of West Cornwall, according to the *Cornishman*, has been further damaged by frost within the last few days.

THE planting of the early potato is being generally carried on in the neighbourhood of Penzance; while the sheltered spots on Mousehole Cliff, the *Cornishman* says, show the potatoes peeping out of the ground.

SIR JOHN ST. AUBYN, Bart., the senior M.P. for West Cornwall, has had an interview with a deputation of Mount's Bay fishermen, who (says the *Cornishman*) express their approval of the new regulations for fishing-boats' lights.

THE Mount's Bay fishing-boats, not being very successful at Plymouth, are returning home, and are in search of mackerel at the very mouth of the Channel. The *Cornishman* reports light catches—only 600 or 700 fish between 20 boats—at 52s. to 57s. per hundred, and nets damaged by passing vessels.

ANGLERS should always be provided with something to take away the swelling and poisonous effect of the bites of insects. They should also have with them something to apply to a cut or sprain. Pond's Extract reduces the swelling and inflammation, stops bleeding and pain, and hastens the healing process in case of any wound or sprain; and it has no equal for application to the bites and stings of insects. Therefore never go on a fishing excursion unprovided with a bottle of Pond's Extract. It is for sale at all chemists, at 2s. 3d., 4s. 6d., and 8s. 6d. per bottle.—[ADVERTISEMENT.]

TIRED HANDS AND ARMS.—Edson's Electric Armlets and Wrist Bands. Invaluable for anglers and gun sportsmen and highly recommended for all persons having tiresome writing, sewing, or music practice. They give wonderful energy and strength, enabling the wearer to accomplish tedious work with steadiness and comfort. Price 2s. 6d. per pair, silk web and fine steel clasps. Sent to any address on receipt of P.O.O. payable to J. Edson, the Electric Fabric Co. Patentees, No. 1, Charlotte Street, Bedford Square, London W.C.—[ADVT.]

GREGORY'S SPINNING BAITS.—"The Gregory," the "Flexible Cleopatra," the "Oxford," and the "Colorado," pronounced by all Anglers and the Press the best baits invented for salmon, trout, pike, and perch. To be obtained from all respectable fishing-tackle shops in the world, and wholesale from Messrs. S. Allcock and Co., Standard Works, Redditch. Flattering testimonials speaking of the efficiency of the baits have been received from the Right Hon. John Bright, M.P.; Mr. William Bailey, Nottingham; the Rev. E. C. Holt, Teddington; Sir William Calder, Kingston-on-Thames, &c. Gregory's registered Archimedean spinning tackle for pike and trout, now ready, is pronounced by the press the best ever invented. For use with dead bait. The tackle is complete in every respect, and can be adjusted to suit bait of any size. Has been tried with remarkable success.—See that the name "Gregory" is impressed on the Archimedean fins, as inferior imitations are offered for sale, and people are thereby disappointed and deceived. Address, James Gregory, Vyse-street, Birmingham.—[ADVT.]

GEORGE JAMES EATON, of Starkholmes Matlock-Bath, Derbyshire, respectfully invites Noblemen and Gentlemen to try his standard FLIES for the present season. No flies sent or made up but what he himself has proved sure killers. A trial is all that is required from gentlemen who can fish to prove whether they may be genuine or not. Patronised by some of the best fishermen of the day. All flies dressed on the best Bandal hooks. Prices: Point Flies, 2s. 6d. per Dozen; Dropper Flies, 2s. per Dozen. Orders punctually attended to.—[ADVT.]

NOTICE.

Communications relating to the Literary Department, Fishing Tackle for Notice, Books for Review, &c., must be addressed to the Editor of THE FISHING GAZETTE, No. 12, *Fetter Lane, London, E.C.* and should reach the office not later than Tuesday morning.

Contributions are solicited, but the Editor will not undertake to return rejected MSS., unless accompanied with a stamped addressed envelope.

Correspondents are requested to write on one side of the paper only and give their real names and addresses, not necessarily as signatures to their letters, but as a guarantee of good faith. Unless this rule be adhered to no notice will be taken of such communications.

THE FISHING GAZETTE is published every Saturday, and can be obtained at Messrs. W. H. Smith and Son's Railway Bookstalls, and of the following, amongst other Fishing Tackle Dealers in London and the Provinces:—

Messrs. Alfred and Son, Moorgate-street.
Messrs. Price and Co., 8, Seymour-street, Euston-square, N.W.
Messrs. Williams and Co., Great Queen-street.
Messrs. Gee and Co., St. Andrew's-street, St. Martin's-lane.
Messrs. Gee and Co., Gray's Inn-lane (near Holborn end).

SATURDAY, MARCH 12, 1881.

OTTERS AND HOW TO CATCH THEM.—II.

(By an oversight, Paper No. III. appeared last week instead of this one, No. II.—Ed.)

THERE is no animal probably more diverse as far as its haunts are concerned than the otter, some apparently being inclined towards an extent of river so different in character to

that chosen by others, that to find several individuals living in complacent ease under circumstances so essentially contrary in their natural features, appears almost to be an exceptional case than the rule. Some of these vermin of the water find still running shallows, and gently falling stickles, more to their taste than dark eddying pools and rushing rapids, which may be more conducive to the pleasure of life of others of their kind; and although the generally extensive course of streams to which one or certain otters confine themselves, may exemplify many, to some extent, oppositely natured features of a trout or salmon stream, after careful observations it will be apparent enough that where one rather undefined boundary is situate, that there is difference, whether in the rate of the current, in the depth of the water, or the ruggedness of its course, be the inequalities at the sides or on the bottom of the stream. At any rate, each otter has a recognised limit to the distance it goes in search of its food and pleasure; and although sometime this distance is very great, still it has a limit which is duly observed by the animal, and which under ordinary circumstances it never goes beyond, and devotes its by no means welcome attention to the fish which frequent the particular extent of water which it haunts. Any one who has been present at a meet of any of the well known packs of otter-hounds, now so largely patronised, and who has taken part in the proceedings up to the death of the otter, must have been surprised at the great length of river passed and repassed by the animal, between the place where it evidently enters the water for the first time, and the particular spot where the fresh trail is first hit off, the interval of foil fallowed between these points being the extent of the otter's movements in search of its morning meal, and the exercise of those gambols with which it proceeded and supplemented.

Although this animal displays a considerable amount of sagacious instinct in the choice of site for its burrow, it does not form a lair of any great strategical value, being chiefly adapted to secure a quick and easy, but well concealed retreat into that element to which it mostly trusts when danger menaces. The lair is sometimes burrowed out, sometimes formed by enlarging or adapting to its own ideas of what is suitable any natural hollows which may exist in the pond or river banks, more especially, in the latter case, where any crevices among rocks, or similar places, are apparently of good repute in the otter mind as congenial dwellings. Where the otter burrows, it always forms the entrance to its lair beneath the surface of the water, works upwards in an indirect line, towards the top of the ground; forming sometimes several chambers of successively increasing height, so that it may lie dry—a necessity of first importance. Thus, during times when the water is high in the river, the otter will often be lying just beneath the surface of the ground on the banks of the stream; while, when the contrary is the state of the river, it may be in a hole many feet below. When the otter burrows, which we are inclined to fancy is less often the rule than to adapt a hollow to its use, it does so with apparent dislike, and at the expenditure of considerable trouble. The site chosen is generally a high bank, consisting of soft, sandy earth, or sometimes wholly sand, deposit of the river at some time or other, in which it can work with comparative ease, and form the uncertain-shaped burrow it may desire—sometimes only two or three tunnels, having one or more points of egress into the stream, culminating in an irregular-shaped apartment; at others a considerable extent of gyrate tunnelling, lead to each successive lodge, as they are sometimes termed, which we have just mentioned. Any amount of vegetation, whether reeds, rushes, or any other kind growing out of the water, adjacent, or in close contiguity to, a suitable bank, will probably influence the otter in its choice of a site; while a sharp bend in the direction of the stream will not be without its effects

when an unobserved flight might become advisable or a necessity. Although the otter mostly chooses such a situation as we have named, when it burrows cut its lair, it does not always resort to similarly-featured spots, but will occasionally make holes in any of the places we shall presently mention, as mostly likely to provide the animal with a sufficiently large hollow to be easy of adoption as its lair.

Very often at the roots of large, and sometimes old stunted trees, crevices exist, held in high estimation by the otter, wherein to make its abode, more particularly if the said tree is quite at the very edge of the river's bank or even having some of its roots growing out of the water itself. Again in the dark interstices of some roughly constructed drain, which has become choked up through the accumulation of earth, stones, &c., in its more distant parts. These subterranean gutters are particularly patronised by otters, affording them sometimes not only dry and convenient dwelling places, but also spots where they can when menaced stand at bay for some time, although eventually making good their escape, in an undignified and precipitate manner by some place of safe egress partaking of a "back stair" nature. Most salmon rivers and trout streams have large rocks and boulders along their banks, or at least close adjacent to the same; these rocks, in their natural formation and position, produce many crevices, passages and corners which may be and very often are adopted by the otter and although some of the interstitial holes; offer but poor protection or comfort to any one of these animals which may claim it for an alcove, we have seen others of paramount excellence both as regards defence from danger or as a plain place of abode. Such places as we have endeavoured to describe, and any others of similar nature, may at any time be chosen by the otter, but it is chiefly to weirs that they resort, when such arrangements exist in streams where these anglers' enemies are abundant. There can be no more suitable or favourite place wherein an otter may complacently choose its dwelling, than an old weir, a structure very different to many of the more modern ones of their kind, built up regularly of large blocks of hewed stone fastened together in some way either by mortise or iron rivets. Most of the now tumble-down affairs, no longer used for the purpose to which they owe their origin, consist of large and small unevenly shaped stones and rocks, heaped together in a sort of systematic confusion, abounding in passages and hollows; ready-made otter lairs of the most approved kind, as the water varmints testify by the readiness with which they adopt and cling to them. Such erstwhile obstructions to the water's course, and now mere sieves through which it strains, offer means by which any otters secreted in the fastnesses they contain, can with but little trouble elude any enemies of the human or animal kind, and hence they are invariably very favourable places wherein the otters can form their actual nests in which to bring forth and rear their young, and although those of the animals which may have burrows situate in the banks of the stream for the most part honour such with their domestic arrangements, it is not a very exceptional occurrence for a pair to relinquish their ordinary alcove for the greater safety, one formed with an old broken-down weir offers.

The nest is always placed in as dry and cosy a chamber as can be found, and offering at the same time room enough for the increased number of animals which it must contain. The couch formed is made of a selection of dry fern, grass, and dead rushes, moss, dry flags, and any such similar substances as may be obtainable at a distance sufficiently near to be convenient. The young, curious and pretty enough little creatures, are brought forth generally some time between the middle of March and the middle of June. This is the most usual time, but the otter is very capricious in this regard, and, although the period mentioned sees most young brought forth, newly-born otters have been found at some

time or other during every month out of the twelve. It is, however, not the case of more than one litter being produced during the year, as, as far as we know, there is no undoubted recorded occurrence of a second batch being born to one pair. They number from two to five, very rarely, indeed, more, three or four being the most often number brought forth. Their growth is rapid, and in a very short time they follow their mother at sight of danger into the water, and very soon may be observed being instructed in the preliminaries of their existence, and, no doubt the various devices by which they may secure the dainty fish upon which they will exist and prosper, to the annoyance and disgust, probably, of the enthusiastic and ill-used angler, whose preserved waters they frequent. When left in a perfectly unmolested state, otters are by no means slow of increase; and, with the continual additions of batches of young to their numbers, become more aggressive and bolder in their attacks of the finny population of the waters they frequent, and would, in course of time, clear the stream, frightening away those of the fish which they did not catch to situations less dangerous, and affording more peace of mind and body.

The otter makes its regular meal early in the morning, and for this purpose quits its lair about sunrise, and either commencing its hunt at once, it works up stream, returns at its leisure, or goes down the river, and, whilst satisfying its not at all poor appetite, gradually returns to its dwelling, as it pursues its prey in the orthodox manner. Before actually commencing its chase, the otter, more often than not, indulges in a gratuitous performance for the benefit of any unobserved observer, which it probably considers the usual manner of taking a bath. These preliminary proceedings consist for the most part of dashing about and rolling in the water in one continuous gambol, both otters of a pair generally taking part in them, until it is considered necessary to limit their duration, and they accordingly make tracks in one or the other direction, returning again as the morning gives place to day, and its attendant unsafe features, until, after remaining ensconced in their comparatively secure abode, sleeping away the day, they again, at evening time, issue from their lairs and commit almost as extensive depredations as in the early portion of the day, remaining sometimes without their dwelling until far into the night, sometimes only for a few hours.

Upon the subject of otter-hunting, we shall not enlarge, for, as it stands, we anglers must, on the whole, regard it with distrust; for, although the sole aim of keeping a pack of the hounds specially associated with this sport, we must remember that its votaries desire the increase of the varmints we dislike in order that better runs and better sport may be forthcoming. And although there is no reason why fish preservers should not partake of the joys and excitements of an otter hunt, still they cannot have an excess of the cake and eat it too, hence we cannot but regard, with disfavour, otter hounds kept to hunt well-stocked rivers. But, by all means, let our preserved waters have their otters killed by the hounds, and leave those which frequent good waters to the tender mercies of the owners of them and their river keepers.

It may be as well to remark, before we proceed to the "How to catch them" portion of our subject, that there is considerable difference between knowing how to do a thing and carrying the knowledge into practical effect. Catching otters is not an exception in this wise, and is, on the contrary, one of the most difficult animals to get the better of which there are. An inexperienced person might spend every hour of the day devising means of intrinsic acuteness whereby to lure the otter into his delightfully cunningly set snares, wiles, or traps, and still produce no better result than disgust with one's self at the animal's wariness. To catch an otter in a trap is fraught with difficulty enough; to take it uninjured is almost impossible, except by some remarkably for-

tuitous incident ; but remembering that prevention is better than cure, we mention one or two modes of procedure by which a length of water may be secured from the encroachments of any otters attempting to trespass upon what is not their usual beat. The arrangement we shall name is most suitable only for fairly small streams of not strong a current, and although it can, if desired, be adopted on larger waters, the expense would scarcely represent the effect realised. The first consideration is a suitable position where the banks and bottom of the river present a good even surface, and at this chosen point a sort of fence of wire netting must be stretched across the mesh, of course, sufficiently large to freely admit the passage of anything but an otter. The netting should touch the bottom, and reach some eighteen inches or so above the highest level to which floods may bring the surface of the water. Care must be taken that the two banks are touched. Upon the banks running right down to join the wire boundary, a hedge, otter-proof on each side, must be provided if it do not already exist—the most inexpensive one can be formed of wattled hurdles—it must run from thirty to forty yards out on each side the river. About two feet from the river-bank a gap, say two feet wide, must be left or formed in the hedge, as the case may be, and a common pitfall—consisting of a large hole with a swinging cover—constructed in each gap, so that an otter, finding his entrance into the preserve cut off in the water, seeks the bank, and while endeavouring to pass through the gap, falls into the pit provided for its discomfiture. This arrangement we have indicated is but a fair manner of dealing with the destructively-inclined animals, and, taking all its characteristics into consideration, we prefer to trust to traps of a handier nature, and, as far as we are concerned, decidedly more efficacious. There are two kinds of traps which may be employed with effect, but under different circumstances—the common steel gin, and those of larger size, but of the same kind, with such additions as have recommended themselves for adoption at various times. We purpose mentioning these first. Everybody knows, or at least, everybody who reads this ought to know, what a common rabbit-gin is like, and, such being the case, we shall not stay to enlighten the ignorant. We are acquainted with two otter traps—the one made by W. Shane, of Birmingham, termed the “Ringwood Otter Trap,” is on the same principle as the rabbit gin, only that the jaws range from 6 inches to 10 inches in length, and at alternate intervals are provided with sharp spikes instead of the usual teeth which, when the trap springs, meet in a certainly cruel manner through the varmint’s leg. The spring of the trap is not strong in comparison with its extra size, being only sufficient to effect the closing of the jaws with sufficient force. Instead of the usual short chain, a long one is provided, and the instinct of the otter when caught leading it to seek deep water, the weight of the encumbrance on its leg prevents it rising, and it quickly drowns. These formidably-constructed affairs cost from 10s. 6d. to 18s. 6d. Another trap manufacturer, H. Lane, of Wednesfield, makes a special trap for otters, too ; his partaking more of the nature of an enlarged rabbit-gin, in which strength and handiness are well combined with general excellence of construction ; its working being as “tickle” as any one can desire. Either of these wiles are exceedingly effective for the purpose intended, and if any extra-sized gins be required, we are able to recommend them ; for, although there are large-sized ordinary rabbit-gins, they are too small, and, what is worse, will not hold sufficiently well to be employed under the circumstances now to be named.

Every otter has its own peculiar spots for landing, whether with prey to be consumed or without, for any other purpose which may necessitate it visiting dry land. These spots are generally at some portion of the bank where it slopes easily down to the water, and is devoid of covering in the shape of grass ; being either of damp, muddy soil, or soft sand. If any such places are to be

observed, they should be carefully scrutinised whenever an opportunity occurs ; and, if they be frequented by otters, passing from the water to the bank, or *vice versa*, footprints of the animal will be discernible, and can be easily distinguished by the impression left by the sole of the animal’s foot, which partakes of the shape of a little ball, and is termed its seal. The ground being well trodden down, and showing abundant evidence of this being the result of continued passing and re-passing by otters will prove the excellence of the spot whereon to set one of the large gins, instructions as to which we shall defer till our next and concluding paper.

THE GENERATION OF EELS.

ONE of the most profound ichthyological problems has been that of the generation of eels. It has occupied the attention of scientific men in all ages, and we have much pleasure in giving our readers the very latest on the subject, taken from a recent paper by Dr. Quistorp, read before the Society for the Protection of Animals, at Greifswald, Prussia.

Although the eel has been known to man and has served him as food for thousands of years, it has preserved the secret of its reproduction intact until within quite recent days. Only 40 years ago was it said by Martens in his work on Italy, that of all animals by which we are surrounded, the eel alone has not yet divulged the mystery of its procreation to the most persevering and painstaking of investigators. Aristotle busied himself with the problem and advanced the marvellous solution, one little in keeping with his accustomed perspicacity, that eels were generated from the intestines of the world, for in this light he seems to have regarded earthworms (*Lumbricus terrestris*, L.). Later on, eels were thought to owe their origin to other fishes, and of these the viviparous blenny or eelpout (*Troarces viviparus*, L.) may be fittingly mentioned here. To this day, even in Sardinia, is the parentage of eels ascribed to a large black water-beetle (*Dysticus Roesellii*). As eels are frequently found infested by internal parasites, chiefly a species of threadworm (*Ascaris liabiata*), it is not surprising that these should have been mistaken for young eels, or that eels generally should have been classed among viviparous animals. It was only towards the end of last century that an Italian savant, Professor Mondini, holding the chair of Anatomy, at Bologna University, first succeeded in finding the sexual organs of the female eel. Soon afterwards the identical discovery was made in Germany by Otto Friederich Müller, but quite independently of Mondini, whose researches, although concluded in 1777, were not published until three years later, during which interval Müller’s quest also was successful. Although this important step was gained, yet no one, in spite of uninterrupted endeavours and dissections of vast numbers of eels, could discover anything approaching the nature of male sexual organs. And chiefly for this reason, because only the largest and best developed eels were selected for examination, whereas these, as we know now, are invariably females. In consequence of this inability to discover any male sexual organs, a great many physiologists pronounced the eel to be a true hermaphrodite. However, when Dr. Darwin, instructed in this matter by Dr. Günther, the celebrated ichthyologist of the British Museum had made known that so far as he was aware, the males of fishes were never larger than the females, it occurred to Dr. Syrska (at that time Director of the Academy of Natural Sciences at Trieste, now Director and Curator of the Lemberg Zoological Museum), to experiment upon smaller instead of the largest specimens, and very soon he was able to announce the long sought-for discovery of the male eel’s sexual organs. In the Adriatic the male is never longer than 19 inches, whereas all eels of greater dimensions than this are without exception female. The position of the sexual organs in the male is identic with that occupied by the ovaries

in the female, namely alongside of, and attached by one edge to, the air-bladder. Whilst the ovaries are ruffle-like and crinkly, the male organs, besides being much less easily discernible than those of the female are smooth and ribbon-like in form with slightly ragged edges; they are also more transparent, of a lighter colour and enveloped in a covering of fat. An excretory duct leading from the reproductive organs of the male has also been observed, and in the female this is wanting. In the case of the latter it has been noticed that when the ova separate themselves from the ovaries, they drop freely into the abdominal cavity, from whence, according to observations made by Herr Radke, of Königsberg, Prussia, they escape through two orifices situated close to the anus. All that is now wanted, is the discovery of the actual presence of spermatozoa in the seminal fluid of the male freshwater eel, but inasmuch as these minute organisms have already been shown to exist in the reproductive organs of the male conger-eel, by Dr. Hermes, of Berlin, it is not unreasonable to assume their presence in *Anguilla Vulgaris* also. From this it will be seen that eels also are divided into milters and spawners, and like all other fishes are developed from ova. In a like manner they have a fixed time of spawning, which in their case is in winter. Their spawning beds are to be found in the sea and not in the brackish water of estuaries or lagoons. The procedure is as follows: the females deposit their ova on mud-banks far away from the coast, where these are duly fertilised by the males in the manner common to other fishes. From these impregnated ova the young eels are produced, and in five or six weeks' time attain a length of from one-quarter to five-sixteenths of an inch. During spring millions upon millions of these tiny creatures make their way up stream, and aided by the tenacious slime with which they are provided creep over and surmount every obstacle in their course. From this time until they are some five or six years old eels remain in fresh or brackish water, for, as the result of investigations carried on at Commachio, on the Italian shores of the Adriatic, where eel-fisheries abound, it appears that eels are incapable of reproduction before that age. When this stage is reached the eel hastens to the sea during the later autumn months; and it is only in real salt water, and not, as hitherto supposed, in brackish water, that full sexual development of both male and female can take place. Only on one single occasion has a gravid female with ripe ova been captured by Radke in brackish water. Having spawned, the eels die off, totally exhausted by the recent rapid development and functional employment of their reproductive apparatus; at least, they are never caught when reascending rivers just after spawning. This statement, it should be noted, is not yet conclusively proved; there are many professional eel-catchers who doubt it in part, or deny it altogether. Eels eat no food whatever on their way down to the sea, and in this respect also, they take after other fishes. In addition to the spawning eels, there are, however, others, in whose intestines food may at all times be found; and these are always in condition and fat, as they never stir out of fresh or brackish water. All these are barren females, whose ovaries, if examined, will be found in a degenerated condition, with transparent and almost or entirely yolkless ova.

Subjoined are some of the external marks by which the sexes may be distinguished:—

Firstly, as to size: the male never exceeds 19 inches, whereas the female is frequently above 3 feet, and thicker than a man's arm. Secondly, as to shape of head: in the female a marked greater breadth of snout, as compared with the narrow, and either elongated or short and sharp-pointed snout of the male. Thirdly, as to colour: the female is usually green on the back, with a yellow or yellowish belly; the back of the male is of the very deepest green or intensest black, the sides of great metallic lustre—at times even entirely bronze-coloured—and the belly mostly

always white. Fourthly, a conspicuous difference in the dorsal fins: those of females are much deeper and broader, as compared with those belonging to males of equal dimensions. And, lastly, a distinguishing mark—upon which, however, absolute dependence cannot be placed: this is the proportionately greater diameter of the eye of the male; generally speaking, when eels are found with conspicuously small eyes they are females, although numerous exceptions not unfrequently occur.

THE FISH OF THE TRENT, AND HOW TO CATCH THEM.

PLAIN PAPERS FOR PLAIN ANGLERS.*—No. 9.

BY THE TRENT OTTER.

THE CHUB (*continued*).

BEFORE I proceed to treat of the various ways of taking chub it will perhaps be well to look at him a little more closely. The roach has a book, so has the pike, and why not the chub? But I feel my inability to treat the chub as he ought to be treated in a book of his own. But what pleasant recollections I seem to see in my mind's eye at the very mention of the word "Chub," ay! as vividly as though they only happened yesterday, for some of the pleasantest hours of my life have been spent by the river-side in my search for chub. In spite of what has been written or said against the chub, in spite of his faults, I love him. Still, even when the cruel net is put round the weed-beds in the scouring time, and he is dragged to bank; or when the night-line has done its work, and he is hauled out without a chance of showing his fighting power, even then I love him; though my love is mingled with pity for his ignominious fate, for he is a foeman worthy of a sportsman's steel, although writers speak with contempt of him, and call him all sorts of names, some of which are libels on him and his character. If I aspire to greatness in any matter, or perhaps, to put it more correctly, I ought to say, if I have a weakness, that weakness is "Chub fishing," for I have been told that it really is a weakness, and one or two have gone further and called me a "fool," after I have had an adventure something like this. I am standing by the river, rod in hand; the twilight of the summer day has deepened into that semi-darkness that is so peculiar to our country districts, where the air is free from smoke; strangely quiet seems nature in her peaceful repose, a strange quiet that is only broken by the harsh grating croak of that peculiar bird the corn-crake, or the splash of a rising chub. Away in the distance I can see, though dimly, the pointed tip of a village church spire, trees, bushes and hedges seem to merge together, strangely indistinct, while the river flowing past seems, on the opposite side, to be dark and mysterious. Feeling carefully down my line and cast (for I am fishing with but one "fly," and it is a large white moth with golden rings round its body) to "see" that the moth is all right, I sweep it out into the river, and wait, for I cannot see it: Ha! a brave tug; and the next moment a chub is gallantly fighting against odds for life and liberty, but no go; in another minute or so he is safe in the bag to join some three or four more of his comrades in distress that have been taken by the same means. But, hark! What is that? The village church-clock is striking, clear and distinct, through the stillness of the night. Sound the strokes—eleven. Time to give over, thinks I; so packing up, I trudge homeward, for I am a few miles from home, and when I arrive there, I am called by the before-mentioned classic name. "What a fool you are to stay while this time of night, just for two or three brace of those things" (chub). But I can forgive them, for they don't know of the

sweet intercourse I have had with nature in her midsummer night's beauty; none but sportsmen can enjoy these things as they ought to be enjoyed, and I am weak enough to say that fishing on a summer's evening with the moth for chub is a sport for me, at least, of the highest order.

But hold, I am making a most sweeping digression, and must pull up, for I was going to look at a few names the chub is known by and take his part generally. Izaak Walton called him "Cheven," "Chevin," and "Chevender," and by some of these names he is still known in certain districts; and Father Izaak also says, "Oh, it is a great loggerheaded chub;" and some modern writers, in speaking of him, call him "loggerhead;" but one modern writer had actually the cheek to call him "chuckle-headed." The Scotch call him "Skelly;" the Welsh "Penci;" and the Swedes "Kubb," which latter means "a lump of wood." Now, if we look at these names, we can see that most of them are alluding to the head of the chub (which is, by the way, called in some districts "the large-headed dace"), but why he should be called big-headed, &c., &c., I really cannot imagine, for I have had a splendid specimen of $2\frac{1}{2}$ lb. weight, and laid him broadside on the grass, and really his head does not look at all out of proportion to this body; shoulders, broad and vast; belly, deep and rounding off; back, a trifle hollow, and ending in a fairly broad spread of tail; but no, look at him from that standpoint, and his head is not out of proportion. If you stare him in the face, perhaps he does look a little full-faced, and he has rather a large mouth, but he really does not deserve the names of "loggerhead," "chuckle-head," &c., &c., that are so often applied to him. Why anglers who angle for pleasure delight to sit on the chub and call him names, I cannot imagine. These people ought to be the last in the world to call him, for there is not another coarse fish that is such a pleasure to capture, nor that can be taken by such a variety of ways, and then for a few minutes he fights well, so they need not grumble on that score. True, he is not worth salt when you come to cook him; for he is woolly watery, and disagreeable, and has such a plentitude of small bones that to eat him would almost be to risk being choked; but I have nothing to with cooking him, my business is to catch him, and I maintain that he is a handsome fish; and, as a sporting fish in all weather, he has not his equal among the so-called coarse fish.

Since writing the previous article about weight of a chub, I have had authentic information about a chub that I should suppose to be the biggest one ever taken out of the Trent with rod and line. It appears that a Newark angler, named Frank Sims, was some years ago fishing for chub below Newark at what is called the foot of the lawn at Wenthorp, when he was lucky enough to take and safely land a monster that weighed eight pounds. I believed this fish suffered the indignity of being either baked, boiled or stewed, when it ought to have been made beautiful for ever, and not only it, but Frank himself, ought to have been put in a glass case. These facts are well known among certain anglers at Newark. Any one doubting the statement that would take the trouble to write to David Slater, fishing-tackle maker, would have the statement verified. It would be a glorious chub. Should not I like to handle such an one. Why, I should think my mission on earth was fulfilled, and I should have nothing else worth living for.

(To be continued.)

THEORY OF ARTIFICIAL FLIES.

I AM glad that my theory on artificial flies has called forth such a courteous argument from the other side of the question as that of Mr. Walbran's, and I hope I may be allowed to say a few words in reference to it.

In the first place, though it may rob fly-fishing of some of its

charm, but very little, I think, it certainly saves an immense amount of time and trouble if the angler only uses about four varieties of flies for his pursuit. It is often very difficult to tell what flies are out on the water, especially in the days of early spring, when one seldom sees any at all. Mr. Walbran remarks in his article, "To my mind, the chief enjoyment of this kind of fishing (fly-fishing) is to match your flies with those upon the water, and then, by casting them lightly as thistledown, deceive the fish with an imitation of the very fly that they are feeding upon." All this sounds very well in theory, but I think Mr. Walbran must admit that artificial flies are very imperfect imitations of natural ones, and that trout can hardly be supposed to take all the various imitations of the same fly, dressed in so many different ways, for the original one. As I said in my former letter, I do not see the good of having so many flies only differing from each other in minor respects, some having a little more colour than others, as the colour fades in the water, and they thereby lose their distinction; though Mr. Walbran cites an incident showing the trout's nicety of distinction very clearly. The following is an incident showing the contrary:—One day last summer, I was fly-fishing on the Derbyshire Wye in Rowsley Meadows, in company with a friend from Liverpool. During the day we each of us used different flies, myself having blue and yellow dun on my cast, and my friend employing a red palmer and black gnat to lure the trout, and had had indifferent success, only catching two brace each. In the evening my friend changed one of his flies and employed a white moth in exchange for the black gnat; I used the same I had during the day. When we left off we had each taken four more brace, after an hour's fishing, during which time the fish scarcely rose at all, and those that did, came very short. I could see that they were rising at some little fly, of a kind unknown to me, but I determined to try whether the fish would not rise at my blue and yellow duns as well as at the fly on the water. It is no take to boast of, but I think it shows pretty well that trout may be caught by any neatly-dressed fly, provided it is a standard one.

Of course, there is no harm in an angler using flies for every hour in the day, if it so pleases him, but this practice is attended with great trouble. It is a great nuisance to have to untie your flies three or four times a day, and to put fresh ones on; this of itself is a good reason for using the same. There is no doubt, on the other hand, that many veteran anglers prefer a good variety, and maintain that trout can better be enticed by changing their lure several times a day; but these gentlemen credit the trout with a nicety of distinction which it is very doubtful they possess; though on some streams, of course, they are far shyer and better educated than on others, and require their taste to be tickled with a neat "imitation," before they can triumphantly be lifted out of their native element by that most useful invention, the landing-net, and from thence be transferred to the angler's basket, thereafter to be eaten with great relish where a hard day's work to effect their capture has been undertaken by the piscator. Although opening the stomach of the first fish you catch is doubtless a good idea for the disciples of the many varieties system, I think few anglers would do so; it would be a dirty job, and the flies inside the trout would not be very easily recognised, being greatly disfigured. However, I have never tried that way, and so do not speak from experience. In conclusion, let me again state, that I think trout can never distinguish between so many flies as Mr. Walbran would have anglers use; that there is no difference between many of them, though dressed slightly different in the water, as the colour dies out; that using only four varieties saves much time and trouble in changing flies; and that fish may be caught by any standard-fly provided it be neatly tied and well made.

RIVER REPORTS

MID-THAMES.

“Now 'tis the winter of our discontent.”

—SHAKESPEARE.

The flood is again upon us, and angling in the river is a game not worth the candle, although within the last few days some decent hauls of chub, perch and roach have been had. Thames anglers must wait until the “glorious summer” before they will be enabled to exercise their favourite vocation, in the meantime, Othello-like, I shall have lost my vocation, but shall not fail to “open,” like a good hound, if I hear or see a chance among the spotted beauties during April and May, amid the lovely and well-stocked waters between Staines and Goring. Why go further and possibly fare worse? I have some dozens of reports of catches of roach and chub during the past week, but the record is hardly worth print.—MARLOW BUZZ.

Thames (Goring).

Water thick and high, will do for roach-fishing with worms. Prospects: A few fine days will soon get the water in order again, but not before the close season for jack. By Sunday, if it keeps fine, water will be a lot better. Water sinking. On Sunday we took some good roach, two roach going near on 3 lb. —JOHN RUSH.

Thames (Richmond).

The heavy rain that fell at the end of last week put the river quite out of order, but anglers have been nothing daunted, as there has been plenty of work during the week. Some of them, when told it was no use, were determined to have a try; one of these getting six bream. We have two very good trout here this season—I should think they are between 9 lb. and 10 lb. each. There is nothing feeding much, bream being easiest to catch; roach and dace have gone off this week. The sport of the week is as follows:—Job Brain, four days, 40 lb. of bream and dace; C. Brown, two days, 14 lb. of dace; E. Brown, one day, 3 lb. of dace; H. Wheeler, two days, 13 lb. of dace; H. Howard, one day, 7 lb. of dace; J. Bushnell, five days, 43 lb. of bream and dace. The river will improve every day to the close now.—J. BUSHNELL.

Thames (Twickenham).

The water is fining down very nicely, considering the large quantity of water that is coming down from up the country, and should the rain keep off we may expect to have a day or two's sport before we close. I have had two punts out this afternoon, and each did much better than I expected. The weather is quite like a summer's day. N.B.—A Postcard in advance, mentioning the number coming, will always ensure a punt in readiness. Error.—In last week's report it should read R. Vart not V. Vart, James Brand not Tom Brand, A. Perrin not Pierson.—ALFRED PERRIN.

Thames (Windsor).

My report last week that everything was in the pink of condition, was upset almost before it appeared in print, and now we have it as bad as it is possible to see a river as regards colour, and almost the same as regards height; as for trout signs, one might as well look for their playing about on Hampstead Heath, as in this sea of soup. One, certainly was seen, Sunday last, but quite by compulsion, as doubtless he was as far from the surface as it would be possible for a fish to get. That seductive bait, a good lobworm, could not be refused, and picking it up, was soon admired by a group of bank anglers before being returned by its captor, Paice of Etonwick, who, with a patron, got 3 nice chub, about 9 lb. The trout was a very handsome one of about 4½ lb., and was returned in that part well known to bank anglers, the “Whirly Hole,” at Boveney Bridge. Before this water James Gray was showing his patrons sport, having had some 4 or 5 dozen perch, besides 7 jack during the week, and whilst up river, I boarded his punt to see a nice jack, that Mr. Parsons, of Windsor, had just landed on a fine gut roach hook (B's), baited with worm; it was a beautifully marked and good conditioned fish of 6¾ lb. Who shall say jack do not feed at times ravenously on worms, as when landed they left this fish in quantity as they would from an old chub. He must have lain there and gorged on them, as Gray had previously given it a good baiting. I also saw a nice lot of roach and perch, one of the latter going nearly 1½ lb. That barbel are late this season is proved by Mr. Linford taking a nice specimen over 5 lb., on Tuesday, with worm on the grass; and to-day, Mr. Way, of Windsor, fishing with James Gray, took 5 barbel, but small. Should rain keep off, bank anglers will be able to have a final turn at them, and with worms in quiet places, stand a chance of a miscellaneous bag.—B. R. BAMBRIDGE.

Barle and Exe (Dulverton).

At the present moment there is a flood coming down these rivers owing to the rain which has fallen on Exmoor during the last few days. The barometer is rising, and there is every prospect of fair weather, with which, when the water fines down, good sport may be expected. Some few baskets of trout have been taken during the past week with blue upright, silver twist, February red, and March brown. These flies, as well as any kind of fishing tackle, can be had at the post-office, and of Mr. A. N. Arbery, of the best description.—G. WILLIAMS.

Colne (Thorney Broad).

If there is no more rain the water will be in first-class condition by Saturday. There is every prospect of some good jack and roach fishing with the worm; wind, S.W. Mr. W. T. Hawkins and Browning were out on Sunday, and the

former took one roach, the water being at high flood at the time. Mr. Drake is out to-day, but he is not in yet, so cannot give the result. Jack fishing comes to an end on the 15th March here, but we do not close for roach till the end of May, as they do not spawn so early as in the Thames; perch and dace fishing is closed on the 15th.—E. GODFREY.

Dove (Derbyshire).

The frost has broken up at last, but now we are flooded, the river being over its limits with snow water from the surrounding hills. The bottom-fishers, though the season is now all but over, have not been doing much since I last wrote, the water having been too much discoloured. The trout-fishers, however, have been enjoying nice sport, some with the tail-end of the good old fatherly lob, and others with the cockspur. The “speckled ones” would not take the fly, and so the devotees went in for bottom-fishing. One gentleman in the famous “Dale” got six beauties; another, near Birdsgrove, five, and a third, near Clownholme, four. Others have had similar sport. The weather is still very unsettled, and “wild March” is keeping up its character to a nicety, the winds being simply terrific.—THE SPLODGER.

Exe (Tiverton).

Fishing during the past week has been *nil* (except in the tributaries, where a good many trout have been caught with the worm), the river being in flood. If no more rain, in the course of two or three days it will be in excellent condition, and some good sport is looked forward to. Wind, west; barometer, rising.—WM. MUDFORD.

Exe (Exeter).

We are still in the same dilemma. Rain and nothing but rain. “Water, water everywhere,” and yet we cannot fish; and seeing that next Saturday will be the 12th, we may say adieu until June, as far as rough fishing is concerned. With regard to trout-fishing, I will keep you posted up. Prospects are looking better, but up to the present little or nothing has been done. The river is in a turbulent state, and all kinds of colours. Salmon are very plentiful, and some good hauls have been had—size exceedingly good, from 12 lb. to 20 lb. weight. The regular net fishermen have not commenced yet. The angling club that I advised you of in my previous notes will soon be enrolled, and hope to be in a position to forward you all the &c., &c., shortly, when brain and hand will in concert find fresh vigour for the (fly) angler's mind.—FRANK GOSDEN.

Medway (Tunbridge).

Owing to the heavy rains the water is very thick, and the anglers will, we are afraid, be obliged to finish up the season in a very unsatisfactory manner. As the close season commences on Tuesday next, there will we fear be no more sport worth mentioning. There has been nothing done during the week of any importance. Pike and other fish are running up the streams for spawning which will be late in our water on account of the cold weather.—YE MEDWAY WATER RAT.

Suir and its Tributaries (Clonmel, Ireland).

We have had such a heavy flood that during last week the cot-men could not fish at all, but the river is lower since Monday, when they killed six salmon, and six also on Tuesday. Price of fish 2s. 4d. per lb. Between Monday and Wednesday Captain Palliser, at Rochestown, had very good sport last week, landing five splendid spring fish, the largest weighing 30 lb., which was a beautiful short fish. Mr. Edwards, at Kilcommon demesne, got two spring fish weighing 20 lb. and 12 lb. respectively. John Breston, at New Castle, landed one also of 22 lb., and some others were equally successful whose names we have not ascertained. The water is not at present fit for salmon fishing, but if we have no rain in the meantime it will be fit to fish after a few days. The trout fishing is pretty fair, and far beyond what it was this time last year. Mr. Hughes, we heard, had a great day on the Suir, killing 9 doz. trout. The Devon bait is still a favourite one to fish with, and proves most killing, particularly in clear water, with a good strong breeze. The favourite trout fly at present is orange grouse. Most of the heavy trout are gorging themselves with salmon roe. The glass is steadily rising those three days, and wind easterly.—DORA.

Trent (Alrewas).

I had scarcely posted my last week's report, when the Midlands was visited by another of the heavy falls of snow we have had this year. This was followed by a copious downpour of rain, which quickly brought on another great flood. Angling has, like the many past weeks, been a complete dead-letter. The water is now rapidly running off the meadows, but there are still miles of water which should be land. Angling before the 15th seems out of the question. Of the many bad seasons we have had of late years, the present one, I think, is by far the worst. There has been no trout-fishing in this locality of any import since November. The members of the Birmingham and Midland Piscatorial Association have been successful in obtaining an extension of the close time till May 15, for their private fishery at Alrewas and Croxhall, from the Trent Conservators; consequently, I shall have the pleasure of sending you my usual report, while the public fisheries are closed. The weather at present is positively warm and has a more settled appearance; how long it will last, the “deponent” knoweth not.—JAMES GREGORY.

Trent (Nottingham).

The Trent has been in a flooded state all the week, and there has not been a chance of doing any rod fishing. Up to the time of writing (Thursday night), the surrounding meadows are all under water. The weather, however, to-day is more settled, and the river going down rapidly; so that, weather permitting, the anglers will get a chance of some sport before the 15th, which commences the close season. For my part, I never could understand a close season for angling, because it is impossible to catch the fish unless they are in condition to bite; but the netters catch them whether they are in condition or not, and a great quantity of different fish have been brought into Nottingham during the recent high water. I say—stop the netters and leave the anglers alone.—W. BAILEY.

Wye and Derwent (Derbyshire).

We have had continual floods on both the above rivers since my last report. From the heavy rain that has fallen daily, to-day (Thursday), both rivers are running down nicely. The Derwent will be all right for bottom-fishing by Monday. The Wye will not be in condition for fly-fishing for a week or ten days at the earliest. The cleach net party have taken a good deal of fish below Darley Bridge during the late floods. Bottom-fishing prospects good for next week with worms for baits.—G. J. EATON.

Yare (Norwich).

Anglers are now taking advantage of every fine day, and some very decent catches are reported. I should like just to suggest that members of our local societies should exhibit their catches at their respective club houses, and so follow the example of our friends in the metropolis and elsewhere. The catch being duly reported in a book kept for that purpose would serve as a guide in deciding argument or any question that might arise in future. I am also very pleased to find that most anglers are acting upon a previous suggestion of mine, and that was to return all undersized fish to the river again. This is as it should be, and I trust that all will co-operate in following this out. Mr. W. Chittleburgh, of the Champion Angling Club, exhibited a very fine pike in his club room, weighing upwards of 15 lb., and when opened was found to contain two very fine eels. Mr. Hinsby, of E.A.P.S., also showed a catch of roach and bream, said to be the best take this season as to size and weight. Messrs. Palmers, of the same club, also showed a fine take of pike from a small stream in the vicinity of Norwich, scaling about 35 lb. (six fish in all), the largest weighing 9 lb. Mr. Corbyn, of the Norwich Piscatorial Society, also produced a very fair basket, and among them a species of a hybrid resembling a roach and bream, flat. This curious specimen is now in the hands of Mr. Gunn, naturalist, of St. Giles Street, Norwich, for the purpose of preservation, and will be exhibited at the forthcoming exhibition. Mr. Pearce, and friend, of Norwich, while fishing in the waters of G. H. Wilson, Esq., of Redgrave Hall, succeeded in landing two fine jack, weighing respectively 11 and 13 lb. At a meeting of the General Committee of the General Fisheries Exhibition on Saturday it was resolved to extend the annexe in course of erection 40 feet in consequence of the increasing number of the demands for space. The attention of boat builders might be called to the prize of £10, offered by the Yare Preservation Society for the best model of a fishing boat for Norfolk inland waters, which has additional importance from the fact that the successful competitor will not only carry off the prize, but probably obtain the order for the new boats of the recently formed Yare Fishing Boat Club. In conclusion I am sorry to have to report that no improvement has yet taken place as to the polluted state of our river.—**ANGLER.**

Yore (Yorkshire).

I was too much disgusted last week to write any report at all, for at the time that I should have sent it snow was falling fast, and at night there was a thicker cover upon the ground than there had been since Christmas. Next day came the usual thaw, accompanied by torrents of rain, the result being tremendous floods down both the Yore and Wharfe. Where the damage will end is difficult to prognosticate, for as I write the wind is blowing a regular tornado, driving the rain before it in sheets. The only consolation that anglers derive from the long-continued rain being that the river will be thoroughly cleared from snow water, and then, with a week or two of fine weather, trout fishing should commence in real earnest; in anticipation of which I purpose in my next week's report to give your readers a few patterns for flies that I know, from personal experience, to be killers on both the Yore and Wharfe.—**FRANCIS M. WALBRAN.**

SHOULD OTTERS BE KILLED?

A WRITER in a contemporary denounces the late act of otter-slaughter on the Thames and the pound reward given by the Reading Angling Association, as "a more disgraceful act than he had seldom heard of." Mr. Francis Francis thinks that when a pike gets hold of a fairish-sized fish, it takes him some time to consume, during which the pike kills nothing. But how many, and what weight, of fish will a full-grown otter kill, if he eats only the "tit-bit" out of the neck? Besides, why not denounce otter-hunting—a most ancient sport? I believe the Reading Angling Association are quite justified in what they did. We don't keep hawks nor weasels, &c., in game preserves; a farmer would not tolerate a fox, except in a hunting country, and where he is paid for poultry killed by Master Reynard. The love of angling is increasing every day; fish must be protected alike from poachers and their natural enemy, the otter. A naturalist in the North of England might regret otter-killing in the South. I say, save the kingfishers; protect the breeding-ponds from all birds of prey, not forgetting the herons in Coley Park; but death to the otter!

SPOTS.

ANGLING NEWS.—An angling correspondent reports a splendid take of pike on Wednesday in last week, by Mr. L. Goodhind and Mr. F. Hurley (members of the Reading Association), consisting of eleven fish ranging in weight from 14½ lb. to 5 lb. each, and weighing in the aggregate 66 lb. Roach and tench are in capital order, but other fish, particularly perch, are getting very heavy in spawn. The prospects of the approaching trout season on this part of the Thames are particularly good.

GREGORY'S SPINNING BAITS.—"The Gregory," the "Flexible Cleopatra," the "Oxford," and the "Colorado," pronounced by all Anglers and the Press the best baits invented for salmon, trout, pike, and perch. To be obtained from all respectable fishing-tackle shops in the world, and wholesale from Messrs. S. Allcock and Co., Standard Works, Redditch. Flattering testimonials speaking of the efficiency of the baits have been received from the Right Hon. John Bright, M.P.; Mr. William Bailey, Nottingham; the Rev. E. C. Holt, Teddington; Sir William Calder, Kingston-on-Thames, &c. Gregory's registered Archimedeian spinning tackle for pike and trout, now ready, is pronounced by the press the best ever invented. For use with dead bait. The tackle is complete in every respect, and can be adjusted to suit bait of any size. Has been tried with remarkable success.—See that the name "Gregory" is impressed on the Archimedeian fins, as inferior imitations are offered for sale, and people are thereby disappointed and deceived. Address, James Gregory, Vyse-street, Birmingham.—[**ADVT.**]

GEORGE JAMES EATON, of Starkholmes Matlock-Bath, Derbyshire, respectfully invites Noblemen and Gentlemen to try his standard FLIES for the present season. No flies sent or made up but what he himself has proved sure killers. A trial is all that is required from gentlemen who can fish to prove whether they may be genuine or not. Patronised by some of the best fishermen of the day. All flies dressed on the best Kendal hooks. Prices: Point Flies, 2s. 6d. per Dozen; Dropper Flies, 2s. per Dozen. Orders punctually attended to.—[**ADVT.**]

INTERNATIONAL HUNTING AND SPORTING EXHIBITION.

AN International Exhibition of Hunting and Sporting Apparatus will be held at Cleves (Rhenish Prussia), from June to October next, under the auspices of Prince Hohenlohe-Langenbourg, the Burgomaster of Cleves, and other distinguished personages. The classification includes fire-arms and other weapons, and ammunition as used from the earliest to the present time; dresses and accoutrements for hunters and anglers, fishing tackle, hunting carriages, stabling, horns, hides, skins, and articles manufactured therefrom; stuffed animals, birds, &c. Prize medals and diplomas will be awarded. Cleves is a well-known watering-place, 18 hours journey from London. The direct route is *via* Harwich and Rotterdam, and the Great Eastern Railway Company purpose making special arrangements in regard to the passenger and goods traffic in connection with the exhibition. An influential London Committee of Patronage is in course of formation. Forms of application for space, and all particulars may be obtained of Mr. Edmund Johnson, Commissaire Délégué, International Exhibition Offices, 1, Castle Street, Holborn.

FRESHWATER FISH.

ANGLERS are reminded under the Freshwater Fisheries Act of 1878, section 11, the close season for fishing commences on the fifteenth day of March, and consequently Monday next is the last day of the general angling season. The sale of freshwater fish is also prohibited after the fourteenth day of March, and if any person during the close season buys, sells, or exposes for sale, or has in his possession for sale, any freshwater fish, "he is liable to a fine of forty shillings for the first offence, and five pounds on a second or any subsequent conviction." Any person can lay information where fish are exposed for sale, and the police are under instructions to take action in all cases. Although the counties of Norfolk and Suffolk are not included in the Freshwater Fishery Act as regards angling, the selling of fish from those counties comes under the Act.

FISHERIES PRESERVATION ASSOCIATION.

A MEETING of the council of this association was held on the 28th February last, at 13, Upper Belgrave Street. His Grace the Duke of Northumberland, the president of the association, in the chair. It was attended by Lord Abinger, the vice-president; Mr. Spencer Walpole, Mr. A. D. Berrington, Mr. J. W. Willis-Bund, Mr. John Lloyd, jun.; Dr. Peter Hood, and Mr. Higford Burr.

Resolutions were unanimously passed expressive of the council's sorrow at the great loss they and the association had sustained by the deaths of Martin Tucker Smith, Esq., one of the founders of the association, and Frank Trevelyan Buckland, Esq.; and the council's grateful sense of the valuable services and active aid each of those lamented colleagues had rendered in advancing the objects and promoting the welfare of the association. A further resolution being at the same time passed that letters be addressed to Mrs. Martin Tucker Smith and Mrs. Buckland, expressing the council's deep sympathy with them under their bereavement. The council then proceeded to consider two Bills that are before Parliament viz., the Rivers Conservancy Bill and the River Floods Prevention Bill, when they stated it as their opinion that it would be very desirable to get, if possible, the words "without the previous consent of the Local Government Board," or some other suitable and effective words, inserted in both Bills in the clauses 14 and 16 respectively, which give power to the Boards proposed

to be created to enforce the Rivers Pollution Prevention Act, 1876, so as to secure a more summary and expeditious mode of prosecuting offenders against that Act than is provided by the Act itself. After some discussion, Mr. Willis-Bund undertook to consider the matter and to frame an amendment such as might appear to him effective for the purpose.

The council then passed to the consideration of the Bill before the House of Commons "to consolidate and amend the Salmon and Freshwater Fishery laws of England and Wales," and in the discussion thereon which ensued, and in the course of which the council declared their approval generally of the Bill, Mr. Willis-Bund informed the meeting that there was strong reason to believe that attempts were about to be made to obtain the legalisation of the spear in the taking of salmon, and also to make the capture of samlets legal, both at present being illegal; that his Conservancy Board (the Severn), being very hostile to such legalisation, as a retrograde and most injurious step in fishery legislation, had just passed resolutions strongly condemnatory of the proposed changes, and pledging the Board to oppose them in every possible way. After some consideration of the matter the council came to the conclusion equally with the Severn Board that the legalising of the spear and of the capture of samlets ought to be strongly opposed.

The secretary reported the result of the large and influential deputation with which, since the last meeting of the council, the association had gone up to the president of the Local Government Board to urge on the Government the amendment of the Rivers Pollution Prevention Act, together with the recent answer on 8th February last in Parliament of the president to Mr. Birbeck, namely: "That he could hold out no hope that the Government would introduce this session a Bill to amend the Act."

Mr. Martin Ridley Smith and Professor Thomas Henry Huxley, F.R.S., Her Majesty's newly-appointed Inspector of Fisheries, were unanimously elected members of the council; the first in the room of his late father—Mr. Martin Tucker Smith—and the latter in the room of the late Mr. Frank Buckland. Thanks having been given to the Duke of Northumberland for presiding, the business of the meeting then closed.

WOOL SOCKS FOR WADING.

MR. J. W. TACON, Hosier, of 277, High Holborn, London sends us a pair of his extra-stout wool socks for use over the indiarubber fishing stockings when wading. They appear to us to be excellently suited to the purpose, and as they are considerably cheaper than those usually sold to anglers, we doubt not many of our readers will take note of Mr. Tacon's address.

ANGLERS should always be provided with something to take away the swelling and poisonous effect of the bites of insects. They should also have with them something to apply to a cut or sprain. Pond's Extract reduces the swelling and inflammation, stops bleeding and pain, and hastens the healing process in case of any wound or sprain; and it has no equal for application to the bites and stings of insects. Therefore never go on a fishing excursion unprovided with a bottle of Pond's Extract. It is for sale at all chemists, at 2s. 3d., 4s. 6d., and 8s. 6d. per bottle.—[ADVERTISEMENT.]

TIED HANDS AND ARMS.—Edson's Electric Armlets and Wrist Bands. Invaluable for anglers and gun sportsmen and highly recommended for all persons having tiresome writing, sewing, or music practice. They give wonderful energy and strength, enabling the wearer to accomplish tedious work with steadiness and comfort. Price 2s. 6d. per pair, silk web and fine steel clasps. Sent to any address on receipt of P.O.O. payable to J. Edson, the Electric Fabric Co. Patentees, No. 1, Charlotte Street, Bedford Square, London W.C.—[ADVT.]

TO ANGLERS.—W. J. Cummins, Fishing Tackle Maker, Bishop Auckland, is now prepared to forward to anglers his Illustrated Catalogue, which is not only a Trade List but is interspersed with practical hints, useful directions, and valuable information gathered by the river-side from twenty years' experience. The stock consists of his unrivalled Salmon, Trout, Grayling, and Pike Rods, Lines, Reels, Baskets, Artificial Baits, Fly-books, Landing Nets, Gaffs, and last, but not least, his celebrated Trout Flies, which for killing powers stand unequalled. Every article kept in stock is of the very best description.—[ADVT.]

Mrs. F. Y. BROCAS, Artificial Fly Dresser, 4, Mill-street, Conduit-street, Hanover-square, London, W. A stock of best flies always on hand. Flies made to pattern. Lessons in fly making given.—[ADVT.]

"OUR TRAWL."

UNDER this heading it is in future proposed to give the readers of the FISHING GAZETTE early and regular notice of the newest publications bearing on Ichthyology, Pisciculture, Angling, Fisheries, Fishery Legislation and other allied subjects, with a hope that the Full Title-List, which will be issued from time to time, will commend itself to them as a time-saving and useful addition to these columns and, as such, meet with their welcome and approval. To prevent possible misconception, it is perhaps well to hint that the projected List is by no means intended to supersede the usual Book Notices and Reviews; on the contrary, these will, as heretofore continue to occupy their accustomed position. Suffice, then, to declare that "OUR TRAWL" is solely designed to sweep the vast sea of modern literature in all the better known languages and with discriminating ardour to enmesh the most worthy piscatorial productions; to bring its catch to market at regular intervals, and to display, price, and when needful, label each captured specimen with the briefest of explanatory notes.

BUCKLAND, FRANK.—Natural History of British Fishes. New and enlarged edition. S.P.C.K., 1881. Post 8vo. pp. 432. 5s.

DAY, FRANCIS, F.L.S., F.Z.S.—The Fishes of Great Britain and Ireland; being a Natural History of such as are known to inhabit the Seas and fresh Waters of the British Isles, including Remarks on their economic Uses and various Modes of Capture. A table compiled from official sources, showing the total catch of every Dutch fishing boat employed in the herring fisheries during 1880.

CORRESPONDENCE.

[We do not hold ourselves responsible for opinions expressed by our Correspondents.]

ANSWERS TO CORRESPONDENTS.

T. ALLMAN (463, Oxford Street).—You can get Mr. T. Ford's book by writing direct to him at Caistor, Lincolnshire; and Mr. T. W. Aldham's book by writing direct to him at Winchester.

FISHING IN THE UNITED STATES.

Will G. H., who sent a query respecting the above, please send us his address again?—[ED. F. G.]

WHOLESALE DESTRUCTION OF PERCH.

SIR,—Passing through Leather Lane, Holborn, last night, March 8, I saw exposed for sale some hundreds of perch, about 3 bushels, numbers of them under size. They may have come from the Thames ditches, as the fish in last Sunday's floods were making up; but no matter where they came from, I think it clearly shows the Mundella Act should be altered at once and made at least six months against the nets. No wonder anglers and punt men grumble as the Act is entirely against them; and the fish are taken out just before the close, a nice finish to so bad a season.—I am, &c., F. M.

ANGLING CLUB NEAR CROYDON.

SIR,—Could any of your readers recommend me a good angling club near Croydon for good jack, perch and roach fishing? If so should be extremely obliged.—I am, &c., ESOS.

FISHING IN THE RODING.

SIR,—Will some reader of the FISHING GAZETTE kindly inform me if there is any trout fishing in the River Roding, say between Woodford and Abridge, Essex; and if not, whether any one would be allowed to angle for coarse fish in the close season, provided they have leave from a farm tenant whose land adjoins the river?—I am, &c., MERLIN.

LARKHALL ANGLING SOCIETY.

SIR,—I am extremely sorry to think I should have given any offence in publishing those two reports referred to in last week's GAZETTE, but I hereby apologise, and I hope you will take it as such. As for casting a slur on those gentlemen who were elected on Wednesday, I can assure you I had no intention of doing such a mean thing as that. I merely spoke about the black-balling; not that I knew anything about it myself, but heard so from several gentlemen whose names I do not wish to publish. I think it was stated that the Dabchick had flown, but you see he has again settled down in his nest.—I am, &c., W. H. DABCHICK.

LIVERPOOL ANGLING ASSOCIATION.

SIR,—In reply to the wish expressed by "Birkenhead" in your last week's issue, I beg to enclose one of our circular cards, and shall be glad if you will kindly publish as much of it as you think fit in this week's edition of the FISHING GAZETTE.

I sent you a copy of our rules some short time ago.—I am, &c.,
Liverpool, March 7th, 1881. R. WOOLFAH, Hon. Sec.

LIVERPOOL ANGLING ASSOCIATION.

Patrons: Right Hon. Earl of Lathom, Right Hon. Lord Sandon, M.P., Earl of Dalhousie, Sir R. A. Cross, M.P., Colonel J. Ireland Blackburne, M.P., E. Whiteley, Esq., M.P., W. Rathbone, Esq., M.P., T. Weld Blundell, Esq., J. W. Crompton, Esq. President: T. Davis, Esq. Vice-President: W. Woolfall, Esq. Treasurer: Mr. W. Jones. Hon. Secretary: Mr. R. Woolfall.

The Liverpool Angling Association has been established for the purpose of promoting fair and legitimate angling amongst the disciples of the "gentle art," and of acquiring, by renting or otherwise, sheets of water within a reasonable distance of the city, in which the members shall have the right of enjoying their favourite pastime. The entrance fee is fixed at 1s. 6d., and the subscription 3d. per week, which can, of course, be paid quarterly, half-yearly, or yearly in advance, at the member's option. Without doubt, it is the plain duty of every angler to join this Association without delay, and thus strengthen the hands of the executive, and enable them to compete for the renting of suitable water, the giving of good prizes, &c., &c.; and it is to be hoped that the great bulk of the followers of Isaak Walton will at once become members of the association.

The various railway companies were communicated with on the subject of reduced fares, and the London and North-Western, Lancashire and Yorkshire Great Western, and Midland have granted to members, on the production of their membership cards, the privilege of travelling, when on fishing bent, to various good fishing stations on their lines at about a fare and a quarter for the double journey, covering three days. A printed card of the stations and fares will be given to each member on payment of the cost price.

No fish to be weighed for prizes of less than the following weights:—Pike, 4 lb.; jack, 1 lb.; perch, 3 oz.; trout, 4 oz.; grayling, 4 oz.; barbel, 1 lb.; bream, 6 oz.; chub, 8 oz.; carp and tench, 4 oz.; roach, including rud, 2 oz.; and dace, including graining, 2 oz. Gudgeon, poise, or bleak not to be restricted to weight. Eels not to be classed as fish, and not to be weighed-in to any member.

The association hold their meetings weekly, at half-past eight each Thursday evening, at the Strawberry Hotel, West Derby Road, Liverpool, and the members will have much pleasure in welcoming every angler at these meetings, at which also any further information will be given, items of fishing discussed, excursions arranged, and matters of personal interest to the craft generally ventilated.

STOCKING A POND.

SIR,—Would any subscriber kindly tell me—Firstly, whether trout would be likely to thrive in a pond 370 feet by 130 feet, depth from 30 to 5 feet;

secondly, what other kinds of fish would be likely to flourish, and where same may be bought in small quantities; and thirdly, a few hints as to the time when they should be put in the pond. Three years ago the pond was full of tench, but of late the fish have diminished owing, I fancy, to a few pike that must have been left in on the clearing out of the pond for the purpose of destroying American weed, which grows rapidly.—I am, &c., EAST SUSSEX.

[Put trout in if a stream runs in and out, if not put roach, perch, carp, &c. Now would be a good time, better than in the hot weather, as the fish will not stand removal so well then.—ED.]

YARE PRESERVATION SOCIETY.

President: G. F. Buxton, Esq.; Vice-President: E. Birkbeck, Esq., M.P.

DEAR SIR,—The annual meeting of the above will be held at the Bell Hotel, on Tuesday evening, March 15th, at 8.30 o'clock. Your attendance will oblige.—Yours respectfully, C. J. GREEN, hon. sec.
London Street, Norwich.

BUSINESS.

"To adopt the accounts for the past year."
"Election of officers for the ensuing twelve months; appoint day and place for the annual dinner, and other important business."
"To consider the future grant of £10 to the Bure Society."

"THE FISHERMAN'S MAGAZINE."

SIR,—Can any of your readers inform me, through your GAZETTE, if there is such a paper as the *Fisherman's Magazine and Review*, and, if so, where it is published? By doing so they will greatly oblige
March 9, BLUE DUN.
[The above magazine expired some years ago.—ED.]

A LIVERPOOL CLUB.

SIR,—Your correspondent "Birkenhead" may find the Liverpool Angling Association to his taste.

Any communications addressed to the Secretary, Strawberry Hotel, West Derby Road, Liverpool, will be courteously responded to.—I am, &c.
Oakfield Villa, Grant Road, Knotty Ash, Liverpool. JAS. WILKINSON.

HOW TO PRESERVE DEAD MINNOWS.

SIR,—Can you or any of your subscribers to the FISHING GAZETTE inform me how to preserve dead minnows for a month or more, so they will be tough and bright to use for trout spinning? L. FISHER.
Flemington, New Jersey, U.S.A.

[In the north of England they adopt this plan. Take a stone jar and put the minnows into it with dry moss, sprinkle salt and shake them up loosely; they keep a long time and are tough and bright, though, as the salt shrinks them, a larger size should be salted than would be necessary if used fresh.—ED.]

CLUB REPORTS.

WEST CENTRAL ASSOCIATION.

[Mr. Hoole asks us to insert the following notice to Delegates.—ED.]

SIR,—Will you please instruct your delegates to attend our meeting on the 18th inst. I shall have important information to give them in reference to extra railway concessions gained by the Association. If you want tickets of admission please apply to me. Send me corrections for new list of clubs at once, please.—I am, &c., J. HOOLE, hon. sec.

BATTERSEA PISCATORIAL SOCIETY.

The successful competition of Sunday last for prizes given by Messrs. Newman and R. A. Banfield were Messrs. Banfield and Greener. It is arranged to compete for prizes given by Sir Trevor Lawrence, Bart., M.P., and two other gentlemen on Sunday next; but I am afraid we shall not be able to fish unless the water is in a better condition.—C. NEWMAN, hon. sec.

CITY OF LONDON ANGLING SOCIETY.

One member only has weighed-in fish—Mr. Castellon the 27th, roach from the Lea and Stort, and on the 6th roach from Watford. We fish on Sunday next for six prizes.—CAS.

CLAPHAM JUNCTION ANGLING CLUB.

The members fish for the remaining prizes on 13th (Sunday), hoping all members will show up in strong force, as it being the last of the season, requesting all members to attend on Thursday next, for important business to do.—E. WILSON.

DALSTON ANGLING SOCIETY.

The members of the above society competed on the 6th inst. in a pegged-down match at King's Langley for eight valuable prizes. The competition was highly successful, every member getting fish. The following gentlemen were the winners in the order named:—Messrs. H. Anderson, J. Bunn, J. Claydon, W. Richardson, W. Lester, W. Warman, T. Midson and F. James. Messrs. Eagles and Fortescue, who did not fish in the match, brought up some fine roach from the Lea, the first-named having 9 lb. and Mr. Fortescue 5 lb.—W. L.

EDMONTON AND TOTTENHAM ANGLING SOCIETY.

Our members were out in force on Sunday, but our show was poor—most of the jack fishermen having to content themselves with a run up and down the bank to keep their blood in circulation. Mr. B. Lowin took first honours (a

handsome case of stuffed birds, presented by Mr. Biscoe, of Fetter Lane) with a brace of small jack. Mr. G. Stevens was only one behind with a few fine roach from the Lea, and took Mr. Rider Burrows' telescope. Mr. W. Selwood took a 2 lb. jack legering with a worm. I hope to give you a more glowing account of our doings on the 13th, when we fish for a sweepstake before laying by our tackle for a long three months.—D. G. MUNRO, sec.

EUSTONIAN ANGLING SOCIETY.

On Sunday last we fished for seven prizes, at Tagg's Island, but, owing to the high state of the water, only five were won. Mr. Hornfeck taking first prize; Mr. Coster, second; Mr. Meek, third; Mr. Lawrence, fourth; Mr. Stedman, five. The other two prizes will be fished for on Sunday next.—W. COSTER.

March 9.

GOLDEN BARBEL.

On Sunday last, the 6th, Mr. J. Green and "Midshipmite Lumley" received a moist reception from "Father Thames," under the following circumstances. Mr. Green and "The Midshipmite" were fishing in the neighbourhood of Maidenhead, Mr. Green on the bank and "The Mite" in a boat. By some means or other the boat got into the stream, the current of which was too strong for him, and he was soon carried towards the weir. Finding he had no control over the boat, he lost his presence of mind and jumped in the river, where, but for the timely assistance of Mr. T. Green, he would have made food for those that he wished to make food of. In the meantime the boat drifted on, and fortunately the wind caught it and drove it into some bushes, from whence it was rescued by Mr. Green, who placed in it the now limp "Midshipmite," and pulled to the first house he could get to, where, with the kind assistance of the worthy host, they took possession of a bed until their clothes were dry enough to put on. At the time of writing neither "The Gallant Commodore" nor "The Midshipmite" seem any the worse for their moist reception. The under-mentioned gentlemen exhibited fish in the clubroom the same evening:—Mr. H. Harrison, 12 lb. 14 oz. roach and perch; Mr. E. Harrison, roach; Mr. T. Bigsby, roach; Mr. J. Green, roach and dace; Mr. Lumley, roach; Mr. J. Stanton, barbel; Mr. Hornfeck, barbel; Mr. C. Wood, roach; and Mr. T. Lee, roach. The gross weight going over 40 lb. The above gentlemen visited the following places:—Pangbourne, Marlow, Taplow, Maidenhead, Henley, Walton, and Harefield. On Sunday next a grand contest will take place for some useful prizes.—PIXIE.

March 9, 1881.

GOLDEN TENCH ANGLING CLUB.

Owing to the state of the rivers the show at our club on Sunday was very small. The river Lea was out in full force. Miles of land were under water, but Mr. Higby had one jack from the Grand Junction Canal weighing 3 lb. Mr. Brown had some nice roach from the same place. Mr. Webb, fishing with two friends at St. Margaret's, took six roach, weighing 2 lb. 14 oz.—T. S. WEBB.

March 8, 1881.

GREAT NORTHERN BROTHERS.

We had a very fine show of fish on Sunday last. From the Thames; Mr. F. Watling, 4 lb. 7 oz. roach; Mr. Young, 1 lb. 8 oz.; Mr. J. K. Fitch, 2 lb. 2 oz. Mr. Theobald 5 lb. 14 oz., including two fine perch, one weighing 1 lb. 7½ oz. From the Grand Junction Canal: Mr. Phillips, 2 lb. 10 oz. roach; Mr. J. Smith, 1 lb. 11 oz. roach; Mr. J. Fitch, one jack, 2 lb.; Mr. Parkin, 1 lb. 4 oz. roach, total 22 lb. 4 oz. The members will do their utmost on Tuesday next to obtain a good show of fish for the last day of weighing. A large number of prizes will be fished for.—J. FITCH, sec.

March 8.

IZAAK WALTON ANGLING SOCIETY.

The shows of fish have not been very large lately, but still the members are deserving of the same amount of praise for their perseverance. Several of them were out on Sunday last, 6th inst., and only three had takes of any note, they were Messrs. G. Manning, E. Morrow, and B. Crook. Messrs. A. C. Critchfield and J. W. Morgan had a grand show of pike this day (Wednesday), the total weighed over 1 cwt., the largest weighed 15 lb. Mr. A. Salmon had roach; Mr. T. Dennison, senr., had perch. There are two more prizes to be added to the two announced for Sunday next, 13th inst. The list of prizes will be as follows:—A chimney glass, value £2 2s., given by Mr. A. E. Bedford; "An Angler's Companion," value £1 1s., given by Mr. C. Hambridge; ros. 6d., given by Mr. G. Wood; ros. 6d., given by Mr. A. Salmon. Conditions—All fish weighed in accordance with the rules of the society; members to choose their own fishing water; no competitor to leave Lond on before 5 a.m. on the morning of the competition. A resolution has been passed, that as there will be very little business during the fence months, the members beguile the dull time away with harmony, to which they can invite their friends.

March 9.

LARK HALL ANGLING SOCIETY.

The annual dinner of the society is fixed for Tuesday, March 22nd. Tickets will be sent to the members shortly, and as a very large number is expected, it is earnestly requested that those members who wish to bring friends, make early application for tickets, either by letter or personally, to Mr. W. Tucker, the hon. sec., at the club house. The shows of fish lately have been very poor, the only one worth reporting being that of Mr. G. Watkins, on Sunday last, viz., 11 lb. 9 oz. roach, and 4 lb. 3 oz. perch.—VERITAS.

March 8.

LITTLE INDEPENDENT ANGLING SOCIETY.

On Sunday, taking it altogether, we could not complain of the appearance on our trays. Mr. Scott, 3 lb. 8 oz. roach; Mr. Mead, 1 lb. 12 oz. roach; Mr. Humphreys, 1 lb. 10 oz. roach; Mr. Pipe, 1 lb. 6 oz. roach; Mr. Hurwood, 1 lb. 1 oz. roach and gudgeon; Messrs. Petrie and Wrighton, dace. Mr. E. Barr wishes to thank brother anglers for the grand reception he met to his call on Monday night.—W. BROWN, hon. sec.

March 9.

NORTH-WESTERN ANGLING CLUB.

Mr. Hillier, of this society, succeeded on the 6th inst. in showing some splendid bream and roach, one of the former going 5 lb. 8 oz.—Messrs. Bonvoison and Marshall having roach from the canal, and Mr. Fred Forman jack from Elstree.

THE NORWICH ANGLING CLUB.

The general meeting of the above club was held at the club-house on Monday evening last, when Mr. Gunn, the celebrated naturalist, read a very interesting and instructive paper on "The Freshwater Fish of England." There was a good attendance of members.—ANGLER.

RICHMOND PISCATORIAL SOCIETY.

There was a good attendance of members at the weekly meeting on Wednesday evening last, in the Club Room, Station Hotel, Richmond. In the absence of Mr. F. C. Clench, who had not returned from Scotland, the chair was worthily occupied by Mr. Owen Davis. Mr. J. H. Gaunt, the energetic honorary secretary, read letters from Sir Henry W. Peek, Bart., M.P., and Sir Trevor Lawrence, M.P., both accepting the office of vice-president, and the latter enclosing a cheque for one guinea to be given as a prize at the discretion of the members. This is another good movement in the increasing popularity of the society, which bids fair to become a large suburban club. Mr. W. H. Brougham was then called upon by the chairman to offer some remarks on the Thames, and who referred principally to the safe passage this season of the dace. Not relying on local assistance, two of the wholly-paid keepers of the T.A.P.S., in union with the police, had been watching the river night and day. There was a large body of dace at Twickenham, where, owing to the cold weather, they doubtless remained, and it was desirable they should be protected from the net, but they had with the milder weather headed up, and the anxiety for their safety had subsided. He reminded the members of Monday next being the closing day of the angling session, and referred especially to the prohibition of the sale of freshwater fish during the fence period, which was in reality the best part of the Freshwater Fishing Act of 1878. In concluding, Mr. Brougham hoped the time had now come when the Richmond Piscatorials were in a position to subscribe to the T.A.P.S., as both had been working together, and assured those present that any suggestions from their society, with its position on the Thames, would have great weight with his committee. Mr. Little at once proposed that the Richmond Piscatorial Society subscribe one guinea annually to the T.A.P.S., and said he should be happy to do the same himself. Mr. J. Munro seconded the proposition, and it was unanimously carried. The remainder of the evening was occupied in arranging for a show of fish specimens from the society, at the exhibition in Richmond, in April, and concluded with hearty votes of thanks to Mr. W. H. Brougham for his attendance, and to Mr. Owen Davis for his admirable conduct in the chair. It is evident from Mr. Munro's personal attention to the comforts of the Richmond Piscatorials he has made them his chief study, and the anglers ought to support him.—B.

ROYAL PISCATORIALS.

On Thursday, the 3rd inst., Mr. T. Hughes had another turn among the jack, and succeeded in taking three very handsome fish, weighing 53 lb. (one 22 lb., and 17 lb. and one 14 lb.) On Saturday he was again in "luck's way," getting this time four jack—the heaviest going 17 lb. The prize competition which took place on Sunday, the 6th, came off in favour of Mr. F. Dale and Mr. H. Smithers, with roach and dace from the Thames; other waters refusing to contribute on this occasion, although earnestly solicited by various members of the society.—PIXIE.

March 8.

ST. JOHN'S.

We had a complimentary visit paid to this society on Monday evening, March 7. Fourteen clubs were represented, most of them by large numbers of their members, so we had a first-class house full. Some first-class songs were sung by the following gentlemen:—Therling, Stevens, Fowler; Mr. Rayment of the Star, gave us two readings, "The Accursed One," and a selection from "Richard the Third;" Mr. Bell, "The Chase;" Messrs. Vanigan, Leach Brown, Hall, Turner, of the Clerkenwell Piscatorials, Batten, Lea, Lewis, Casey, J. Roberts, and Gersutch. We had some first-rate talent in the room, but had not time for all to sing, so at 12.30 we separated, having enjoyed a very pleasant evening.—F. F.

March 10.

SIR HUGH MYDDELTON ANGLING SOCIETY.

The handsome oil-painting—subject, freshwater fish (by Wolfe), the property of an old angler and club member—is now on view at the above house, and will be drawn for on the art-union principle. Tickets, 1s. each, to be had of the secretaries of angling clubs and fishing-houses. As a wind-up for the season, the members of the above society intend fishing a match for a series of club prizes at Shiplake on Sunday morning, 13th inst. The result will appear in next week's *Gazette*.—J. CABORN, sec.

March 7.

SOCIAL BROTHERS ANGLING CLUB.

Taken at Pangbourne on the 6th of March on bank, by Mr. H. Freeman, 8 lb. 5 oz. roach.—J. R. PAVEY.

March 7, 1881.

SURREY PISCATORIALS.

The result of the competition which took place on Thursday the 10th, is as follows:—First, Mr. Beckett, perch and roach, 8 lb. 8 oz., £2 2s., given by Mr. Peters; second, Mr. Pugh, perch and roach, 6 lb. 5 oz., rod given by Mr. Weekly; third, Mr. Bansback, chub and perch, 6 lb. 2 oz., £1 1s. given by Mr. Clarke; fourth, Mr. Murray, roach and dace, 4 lb. 8 oz., waterproof coat given by Mr. Turner; fifth, Mr. Hayward, dace, book of tackle given by Mr. Medway; sixth, Mr. Duck, bream, roach and dace, £1 1s. given by Mr. Beckett; seventh, Mr. Boalch, dace and roach, leggings, given by Mr. Linstead. Some of the chub and perch weighed nearly 2 lb. each, and the gross weight of all fish about 50 lb., all taken from the bank. Mr. Pugh exhibited three jack that he caught at Henley on Wednesday. The attention of those members who were

not present this evening is called to the following notice:—"In consequence of the inability of several members to attend, the general meeting called for on the 17th, is postponed until the 24th.—PIXIE.

March 10.

THE STANLEY ANGLERS.

I have very much pleasure in sending you the report of fish caught by our members this week, and hope to be able to give you another before the end of the fishing season, as I hear that several members are going to have another try before that time. Our president, Mr. C. P. Wheatstone, has had 4 lb. roach, and 1 lb. 8 oz. perch; Mr. J. Duncan has had a beautiful take of roach weighing 24 lb. 5 oz., and one dace, weighing 9½ oz. Four of the roach weighed over 1 lb., the largest weighed 1 lb. 6½ oz., the remainder were all good sized fish. Mr. Gow has also had a very good take, having been successful in capturing 7 lb. 4 oz., jack, 6 lb. 14½ oz. perch, 4 lb. 13½ oz. roach, 4 lb. 4½ oz. of chub. Some of the roach and perch were very good specimens. Mr. G. Walker, fishing in private water, through the kindness of our president, captured 2 lb. 2½ oz. jack, 5 lb. 8½ oz. perch, and 2 lb. 12 oz. of roach; the perch and roach were all good specimens, the largest perch weighed 2 lb. 8 oz., and was a handsome fish. He is having it preserved. Mr. W. R. Humby had 3 lb. 6½ oz. roach and 7½ oz. of perch; Mr. Rose 3 lb. 1½ oz. roach, and 9 oz. of perch, and Mr. D. M. Humby had a nice show of roach and perch. The last three gentlemen are honorary members, and I hope their example will be followed by several others. Apologising for the length of this report.—C. LAWLER, hon. sec.

March 10.

STOKE NEWINGTON ANGLING SOCIETY.

On the 6th inst. Messrs. Gretton and North had another attempt to obtain a show of fish, but with the water the colour of clay, running like a mill race, and in places entirely submerging the towpath, it is little to be wondered at that the result was anything but satisfactory. Mr. Ed. North having 14¾ oz. roach, and yours obediently 1 lb. 13¾ oz. roach.—THOS. GRETTON.

March 8.

TUNBRIDGE ANGLING CLUB.

On Wednesday last the members of the above club, by the kindness of Mr. Lewin White, dragged a pond at Ightham, in the estate of Edward Cazalet, Esq., for the purpose of securing stock carp for the Medway fishery. The pond proved most prolific, for although 1041 fine stock fish were taken out, plenty were left in the pond to stock it again. The fish were afterwards put in the preserve waters of the Club.—YE MEDWAY WATER RAT.

March 10.

TUNBRIDGE ANGLING CLUB AND FISH PRESERVATION SOCIETY.

The sixth annual meeting of the above society was held on Tuesday evening, March 3rd, at the Bull Hotel, Tunbridge, when Mr. T. Elliott, of Tunbridge Wells, presided, and there were also present—Messrs. E. Greenwood, R. A. Dallas, Beeching, W. J. Parker, F. Rawley, J. Snelling, E. Plowright, T. Seabrook, C. Williams, A. J. Snelling, W. Stander, C. Payne, G. Payne, F. Chalklin, F. W. Hancock, J. Buley, Q. Austin, J. Eller, W. Flood, W. A. Kirby, T. M. Dove, E. Hollomby (hon. sec.), &c. The annual report stated that the operations of the society had been very successful, as netting was almost, if not entirely, done away in the district. We preserved the Medway and its tributary streams from Ensfield Bridge on Lord D'Liste and Dudley's Estate, near Penshurst to Ensfield Bridge, near East Peckham, some six miles. This combined with the precautionary measures taken during the spawning season had led to a great improvement in the fish and river, both in regard to the size and quantity of fish. Besides this, owing to the kindness of gentlemen in the neighbourhood, various ponds had been dragged by the committee, and the result has been that 1000 tench and 30 brace of good carp have been placed in the river, thus improving the fishery and the resources of the river. The committee appealed to other gentlemen in the neighbourhood to allow them to drag any streams or ponds they may have to obtain store fish for the river. They regretted that owing to the rain and consequent floods, the fishing had not been so good as the committee could have wished for; but, notwithstanding this, some good catches of jack, perch, bream, roach, chub, tench, and carp had been made. They believed that if the weather next season prove at all successful, sport will be everything that can be desired. The accounts showed a deficiency of between £7 to £8, but this the secretary explained was due, in a great measure, to the fact that extra expense had to be incurred for the purchase of otter traps, &c., which would not occur again. The Chairman, in a long and interesting speech, moved the adoption of the report and balance-sheet, which was carried. The following officers were then elected:—W. Gorham, Esq., president; A. T. Beeching, Esq., treasurer; Mr. E. Plowright, auditor; Mr. E. Hollomby, hon. sec.; the Hon. Henry Roper Curzon; Messrs. R. A. Dallas, Beeching, J. Buley, T. M. Dove, M. A. H. Edwards, T. Elliott, J. Le Fleming, G. Gray, E. Greenwood, F. W. Hancock, C. Payne, G. Punnett, J. Snelling, R. Ware, W. A. Kirby and F. Chalklin. James Foster, the water bailiff to the society, was re-elected. Some discussion took place with reference to the formation of a weighing-in club in connection with the society. It was eventually unanimously resolved to ask the committee to take the matter up and report before the season opens in June.—MEDWAY WATER RAT.

WALTONIAN ANGLING SOCIETY.

On Wednesday last, Mr. Phillips again to the fore, with over 15 lb. On Sunday last the same gentleman's take was over 11 lb. Mr. Packman also weighed in roach.—A. J. MARRIOTT.

March 7, 1881.

WALWORTH WALTONIANS.

The competition which took place on Sunday, the 6th inst., among the members of the above society was an exciting one, some twenty members being allowed to go where they liked. The Lea, the Colne and the Thames were visited, and courted most patiently with hopes of being induced to supply fish sufficient to win the various prizes. "Father Thames," who secured the greatest number of suitors was, on this occasion, like ladies sometimes are—very hard to please, but after a deal of coaxing this way and that way, Messrs. Delahaye, Weatherhead, Beale, Renault, Bedford, Cain, Boalch and Brown

succeeded in wheedling out of the "mud-sick gentleman" some roach, dace, perch and bream. Mr. Bayley had some perch from the Lea. All the fish were exhibited in the club-room during the evening, and at 10.45 the prize-winners were named, among whom were Mr. S. J. Weatherhead, the winner of Mr. Brown's writing-desk. On the 11th a competition will take place for a series of prizes, the first being £3 3s. given by Mr. James Collins, the second £2 2s., given by Mr. J. Frith.—PIXIE.

March 9.

A FISHERIES EXHIBITION IN EDINBURGH.

WE are glad to see that the interest in fish and fishing is increasing so wonderfully in this country, and here is what our Scotch friends think on the subject:—"Why should we not have a Fisheries Exhibition in Edinburgh in the course of next winter or spring? Not long since there was a brilliant and successful Fisheries Exhibition in Berlin; and in April next there is to be one at Norwich. We understand that, in that city, during the last few weeks, the applications for space by intending exhibitors have been so numerous that the committee have been compelled to change the site for the exhibition from St. Andrew's Hall to the Drill Hall, a large and commodious building, and that the city corporation have granted the committee leave to erect a large temporary structure as an addition in Chapel Field Gardens. The Norwich Exhibition is to be held, the advertisements inform us, under Royal patronage and State recognition; and special prizes are to be given for apparatus connected with, and illustrative of, pisciculture; and for essays on the subject; for models of fishing-boats used in trawling and drifting; for models of fish-curing establishments and improved fishermen's dwellings; for specimens of stuffed fish; collections of tackle used in sea-fishing and for fishing in inland waters, &c. Then there are also to be prizes for essays on the cultivation of oysters, mussels, and other shell fish; on the salmon disease; on the parasitic and other diseases of fish not belonging to the salmon species; on fishing legislation; and on a variety of cognate subjects. In addition to all this, the Government has promised to award gold, silver, and bronze medals, and diplomas of honour, to the successful exhibitors.

It is impossible to doubt that exhibitions of this kind must tend to foster and develop the fisheries, by stimulating thought and enterprise, and by concentrating in one spot, open to public inspection, all the improvements of modern science which have any bearing on one of our chief national industries. Therefore, why should we not, following the example of Berlin and Norwich, hold a Fishery Exhibition next year in Edinburgh, in order to illustrate and encourage the fisheries of Scotland? They are more valuable than those of England, and vastly more so than those of the German Empire; and, owing to the great extent of the Scottish seaboard, and the number and importance of the neighbouring islands, whose shores are washed by seas teeming with fish, they are susceptible of a much greater expansion. With, perhaps, the single exception of the Norwegian herring fishery, the herring fishery of Scotland is the most important fishing industry in Europe, its total value being not much under £3,000,000 a year. The average annual value of the herring brought into the stations on the coast of Aberdeenshire alone is equal to the whole land rental of the county. In this case, aquiculture is at least as valuable as agriculture. In 1876, the number of boats fishing at the Aberdeenshire stations was 2,098, manned by 12,000 men and boys. The value of the property involved in their safety amounted to £630,000; and they afforded employment to 10,500 persons on shore. Surely this great herring fishery is an industry worth encouraging; and it might be immensely expanded by improved harbour accommodation on the east and north coasts, by an extension of telegraphic communication in the Outer Hebrides and the Orkney Islands, and by having the sounds in the last-named islands better buoyed and beacons than they are at present. Then, besides the herring fishery, there is the extensive and valuable fishery for cod and ling most successfully prosecuted in the Orkney and Shetland Islands; for haddocks, whittings, flounders, &c.; for mussels, oysters, crabs, and lobsters; all of which might be greatly increased and improved. Last, though not least, come our salmon fisheries; worth about £300,000 a year; but which might be immensely increased in value under a wiser system of legislation and better management.

There is, in short, ample scope and much need for a Fisheries Exhibition in Edinburgh to illustrate and to encourage our fisheries, and to prove to the general public how important they are to our national wealth and well-being. The recently-formed Scotch Fisheries Improvement Association, which already numbers upwards of 100 life members, might most naturally and appropriately take up the matter, and by this time next year everything might be arranged. No city in Great Britain could have a more central or spacious place for such an exhibition than the Waverley Market presents. It would afford ample room for a crowd of exhibitors and great facilities for the sight-seeing public."—*Scotsman*.

ANOTHER otter (the fourth this winter) was trapped in the Titchfield Club water last Wednesday by Mr. H. P. Delme's keeper. It was a fine old dog, weighing 21½ lb. Having read the article, in your last week's number, on "Otters, and How to Catch Them," I will tell you of a plan communicated to me by a keeper, who caught three in a very short time, after having tried for some months unsuccessfully. He found that otters frequented a pool above which were some hatches that would pen the water back for a short time. Having ascertained their landing-places, he shut down the hatches, and set his traps between high and low water mark, and then turned on the water, with the above result. His idea was that the otters detected his footsteps and scent as keenly as he did theirs; but, by letting on the water, his traces were covered.—RED PALMER.

CHUB.

THERE is no better bait in cold weather for big chub, in the Kennet than the middling-sized lob-worm, well scoured. Mr. Bailey, the noted Nottingham angler, recommends, I believe, a small portion only of a lob for fishing; but a hungry chub will greedily bite at a lob-worm not quite of the largest size. Bread and good fat cheese (mixed) is an excellent lure in summer, and so are the smaller sort of chafer that in some seasons abound about haymaking time. In fact, no deadlier bait exists—not even the fattest May fly. The best of all gentles are those from tallow-chandlers' fat tubs; but ordinary tallow-chandling has been almost superseded by oil and lamps. The caddis bait abounds in the Kennet, and especially in the smaller watercourses in the valley.

OLD ANGLER.

THE SALMON FISHING SEASON.

ALTHOUGH most people are unaware of it, the larger proportion of the salmon consumed in England are captured in the rivers of Ireland. Selecting a couple of years at random, it appears from the figures furnished by the official inspectors of the Irish fisheries that in 1878 44,637½ boxes of salmon, each containing 150 lb., were exported to various towns in England; while in the preceding year the number of boxes was 47,934, the money value of which would not be far under £450,000. No official statistics of the Scottish salmon supplies are collected; but the value of fish taken from Scotch waters cannot be estimated at a larger sum than £300,000—the value of the salmon taken in English waters being little more than a third of that amount; and it is not possible by any manipulation of figures to bring up the annual value of the British salmon fisheries to £1,000,000. As regards the Scottish salmon fisheries, which are all private property, the rentals of the various rivers are well known; and, since the yield of fish, to pay wages and other expenses, requires to be about three times the amount of the rent, it is at once apparent that the value of the salmon taken in the Tay and Tweed must be nearly £100,000 a year, leaving the remainder of the sum total to be made up by the numerous salmon streams of less magnitude which abound in Scotland. With prices high, it does not require a very large number of fish to make up the total sum indicated. A fine specimen of Tay salmon, weighing some 30 lb., is of more value in the London season than a "prime" Southdown sheep. During the present month the wholesale price of salmon at Billingsgate has not been less than 2s. 6d. per lb.; while in the retail fish-shops it has been selling at from 4s. to 7s. 6d., and in some years it has been even dearer. As the rivers come into season, and larger quantities are supplied, prices may fall a little; but it is only on rare occasions that good salmon can be obtained at a less price than one shilling a pound weight, and there is little chance that it will ever be cheaper. The late Mr. Buckland was at one time fond of predicting that we should yet have salmon at under sixpence a pound; for although we should double the supply during the present year, the existing scale of prices would scarcely be affected, so great has become the demand for the fish.

So far as the supplies obtained during this season can at present be estimated, salmon fishing has not had a favourable beginning—in consequence, no doubt, of the severity of the weather. At the opening of the Tay fisheries, on the 5th of February, very few fish

were taken even on the most productive "shots;" on some of them not even one salmon was obtained; and the short supply still continues. On many of the English rivers salmon fishing will not begin till next month, while on some of them the commencement of salmon fishing is timed to begin so late as the 1st of May. In Scotland the salmon close time is over, as a general rule, in all the salmon streams by the end of this month; but on one or two of them rod-fishing has been legal since the 12th. On one of the Irish streams the angler has been at work since the first day of the year; and from the 1st of February the majority of Irish streams have been open to rod-fishers. A few of the Irish rivers, however, do not open till March, and there is one on which it is not legal to cast a fly till the first day of June; but that river only closes about the usual time, the commencement of the close season for nets being fixed for the 15th of September, and for rods on the 31st of October. Net-fishing in Irish waters, however, ceases pretty generally by the end of August; the rods on some rivers being allowed in certain instances to continue to the 1st of November. The Tweed is open for rod-fishing till the 1st of December; at all events it is timed to close on the 30th of November. Thus, with the Bundrows in Ireland opening on the 1st of January, we are within one month of having British salmon all the year round, the interval being in the meantime filled up with supplies of Canadian, Norwegian, and Rhenish fish. That we could have fine salmon all the year round from our own waters has often been shown. On the occasion of capturing salmon on the Tay and its tributaries for the supply of the Stormontfield Salmon Nursery with ova, a considerable percentage of fine clean fish are always taken; and some years ago, while Mr. Buckland was on a salmon-spawn mission on certain tributaries of the Firth of Forth to obtain eggs for New Zealand, he assisted in capturing a large number of clean fish which were undoubtedly fit for food. Mr. Buckland, indeed, was of opinion that as a rule salmon did not spawn every year, and that in consequence there was always a large number of fine healthy fish to be obtained during all seasons.

That the annual close time which has been fixed for our salmon rivers has, roundly speaking, proved of advantage to the fisheries scarcely admits of doubt; but the time has arrived, perhaps, when some modifications of hard-and-fast lines might be devised. The "run" of the fish is undoubtedly largely dependent upon what may be called "weather influences"; and it would only be justice to those interested in the fisheries to extend, in some instances at least, the open season by from ten to twenty days: the number of days of the close season need not be diminished in consequence, since the date of the next opening could be delayed by the same period. No harm would ensue to the fisheries so regulated; because all salmon are taken alive, and an unhealthy or gravid fish could be at once restored to the water. It is estimated—and on some of our salmon streams it is quite possible to form an estimate—that a very large amount of salmon ova was deposited in November and December last; and if the spawning-beds have not been greatly disturbed by the ice and floods of the winter-time, there should in the course of the next three months be a plentiful show of salmon fry. It will be two or three years, however, before these can be counted on as eatable fish. In the meantime, it may be hoped, for the present season, since "a bad beginning has often a good ending," that the salmon supply will be an average one, both as to numbers and the weight of individual fish.

—*St. James's Gazette.*

CLEVES HUNTING AND SPORTING EXHIBITION, 1881.—The Commission of this exhibition are petitioning the Emperor to award gold State medals for the exhibitors. Silver and bronze medals will be granted by the Prussian Minister of Agriculture, Domains, and Forests. Prince Frederick Charles of Prussia, the Prince of Waldeck, and the Hereditary Prince of Schamburg-Lippe will be amongst the exhibitors. The opening of the exhibition is now fixed for June 12.

SPECIAL NOTICE.

Messrs. S. ALLCOCK and CO.,

STANDARD WORKS, REDDITCH,

ARE WHOLESALE AGENTS FOR

"THE FISHING GAZETTE SPINNERS AND SPOONS;"

"THE FISHING GAZETTE KNIFE," 16 Tools in one,

"THE FISHING GAZETTE PLIERS," six Tools in one,

"THE FISHING GAZETTE LEAD," for Spinning Trace.

This Lead is now ready. It can be put on or taken off any part of the line without unfastening anything but the lead itself. It cannot slip, and it prevents the line kinking.

THE FISHING GAZETTE PICTURE OF SALMON, TROUT AND PERCH.

N.B.—TRADE ONLY SUPPLIED.

NOTICE.

—o—

Communications relating to the Literary Department, Fishing Tackle for Notice, Books for Review, &c., must be addressed to the Editor of THE FISHING GAZETTE, No. 12, Fetter Lane, London, E.C. and should reach the office not later than Tuesday morning.

Contributions are solicited, but the Editor will not undertake to return rejected MSS., unless accompanied with a stamped addressed envelope.

Correspondents are requested to write on one side of the paper only and give their real names and addresses, not necessarily as signatures to their letters, but as a guarantee of good faith. Unless this rule be adhered to no notice will be taken of such communications.

THE FISHING GAZETTE is published every Saturday, and can be obtained at Messrs. W. H. Smith and Son's Railway Bookstalls, and of the following, amongst other Fishing Tackle Dealers in London and the Provinces:—

Messrs. Alfred and Son, Moorgate-street.
Messrs. Price and Co., 8, Seymour-street, Euston-square, N.W.
Messrs. Williams and Co., Great Queen-street.
Messrs. Gee and Co., St. Andrew's-street, St. Martin's-lane.
Messrs. Gee and Co., Gray's Inn-lane (near Holborn end).
Messrs. Little and Co., Fetter-lane, E.C.

SATURDAY, MARCH 19, 1881.

EARLY FLY-FISHING FOR ROACH AND DACE.

"Of a' the airts the win' can blaw,
I dearly like the west."—BURNS.

THE long looked-for weather change, from continued cold to genial mildness, which set in a few days ago, must have been welcomed by all anglers, more especially by those who seek the

fish called "coarse." Unfortunately with the change, and westerly winds, came floods. In some parts of the country these were caused by melting snow, as well as rainfall. In our neighbourhood rain fell to such an extent as almost to extinguish the hopes of many an enthusiast who wished to have one day at least before the operation of the Mundella Act put a stop to his sport for three months and a day.

There has been a good deal of grumbling going on regarding this Act.

It is a good thing that with the fine weather the various rivers have run down and fined. How rapidly they do so, I was witness of. On Tuesday last I happened to be in Hertford; there the Lea was running bankful and very thick; at Hatfield, it was full but only cloudy. Two days after, on Thursday, at both these places it was quite clear, but still in partial flood, and on Saturday (12th) it was well run down and bright. This condition tempted me to try a beginning and ending—in one, before the Act operated—of fly-fishing for dace and roach. I chose a favourite mill stream on the upper Lea. Though the morning was hazy, it looked as if it would, like Friday, burst into brilliant sunshine, as the sun dispelled the mist, and, with such sunshine, I thought no doubt there would be a fair amount of flies on the water. I was, however, disappointed. By one o'clock I reached the river, and found that the wind had chopped round to the east—the sky so thickly lined with heavy dark clouds that no sun could pierce them, and scarcely a trace of insect life in the air, by field, tree or water. The air was genial, but no fish were rising. The day, disappointing to a fly-fisher, appeared to me to be an excellent one for those who were bottom-fishing elsewhere. There was consolation to a true lover of sport in that.

I found my stream dull as a ditch, the mill was silent and no water flowing through. At the tail where it met the main stream I made a try. Using a single horsehair cast with small red palmer and black silver-ribbed ditto, at my first cast I hooked a fair-sized roach, then a dace—immediately thereafter, to my disgust, there was a general "skedaddle" of roach, dace and minnows from my chosen spot, a jack had arrived and hunted all the fish away. It was no use to fish on then, so I took to the angler's consolation, filled my pipe, lit it and quietly smoked till such time as I thought the fish would work back to their former quarters. By the time my pipe was done, I saw a rise; then I went at them again, caught a few—then all was dead—I could not tempt more. Leaving this place I went down stream and tried the quick gravelly shallow part of the river from which I have taken many a score. Not a fin was rising, although now little black gnats were out in fair quantity. At a quarter past four, I returned to my former place, and by a quarter to five I had taken 17 dace and a brace of roach—good fair-sized fish. The roach were in fine condition, but the majority of the dace were as rough as a file. Some of these had at this early date, already spawned, and others were full of roe. I observed also, during the day, that some dace were scouring themselves on a shallow. If my observations are correct, the condition of the dace is far advanced for the season. This view, if in accordance with modern anglers, is correct, but in turning over my library of angling books, I find that all the writers of this century put the spawning time of dace from April to May, or "early summer." On going back, however, to works within the last century, I find a unanimous opinion that this fish spawns in February and March. So say Taylor, Williamson, Best, Brookes, 1774; the *Gentleman Angler*, Bowker, 1792; Saunders, 1724. Have the seasons and the condition of fish changed, or are our modern authors not sufficiently observant; or, do the spawning times vary in different rivers? The authorities I quote, were all conversant with the rivers in the London district. Turning from the river to its surroundings—these are nearly bleak as winter. Not

a new blade of grass or spring flower is visible; tree-buds are just beginning to show that life does exist; but aloft the lark tunes its mid-air notes, while the thrush, blackbird, and cock-robin vie with one another in their evensong, each of them perched on extreme tree-tops, and as they pour forth their joyous melody one hears the old Horatian line—

“Solvitur acris Hyems gratâ vice Veris et Favoni.”

JOHN BRUNTON, M.D.

AMATEUR SEA-FISHING.

(Continued from page 101.)

FRESH-WATER eels, provided they be small enough, are capital baits for whiting-pollack, bass, and mackerel. We used to get a few hundreds for our purpose from the fishermen at Strand-on-the-Green, near Kew, who caught them by sinking bundles of osier rods in the ditches running in or out of the Thames, into which they got and were shaken out in quantities. They are likewise to be found under flat stones when the tide recedes, and in brooks, where they may be speared with a common steel dinner fork, with stone-loach and millers' thumbs.

The lampern and the lamprey are a favourite bait for whiting-pollack; turbot are very fond of them; but they are not so long-lived as the common eel. The limpet is an irresistible bait with sea-bream, and for whiting-pout it is a tolerable substitute in the absence of anything better. If the soft part is severed from the rest and exposed in the sun, it will acquire a toughness which it did not possess when quite fresh.

Mussels are a very general bait. They may be obtained at most sea stations for a trifle, and kept alive by hanging them overboard in a basket or in a net. Dabs, a delicious fish, may be caught with them, as well as whiting or haddock, &c. To open them without mutilation, take the mussel in your left hand with the byssus, or weed, towards you; cut this off and introduce the knife, not too pointed, as a lever to force the shells apart; detach the flesh that adheres to the upper shell, which remove, and then cut well under the body and the whole will be cleanly freed from the lower shell. It is a good bait for all ground fish, and other kinds occasionally take it. To bait with a mussel, spread it open in your hand, when the tongue will be observed, through which pass the hook, then closing it double, turn it over and pass the hook through the round grisly part by which it attaches itself to the shell. The whelk is well known. It is used in cod-fishing. There exists but little difficulty in procuring them, either from the fishermen, or by collecting them in pools left by the tide amongst the rocks. They may be used either boiled or raw. The periwinkle may be mentioned here as a bait for many fish; but as the tail is the tit-bit of attraction, this gone, the likelihood of success is greatly diminished. The cuttle-fish, or sepia, is a bait for bass, cod, conger, &c. Its flesh partakes of a consistence between jelly and leather, very tough, and of a beautiful pearly whiteness, which Wilcocks considers its chief commendation as a lure for bass-fishing off the beach, when the lead must be cast with all one's strength to get it as far out to sea beyond the breakers as is possible. To clean these fish, pull off the head, split the body sideways, remove the skin, back bone and sepia bag, and wash them in water. Do this as soon as they are dead, and if they are kept in a cool place they will last a day or two. We are told by several writers that a description of sausage was made from them by the Greeks and Romans; they are eaten at the present day in some parts of the kingdom, and on the Continent.

The squid is much more plentiful than the cuttle-fish. It is in some localities called the pen-and-ink fish, the ink being contained in a bag in its inside, and the bone being somewhat like a

quill pen. It is preferred to cuttle-fish for conger, cod, bass, &c., as it is not so hard but quite as tough. They are easily taken by lowering a line, within a short distance of the bottom, to which is attached any description of fish; if there they will at once seize upon it, then they can be drawn steadily to the surface. But upon this subject we are cautioned not to be too precipitate in securing it, but to be provided with a stick about six feet in length with four hooks lashed back to back on the end; hook the fish near the tail if possible, and with the same stroke drag it under the water, by which means you will escape the shower of ink which they almost always vomit forth at such times. The barbs of the four hooks should be filed off, or there will otherwise be a difficulty in withdrawing them from the squid. Such hooks are made expressly for catching squid for the Newfoundland cod fishery. There are two other sorts of squid; the sepiola, or little squid, and the flying squid, which often in its leaps from the water falls on the deck of the vessel. The sucker or poulpe—this is the *octopus vulgaris*, and it is a redeeming feature in the history of this hideous monster, that it, when dead, serves the useful purpose of bait. Indeed in British Columbia and Jersey, they are roasted and eaten by the inhabitants. They prey upon crabs and lobsters, and those who are curious as to this part of their animal economy may at feeding time at the Brighton Aquarium see how they contrive to embrace a huge crab with their demon arms lined with suckers, and make but short work with it. In Guernsey the fishermen have no mercy on it, and to disable it turn its cap inside out and carry it on a stick after capture.

The common green crab (*carcinus marnus*) is an excellent bait for flounders, fresh-water eels, bass, sea-bream, &c. They are best when about to cast their shell, in which state they are met with almost the whole of the year. They are caught in any quantity in hoop nets baited with a piece of meat, or any garbage.

Whatever doubt there may be of the possibility of meeting with a conger of one hundred pounds' weight while deep line fishing, there exists little that although halibut are not very abundant in the Channel, an occasional monster of from 100 lb. to 300 lb. is occasionally met with, while deep line fishing. We may be, therefore, excused if we say a few words of this flat alderman of the seas. Wilcocks calls this *pleuronectes hippoglossus*, a “gigantic flounder,” and tells us that, on the banks of Newfoundland it is considered a very unwelcome visitor, being often cut adrift by the fishermen when it does not escape by its own strength. Other writers inform us it is common on the N.-W. American coast, and is there taken with squid, or sunken bait, on a strong line floated with inflated bladders, after which it is speared. In the London market it often fetches 10d. to 1s. per pound. The largest halibut on record, as taken on our own coast, mentioned by Pennant, weighed three hundred pounds; and the heaviest seen by Couch was more than one hundred and twenty four pounds; but he mentions one as caught near the Isle of Man in April, 1828, measuring seven feet and six inches, and in weight three hundred and twenty pounds. Olsson refers to an example of little less than twenty feet in length. According to Bloch, these fishes may be said to associate together; and we learn from other sources that this assembling of holibuts (by the by, Couch spells it thus), is on a bank of sand in shallow water, where they lie basking in the sun; and, when discovered, they are assailed with the spear with which the fishermen endeavour to pierce and fix them to the ground; but in doing this much skill, strength and patience are necessary to prevent the boat from being swamped or capsized by the powerful struggles of the fish, which are known to be very violent, and as such are recognised by British fishermen when the halibut has chanced to swallow their hook. By them this fish is represented as being very wild, and its powerful efforts

to break loose are characterised by violent and sudden jerks in various directions. When, therefore, it is transfixed with the spear, the fishermen of the North proceed to raise it very slowly; and, when brought within their reach, a club is called into requisition, by which, as soon as possible, it is deprived of life. It may be observed that the farther north we go the larger and more abundant are the halibut; whilst the turbot, which is rare in Orkney, increases in number towards the south.

As food, the halibut is much inferior in goodness to the turbot and brill (by the bye, we ought in its place to have mentioned that the brill is preferred by many connoisseurs in fish to the turbot, particularly the large ones, which are usually very coarse, with but little flavour. The best esteemed are between ten and forty pounds weight. On account of their great size they are usually sold in slices by the pound weight. The head and fins are considered the best parts.

Halibut are caught either with the hand-line, or spiller, in the same manner as the turbot; and, being an extremely voracious fish, afford good diversion from its strength and power in the water, and will take almost any description of bait. As a proof of this, Pennant mentions two instances that occurred in one year of their swallowing the lead at the end of the line with which the seamen were sounding the bottom from on board ship: one off Flamborough Head, and the other going into Tynemouth Harbour. The latter was taken: the first disengaged itself. Couch terms the halibut the "Ladyfluke."

The whiffe (*Rhombus magastoma* of Yarrell, and the Carter of Crouch), who likewise farther names it Mary Sole, or Queen's Sole (?), bears some resemblance to the halibut, and may be termed a common fish along the south coast of Britain. In Cornwall it is not unfrequently taken with a line, as well as in the trawl. It is little valued, on account of its meagre appearance; the quantity of flesh which clothes its skeleton being in less abundance than is common with any other of the British flat-fishes. The body is, indeed, so thin as to authorise the name of lanthorn fish, by which it is sometimes called. They are likewise met with on the Welsh coast, and are occasionally caught off Weymouth. Its usual length is from about eighteen to twenty-one inches. They take the same baits as the plaice, and are rapacious feeders.

(To be continued.)

THE RIVER YORE.

A SHORT time ago I gave you an account of the Swale, with the description of a most enjoyable holiday thereby. I now send you a corresponding article on the larger and more important twin-sister, the Yore. Like the Swale, this splendid stream has its source in the Pennines. It rises on the south side of Shunnerfell, and flows mainly in an easterly and parallel direction to the Swale, with which it ultimately unites below Ripon. Here both streams, contrary to the usual geographical rule, lose their names, and henceforward form the Yorkshire Ouse. I venture to think that herein is involved a measure of injustice to one of the finest piscatorial streams in the land. Practically the Yore extends from the Pennines to the sea, and most of the other Yorkshire streams with the Trent, Ancholme, &c., are its tributaries. Viewed in this light, its river basin carries more water to the sea than any other in England. The Yore flows through ground rendered historically memorable by the families of Neville and Scrope. On its banks the great King-maker wandered, and the beautiful Mary Queen of Scots was imprisoned. Bolton Castle is the venerable pile that claims the honour, or rather dishonour, of this confinement. Mary had escaped for a few hours from her enemies, to be recaptured at a place called from this circumstance the Queen's Gap. In the time of the Plantagenets a great

portion of the dale was covered with wood, and tradition says it was one of the favourite hunting-grounds of King John. A few relics of feudal times yet remain. At Bainbridge, one of its most ancient villages, a curious custom of blowing the forest horn in the winter evenings still exists. The installation of horn-blower forms a red-letter day in the history of the place, and he who is favoured with its possession is regarded for the time being as a sort of village mayor. Doubtless, when the surrounding moors are covered with snow, and the weary wayfarer is benighted and lost, when the frozen grains driven by the cold east wind strike the exposed face of the drooping traveller, the peal of the distant horn comes winding up from the valley sweeter to him than a thousand concerts, for its echoes lead him to the cheerful firesides of a warm-hearted people. This river is sometimes called the Ure, or Yure, but Yore is the local and favourite, and, as I think, the most poetical name. It runs through the beautiful and verdant vale of Wensley, world-renowned for its excellent bacon, cheese and butter. With the exception of a few fields in the lower parts of the valley, all is rich pasturage, and the Wensleydale farmers can hold their own in this department of agriculture against any in this land. They are a fine, stalwart, hospitable race of men, and are justly proud of their charming and secluded valley. I shall never forget the impression made upon my mind when first its glories burst upon my view. I was journeying over from Swaledale on an angling excursion, and having reached the summit of the heather-clad hills, its spreading fields and meandering stream were glittering in the ruddy light of the rising sun. Every dew-drop on the purple heather, every hum of the flitting insects, every breath of the passing breeze, seemed to speak of life, and involuntarily my lips uttered:—

Wensleydale! I dearly love thee!
All things in thee seem to smile,
Semblance of the land above thee,
Fairest vale of Britain's isle!

Near to Aysgarth are the prettiest of the Yorkshire waterfalls, called respectively the High, Middle and Low Force. The meed of superiority is generally given to the Low Force; but in my judgment the picturesque beauties of the High Force should carry away the palm. We have here a union of nature and art which is lacking in the Low Force. An elegant bridge of one arch spans the river, and the lofty Yore Mills add to the beauty of the scene.

Such a place as this sends a thrill through the frame of the poet, and causes the artist to fondly treasure the remembrance of its beauties for his easel; for whether we behold the sparkling of the limpid waters, leaping over the terrace of water-worn rocks and broken into a hundred rills by fantastic ledges and abutments, or gaze upon the glassy pool below, with the mantling foliage of the precipitous left and the smooth emerald slope of the right, spangled with wild flowers, we dream not of Elysian sweets, for we are among them. Many and interesting are the pic-nics which take place from time to time amid these delightful scenes, and I might revel in the glories which past reminiscences suggest, and forget the object for which I took the pen in hand. During my excursion of last summer, I had the pleasure of inspecting some large and excellent photographs of these localities by Mr. Raine, of Richmond. They not merely do justice to the beautiful surroundings, but reflect the highest credit upon the artist's skill.

The Yore flows through a wider valley than the Swale, and consequently has a larger basin and bed. Its course is marked by a succession of rapids and deeps, the latter of which are sometimes of considerable length, while the bottom consists of an alternation of rock and sand. The river contains grayling as well as trout, in about equal proportions. The fish are more numerous and larger than those of the Swale, but, owing to the abundance of substantial

food in the water, are somewhat cautious, in their acceptance of invitations. It may be that, like the natives, they are somewhat more refined and particular in their tastes and fashion than their cousins of the Swale. Fish of 2 lb. or 3 lb. are often caught, and some have weighed as much as 5 lb. or 6 lb. Mr. Skidmore, of Askrigg, had one last season of 3 lb. some odd ounces. There is a well-authenticated account of one being caught near the site of the Yore Bridge Grammar School, which weighed about 14 lb.—alas! this monster was caught in a net—which the captors thought at first was an otter. The river in its upper course is clear and remarkably free from incumbrances. An angling association was established at Hawes in 1863, which, to its credit be it said, remains in operation up to the present time. The terms to residents are 5s. the season; to non-residents, 1s. per day, or 10s. the season. There was formerly a similar association at Askrigg, but I am sorry to say the public spirit of this town, so far as fishing is concerned, is at a discount, and netting is not uncommon. A ticket at Hawes entitles the holder to fish for a course of about twelve miles, and in a locality, in my estimation, far superior to either the Dove or Derwent. Some of the happiest days of my life have been spent in this delightful vale, and though oftentimes fishing under adverse circumstances, I have never gone home empty-handed. An Askrigg veteran, who, though bearing the burthen of well-nigh fourscore years, was hale and vigorous, generally accompanied me. He was one of those so passionately fond of the gentle art, who would fish from early morn to evening shade without tasting food. He has thrown his last line; but the memory of his name is yet green in the dale. He well knew the habits of the fish, and could tell almost to a minute when they would begin to rise. Most anglers know that in some localities if the fish are not on the feed, it is lost labour to attempt their capture. This remark applies forcibly to the Yore. In the early part of the season they will not rise till mid-day, later on they rise at eleven o'clock, later still at ten, and so on until they only feed early and late. There are, however, a few exceptional days. Perhaps an account of one of them may not be uninteresting.

I had made inquiry of my friend, "What time will they rise?" "Not before ten o'clock," said he. But I could let him have no rest. To the water-side I would go soon after six o'clock, commencing in good earnest the business of the day. But though trying the best flies, and fishing with all the skill that I could command, it was evidently not yet breakfast time with the spotted beauties. We were fishing up the stream, my friend taking the right, I the left. How many times during that eventful morning would I have sacrificed a few hours of life to see the darlings rise. Slowly passed the creeping time. The distant church clock pealed seven—eight—nine, still no indication of life in the pools. So at last we sat down, he to his pipe, and I to my wallet, ever and anon casting our longing eyes up and down the stream for the first appearance of the fish. Presently, just before us, came a splash, and the arching eddies almost reached our feet. Pipe and provisions vanished as if by magic, and our rods were retaken with the greatest alacrity. We walked to the foot of the next rapids, which could not well be fished from the other side. My companion suggested that I should fish the same, and he would look on. My first throw secured a rise, and a beautiful trout of 1 lb. was soon turning somersaults on the greensward. I looked at my watch and found it three minutes past ten. The next few minutes were eminently golden, for I hooked and landed, without moving from the place, seven fine fish. Presently there came a stronger run, and a sort of pull and counter-pull, which at first I could not well understand, but which ultimately explained itself when I landed two trout at once, weighing respectively $\frac{3}{4}$ and $\frac{1}{4}$ lb. I was fishing with single hair. My companion, seeing this, could stay no longer, but

moved on in the hope of doing likewise; but the event of the morning had yet to come. He could not have gone more than 200 yards before I hooked one of the finest fish the Yore contained. He showed the noblest play, but, try as I would, I could not get a sight of my game; he resolutely stuck to the opposite side of the river. By his predilection for the ground, and the manner in which he conducted himself, I judged at once that it was a large grayling. After playing him for ten minutes, my friend, who had come back to see the fun, observed that it must weigh at least 1 lb.; but, as he noticed the way in which the battle proceeded, the size rose rapidly to 2 lb., 3 lb., 4 lb., &c. Presently, the fish managed to get beneath some willows, which not merely fringed the edge of the water on the other side, but dipped beneath the surface. Of course, I wrote it down for lost; but no—by patience and care I managed to get him once more into the open stream, where he became sulky, choosing a place and sticking to it until it pleased his highness to move on—to re-enact the dodge elsewhere. Had there been any salmon so far up the stream, I should by this time have thought that I had hooked one. At last I grew quite tired of the fight, and thought I would put on a tighter strain; but it was useless, he would only move when and where he liked. Then a lazy demon whispered in my ear, "Make him come." Fool that I was, I listened to the tempter, and put on a strain that would have broken almost any fly-gut; yet my well-trying hair nobly stood the test. I never saw such a piece before, and never shall, I fear, again. Only a few days before this occurrence, it had lifted a flat-iron 5 lb. in weight, by putting it underneath the handle; and I verily believe it would have lifted more, but I feared breaking it. "Pull harder," suggested the demon. Despite the offer of my friend to wade and land it for me, despite my knowledge that the hook will often tear away from the mouth of the grayling, I still tugged on, the fish fixing himself resolutely at the bottom. Common sense—for the time, I had lost it—might have told me that something must give way, and it did; after a battle of half-an-hour the hook left the mouth of the fish—I say mouth, for I cannot think it was foully hooked, or something else would have yielded. My cast of flies was uninjured. Oh! what would I have done to have had him once more at the end of my line! If any fellow ever deserved the cat-o'-nine-tails, it was myself; and, you may depend upon it, Tom always gets a blowing-up from himself when he thinks of it. The old saw, "There's many a —," &c., is no consolation under such circumstances. When the prize was gone I would have walked in the water up to my chin to have secured it, or almost have parted with a finger to see it jumping on the greensward. What this fish weighed, I cannot say, as I never saw my master throughout the whole contest, neither could I get within four yards of him. But a fish was caught—and, with shame be it said, in a net—a few days after, not far from the place, which weighed $6\frac{1}{2}$ lb., which I shall always think was my old acquaintance. Notwithstanding the gloom caused by the above adventure, the day was marked in red ink in my fishing diary; for on winding up I found that I had thirteen grayling, nearly uniform in size, and weighing 7 lb., and about the same number of fine trout, one of the latter weighing 17 oz., and two of $\frac{3}{4}$ lb. each. Of course, my friends will judge that the circumstance detailed above occurred before my noviciate as a trout-fisher was fairly finished, but the lesson conveyed has not been lost. I have from that day to this been remarkably fortunate in landing large fish. Many a fine salmon has since then fallen to the same rod, while out of the whole batch I have lost but one solitary fish, and that my first, hooked on ordinary trout tackle. I promise my readers a yarn anent the same ere long.

Below Aysgarth Force a few salmon are found, though late in the season. A good length of the fishing hereabouts belongs to

Lord Bolton, whose agents seldom refuse a day or two to respectable applicants. Still I prefer the upper reaches of the river, and these remarks must be looked upon as relating to them. The propriety of erecting salmon-ladders to allow this fish to pass the Aysgarth Falls has from time to time been discussed. It would, however, be a most costly enterprise, and in my judgment a questionable advantage. So far as my experience goes, I have always found that the presence of salmon deteriorates the trout-fishing; and to ruin the fishing of the whole season for the benefit of a month or two, can hardly commend itself to the reflective portion of the fishing fraternity. A much better course would be to introduce some other varieties of *Salmonidae*, the *Fontinalis* (American brook-trout), for instance. This lively and beautiful fish is now reared in large numbers by Mr. Capel, of Foot's Cray, in Kent, and I am sure, from what I know of him, that he would treat local associations in a liberal spirit.

The flies to be used on this stream are similar to those for the Swale. I have just published a book on trout-fishing, which contains, amongst other interesting matters, a list of 130 different flies, with way of manufacture and seasons for use. It is just the thing for this locality, and, in fact, for all the Yorkshire, Scotch, and West of England rivers. I shall be happy to send copies direct and post-free to any old friends at the published price of one shilling. About three miles from Askrigg is a small lake of nearly a mile in length, called Summerwater, in which is a good store of trout, though they are far inferior to the Yore fish, and at the same more difficult to catch. Perhaps the Gillaroo trout, of which Mr. Capel also makes a specialty, would thrive here. This is well worth a visit from tourists. There is very fair accommodation for visitors to Wensleydale, and I can assure all who may make the run of the valley that they will go away with pleasant memories, which will remain with them to their latest day. The Midland and North-Eastern Railways are connected by a branch, which compasses the whole of the dale.

In conclusion, I desire to thank the kind friends of Wensleydale for their considerate conduct to me during my last summer excursion; and even now, when the snow is scarcely melted on the tops of the everlasting hills, I am anxiously looking forward to a future and an early renewed visit to this English Paradise.

THOMAS FORD.

THE NATURAL HISTORY OF THE EEL.

WE have to thank you heartily, Mr. Editor, for the excerpt from Dr. Quistorp's paper, concerning the generation of eels, published in your last issue. It threw considerable light on the interesting question, but exception must be taken to some of the statements made therein. I will proceed to refer to them seriatim, and then, with your permission, will add a few remarks concerning the general natural history of this most curious fish. First, half way down the first column of page 124, will be found this statement—"It is only in real salt water, and not, as hitherto supposed, in brackish water, that the full development of both male and female can take place." Now the author has placed on paper no qualification of this sweeping assertion, and a moment's reflection on the part of the ordinarily-experienced angler will reveal its inaccuracy. I assert that eels will breed, and breed largely, in land-locked fresh water—that is, ponds and lakes having positively no access to any water at all approaching brackishness. And, indeed, how often is this truth to be reiterated. During the past eight years I have seen similar statements to that which I have denied made in Continental and American natural history publications *ad nauseam*. I am not now asserting that eels do not prefer brackish water if by any possibility they can get to it, but my contention is they will spawn and milt in places where no sea has been since antediluvian times.

I laid emphasis on the word brackish just now, which sufficiently indicates my opposition in opinion to Dr. Quistorp's assertion about actual sea or salt water. My reasons are—first, Mr. Buckland, in his "Familiar History of British Fishes," asserts he saw some young eels actually hatching out at the entrance to the harbour at Galway; and, second, the unquestioned certainty that if a freshwater eel be suddenly placed in sea-water it dies. However, when eels manage to arrive at salt water it may be that our author is right—though probability is, in my mind, against him. Anyhow, the sentence immediately following the one I quoted does not at all strengthen his dictum, it being simply negative evidence. It runs "Only in one single instance has a gravid female with ripe ova been captured by Radke in brackish water." What Radke has not found, does not establish a position concerning what is to be found, I imagine.

Further on we are told, "eels eat no food whatever on their way down to the sea, and in this respect they take after other fishes." Now this is, again, unqualifiedly wrong, for on rainy nights when eels have been "running," as it is termed, I have repeatedly taken them with ordinary strong leger tackle; not frequently, I admit, as compared with the results of fishing earlier in the season when they have been ascending, but sufficiently to form a strong exception to the doctor's rule. And again, he reiterates the inaccuracy referred to in the first quotation above in the following words: "In addition to the spawning eels there are, however, others in whose intestines food may at all times be found [luckless admission, through a true one!] and these are always in condition and fat, though they never stir out of the fresh or brackish water. All these are barren females, whose ovaries, if examined, will be found in a degenerated condition with transparent, or almost entirely yolkless, ova."

In reference to this last astounding statement, I will let one or two quotations from more or less reliable writers stand as denials. Couch (R. G. in the "Zoologist," 1847, p. 1830), says: "Last summer I took a quantity of mud from a spot much frequented by eels, and carefully examined it to see if there were any ova in it; and after testing several specimens without success, I was at last gratified by observing the eels small and transparent lying on the surface almost motionless. They rapidly grew and in ten days acquired strength and size to swim about." The Rev. W. Houghton mentions that at a place on the river Stour he found it alive with young eels, "some of them scarcely hatched, at a depth of five to fifteen inches." In my "Practical Fisherman," also, these words appear—and after what I have before stated I need scarcely say I adhere at this moment unreservedly to them—"The magnificent opportunities which the lakes of Windsor Great Park afforded me during nearly two years for observation were sufficient to enable me to examine the milt and spawn of eels repeatedly, and to gather up hatched fry for microscopical examination from waters far above the level of the adjoining lands, where egress meant impossibility of return." I leave these passages without comment.

Next week I hope to resume the subject of the natural history of the eel.

J. HARRINGTON KEENE.

(To be continued.)

TO ANGLERS.—W. J. Cummins, Fishing Tackle Maker, Bishop Auckland, is now prepared to forward to anglers his Illustrated Catalogue, which is not only a Trade List but is interspersed with practical hints, useful directions, and valuable information gathered by the river-side from twenty years' experience. The stock consists of his unrivalled Salmon, Trout, Grayling, and Pike Rods, Lines, Reels, Baskets, Artificial Baits, Fly-books, Landing Nets, Gaffs, and last, but not least, his celebrated Trout Flies, which for killing powers stand unequalled. Every article kept in stock is of the very best description.—[ADVT.]

GEORGE JAMES EATON, of Starkholmes Matlock-Bath, Derbyshire, respectfully invites Noblemen and Gentlemen to try his standard FLIES for the present season. No flies sent or made up but what he himself has proved sure killers. A trial is all that is required from gentlemen who can fish to prove whether they may be genuine or not. Patronised by some of the best fishermen of the day. All flies dressed on the best Kendal hooks. Prices: Point Flies, 2s. 6d. per Dozen; Dropper Flies, 2s. per Dozen. Orders punctually attended to.—[ADVT.]

RIVER REPORTS

MID-THAMES.

"He is well paid that is well satisfied."—

SHAKESPEARE.

The season of 1880-81 is over, but I fear few frequenters of Father Thames will be well satisfied, or think themselves well paid by the result of their doings. On another occasion I shall have a bit to say with regard to the past season, but in my present note must confine myself to the last week's doings, and never mind the rest for a while. At Maple Durham some excellent perch and chub have lately been had, and at Caversham one trout of 8 lb. returned; three dozen roach and two dozen chub by one puntsman on one occasion, and by a bank angler one dozen perch and some nice chub, best going 4 lb., taken with tail of lob worm. At Shiplake and Sonning excellent baskets of roach and chub have been had since the water has been dropping—one artful banker on one occasion getting 19 lb. to his own hook. From Henley I glean that the last days of the season turned out better than was expected by the local talent—Mr. J. Stead (the Cure), amid some decent coarse fish, getting, whilst legering a 4 lb. trout, which was curiously danced into the river again by this good angler; Mr. Witham, with E. Vaughan, three jack, best 7 lb.; Mr. Pugh, with Tom Neal, four jack, largest 12 lb.; Mr. Petchey, with Parrott, two good jack and four dozen of roach had near Regatta Island. At Medmenham and Hurley Messrs. Sykes, Irwin, and Davies have been doing fair work considering the bad weather—best perch 1½ lb., and largest chub 3 lb. A Mr. Thomas, whilst fishing from the bank near Hurley Lock, on Sunday, landed a pretty jack of 8 lb.; and Castor, the fisherman from Temple, got hold of a nice basket of roach and perch. At Marlow, Saturday, Sunday, and Monday last great execution was done amid the finny one, 11 lb. of roach and one jack of 2½ lb. being had by Mr. Brooksbank, with his usual lobby bait; one jack of 19 lb. by a Conservancy man, who evidently was not a good Conservative, for he sold his fish-right for 6s. to a wandering Jew banker, who, under the circumstances, decidedly should eventually become a Rothschild. Between Cookham and Marlow on Monday the Wycombe Angling Association held an angling competition on the Thames, the chief prizes being obtained by Mr. Maskell (of the George and Dragon, Great Marlow), Mr. Stratford and Mr. Lovell, of Wycombe—three prizes being withheld for want of the necessary fishes.

Thursday evening.—The weather has taken a delightful turn for the better, and trout prospects consequently hourly improve. It is my impression that good sport will be obtained early in the season on the Thames with the spotted fresh-water beauties.—MARLOW BUZZ.

Thames (Goring).

Water in good order. Monday, the last day, some good takes of perch were had here. Sunday and Monday, two perch, going 4 lb. I was out on Monday for half a day; took 14 lb. of perch and one jack.—JOHN RUSH.

Thames (Richmond).

The river was in very fair order for fishing the last four days, but sport was very slow indeed; I don't think there was one punt that got 10 lb. of fish in one day out of all the punts that were out here. It will be a good opportunity now for the members of angling clubs to visit Richmond, to try and get the netting stopped as far down as Kew Bridge, during the fence months. The weight of the clubs and the Thames Angling Preservation Society will go a long way towards stopping it. If we get a hot summer the fish are sure to get down for the stream, as they won't stop in deep water in hot weather, and they will be swept out with the net besides; there are some of the best streams about Isleworth you could find in England, where, to my belief, there is often a trout or two, and if by chance there is to be got by the netmen. This is the eleventh season I have had as a professional fisherman, and it is the best season I ever had.—JOHN BUSHNELL.

Thames (Windsor).

Immediately after the season is over we get a state of things which would gladden the heart of any angler. Here it is looking as fishy as possible, yet but a few days back anglers were floundering about on greasy banks, and hopelessly fishing in a sea of soup. Some were rewarded with a few roach and perch; others with a sight of them, and still more without seeing a fin. Some nice roach were had, but the perch ran very small. Mr. Parsons, of Windsor, had seventeen, Monday last, fishing with James Gray (fisherman), out of which he had to return nine. Taking the season, 1880-1881, it has been very poor as regards sport, though few anglers were out during the summer floods of 1879. Those who were will remember it as about the best season for sport they ever had on the Thames. It was all worm fishing, and very large bags of barbel, roach, and chub were had. Pike have had a long rest, and there must be a great quantity now in the Thames; and if a dry autumn, 1881 ought to see capital sport with them. As regards trout the warm suns of the last few days have brought them to pursue their old sport of chasing the bleak on the surface, and already I hear of some nice ones in the neighbourhood; but as seeing is believing, shall get on the "qui vive," and report to your readers their exact whereabouts. Bleak are coming to the surface, and may be seen in quantity all up the river.—B. R. BAMBRIDGE.

Bure (Acle).

I wish to inform our angling friends that Mr. Rose, of the Bridge Inn, Acle, has every accommodation for fishermen during the coming season. Several

commodious boats are added to his "fleet," and as it is within easy reach either of Yarmouth or Norwich, lovers of the rod will do well to pay him a visit. Several London gentlemen stayed with him last summer, and expressed themselves as satisfied, both with the sport they obtained, and also with his catering. I saw some very nice perch that were taken close to the house on Sunday last.—ANGLER.

Carlisle-on-Eden.

We have had a first instalment of spring weather since Saturday. The rivers have been in good condition for bait-fishing the last three or four days. On the 11th inst. J. B. Slater, Esq., killed twenty trout; on the 12th inst. Mr. Samuel Wright killed twelve trout; and on the 14th inst. Mr. Robinson Bone and Mr. James Bone, of Cargo, killed about 10 lb. each of trout and sea-trout.—THOMAS PARKINS.

Dove (Derbyshire).

The trout are now in prime condition, and are beginning to rise at the fly eagerly. The April duns are now on the water, and if the present mild March weather continues we shall shortly have good slaughter to report. The best dish got this week was one of five brace near Clonholme. Several grayling have been caught while trout fishing; but, owing to the close season, they have had to be returned to the water. A trout of over two pounds weight was killed in the Henmore with that excellent spinning bait, the Derby killer. The coarse anglers were very busy on Saturday and Monday, the weather, fortunately for the close of the season, being all that could be desired. The worm was the bait chiefly in vogue, and some good baskets of fish were killed, chiefly roach, chub and perch.—THE SPLODGER.

Exe (Exeter).

Another week of difficulties. To what disappointments we are doomed; the 14th is here, and although many attempts have been made, nothing done. This was to have been the first and last trial since the breaking up of the inclement weather. The river was getting into fine order on Saturday, and as it lowers very quickly, and Sunday intervening, we were all agog for the Monday, with rods and lines and bait in store, &c., but alas here we are smiling at our grief. Not that we mind the soft weather, but when we have such a downpour as we had on Sunday, say eighteen hours, it is impossible to get near the river banks, by numbers of yards, yes, hundreds of yards; consequently it is as well to talk over old times, and attempt something for the new, and we sincerely hope, ere the 15th of June, our position will be recorded as not being quite defunct, but that a new club will be added to your already long lists, and that their doings will be better worth reporting than what it has been of late. Trout-fishing is really not nil, for one of 1½ lb. weight came to scale during the week. Salmon, no report either by rod or net. Speaking of trout, have you seen that excellent little work on trout-fishing, by Thomas Ford, of Caistor? It really is the "vade mecum" of anglers, and should be in the hands of all. I hardly know which portion to comment upon, whether the introduction, the miscellaneous portion, the fly making, or the list of artificial flies; suffice to say the whole of the work is well worth the addition to the anglers' library, and the price, one shilling.—FRANK GOSDEN.

Exe (Tiverton).

The river is very clear and bright, and in fair order for fly-fishing. The weather at present is very bright, wind N.W., barometer rising, and fish sport only moderately well. Dull, cloudy weather, with a S.W. wind would improve matters; but, nevertheless, if anglers persevere they will be rewarded. One gentleman yesterday killed 41, which is the best basket I have heard of for the season, nearly the whole of them with the blue upright—the halfstone is also killing well. A few casual March browns have been seen within the last few days.—WILLIAM MUDFORD.

Lee (Co. Cork).

While the Blackwater has been up to the present quite unproductive of sport, the accounts of the Lee are of the most satisfactory character. The river, after the recent floods, appears to be well supplied with fresh fish, the increased preservation having contributed to that result. The weather has been delightful during the week, and the river has been in magnificent order. On Friday Mr. Persse, of Macroom, landed six springers in the upper Lee, or that portion extending above Macroom, where there was excellent trout and salmon fishing, and good hotel accommodation. Daniel Killehen, fisherman, Macroom, killed five on Monday, as a freshet caused by some rain on the previous day was clearing off. Mr. George Haynes landed five on Sunday, all varying from 10 lb. to 9 lb. Two were taken on the worm, and in the evening, while the water was rising, he took three on the "colley" in half an hour. I explained to you on a previous occasion that what we call the colley is what is known in England as the stone loach, which, in certain stages of the weather and water, becomes a very good bait. The other successful anglers during the week, whose name is legion, included Mr. R. Dunscombe, 4; Mr. Pratt, 3; Mr. Bass, 4; Mr. Dale, 3; Mr. Lambkin, 2; Mr. Angler, 7, in three days; Lord Bandon, 1; Mr. J. Bailes, 3; J. J. Fitzgerald and E. Fitzgerald, his brother, who carry on the fishing-tackle business in Tuckey-street, Cork, 1 each. Mr. Augustus Warren, Mr. George Colthurst, Major Nettles, Mr. R. Bailes, Mr. Bowen, and Sir Oriel Forster have been successful on their respective fisheries, and altogether we have had a remarkable week in the annals of rod-fishing on the Lee.

Severn and Teme (Worcestershire).

The above-named rivers are fining down and the anglers are looking forward to the coming season with great expectations, and I am also of the opinion that we shall get good sport amongst the trout. Two members of the Broughton Angling Club caught five and a half brace of small trout and a few roach, on the 13th inst.; they were plump fish. The above-named club have decided to have their annual dinner on the 4th of April, when they will elect the officers for the next twelve months. They have several stretches of water in the county, and are going on well.—E. TURLEY, hon. sec.

Suir and its Tributaries (Clonmel, Ireland).

The river is now in splendid order for rod-fishing in almost every place. It was slightly flooded during the past week, and the salmon only took the fly on the streams. Dr. Cook got two on Saturday, 10 lb. and 11 lb., on the Newcastle Bridge stream. John Hogan got another on Sunday at Newcastle. John Beston got, near the same place, 12 lb.; Mr. Bagwell got one of 15 lb. on Tuesday at Marlfield; and Dr. Cook was again successful on Wednesday, killing one at Newcastle weighing 8 lb. The cotmen have had good fishing at Clonmel, killing 34; and the cotmen at Derrinlaur got 25 for two days this week. The water being rather low for Clonmel, they only got three or four each day. The trout-fishing is very good everywhere at present and the fish is in better condition. The gold wren, orange grouse, and March brown are the best flies just now.—DORA.

Trent (Alrewas).

In concluding my last week's report I remarked that the rivers were rapidly falling, and would be in condition by the end of the week for re-commencement of angling. On Friday the water was sufficiently clear for the fish to see a bait in the slow swims and eddies. The result was the capture of some fine roach and chub by Messrs. Bullock and Chapman. Many of the roach were over 1 lb., and the largest chub $4\frac{1}{2}$ lb. Although the weather has been remarkably fine, very little else has been done in the Trent. One of our best anglers gave the roach a good trial yesterday without getting a bite in the Trent. He remarks, "It will really not be in good order for a week, as the water is still muddy from the melted snow. Not being able to do anything in the Trent, I went to the Tame, which was in much better trim. Commencing below Salter's Bridge, I caught a samlet, which I returned, a bream, six nice perch, and a lot of roach. All the fish were in first-class condition." Everything has the appearance of being favourable for the next week, and I anticipate some good sport for our members.—JAMES GREGORY.

Waveney (Beccles).

This river, although rather high, owing to the immense quantity of rain we have had, is now in capital condition for angling, and some splendid baskets of roach and perch have been shown. A great number of very nice jack have been taken lately. On Saturday last Mr. C. Bumstead succeeded in landing a splendid roach, scaling 1 lb. $6\frac{1}{2}$ oz., and measuring from eye to tail $12\frac{3}{4}$ inches. It was in splendid condition, and made a gallant struggle for liberty, but to no purpose. The general prospects for the season seem to be very promising.—C. B.

Wye (Ross).

The water is now getting in excellent order for the fly. It will be in first-rate condition by Monday, and no doubt some good trout may be taken next week. The topic of the day amongst anglers is the action of the Wye Conservators in resolving to abolish night netting, allow spearing in the upper waters, and to permit the taking of castspring during certain months. The night netting is the curse of the river, for if a strict watch were kept on all poaching, the Wye would be one of the best angling streams in the kingdom. It is not polluted to any great extent, and the Hereford sewage is about to be utilised, while before long action will be taken to compel the Ross authorities to stop their pollution of the stream. The fact is, the middle people do not take much interest in the river; the production of salmon in greater numbers does not affect them, nearly the whole of the fish being sent to other markets for disposal. It is well known that the lessees of the lower water, the millers, let very few fish escape them, except during the weekly close time, and the great injury to the river is done at Chepstow and the upper waters, where large numbers of fish are taken during spawning time. What is wanted here is a good angling association, to rent the water, preserve the fish, net the salmon draught only, and retail the fish, at a fair price, in the town.

Wye and Derwent (Derbyshire).

The glorious fine weather we have had during the past week has caused a good many anglers to turn out on both the above rivers, and I am pleased to say that sport, as a rule, has been very fair, considering the rivers being so very full and high. The worm-fishers have fared the best, taking both trout, grayling, and a number of coarse fish. On various parts of the Derwent trolling with the well-known Derby trout killer, has been followed with fair success, two and a half brace of fine trout being killed with it yesterday on the lower length of the Derwent, besides several other persons taking a few fish during the week. The fly-fishers have also killed some fine fish, chiefly grayling, off of both rivers. The killing flies have been the claret body bumble, furnace and spider flies. The natural flies have been out very strong on both rivers during the week, especially while the sun has been out in the middle of the day, viz., the long flat-winged browns, cow lady, house fly, and duns. Every fine day now fishing keeps improving. Trout have been rising very freely on the ponds, and in the brooks during the week, taking the small March brown very freely. The fish seemed to be from six ounces to about three-quarters of a pound each. Trout are in good condition considering the early season for them. I recommend gentlemen to lose no time in trying their skill with the fly, for our rivers are early spring and late autumn rivers. I recommend the following casts:—For the Wye: two casts, one made up with the small March brown, bumble point furnace, 1st drop, and hare's east dun 2nd drop; also for second cast, claret body bumble, point furnace 1st drop, and spider fly 2nd drop. I recommend the latter cast for the Derwent.—GEORGE JAMES EATON.

Yore (Yorkshire).

At length the welcome change has come in the weather, which has been simply glorious so far this week, and there seems every prospect of its continuing so. It will take another day or so to reduce the rivers sufficiently to ensure success with the artificial fly; but I should say by the time this is in print the water will be just right. According to promise, I will now give the dressing of one or two flies which will kill on the Yore and Wharfe for the next fortnight or so—that is until the March brown and blue dun get well out into the streams. One of the earliest flies on these rivers is the little early brown, it is best dressed hacklewise with a feather from under a swift's wing; body, orange silk waxed with cobbler's wax, with a few fibres of red brown mohairs at the breast. The red brown is another good fly at the present time: wings from a feather taken from a light freckled brown hen or from a brown owl; body, orange silk with a scrap of squirrel's fur worked in the breast for legs. The early dun is winged with slips selected from a brown owl; body, copper-coloured silk, tinged with a little water rat's blue fur for dubbing. These are all good trout flies for this month, and I should recommend the angler to fish with them as drop flies, using a red hackle, water cricket, or orange bumble at the end of his cast. I hope to hear of some good dishes of trout being killed before I write my next week's report.—FRANCIS M. WALBRAN.

TIED HANDS AND ARMS.—Edson's Electric Armlets and Wrist Bands. Invaluable for anglers and gun sportsmen and highly recommended for all persons having tiresome writing, sewing, or music practice. They give wonderful energy and strength, enabling the wearer to accomplish tedious work with steadiness and comfort. Price 2s. 6d. per pair, silk web and fine steel clasps. Sent to any address on receipt of P.O.O. payable to J. Edson, the Electric Fabric Co. Patentees, No. 1, Charlotte Street, Bedford Square, London W.C.—[ADVT.]

MRS. F. Y. BROCAS, Artificial Fly Dresser, 4, Mill-street, Conduit-street, Hanover-square, London, W. A stock of best flies always on hand. Flies made to pattern, LESSON in fly making given.—[ADVT.]

BERLIN FISHERY EXHIBITION AWARDS.

We are requested to state that British exhibitors to whom medals and diplomas have been awarded can now receive the same upon application to Mr. Edward Johnson, Commissaire Délégué, at the International Exhibition Offices, 1, Castle Street, Holborn.

We have received the Silver Medal awarded to the GAZETTE, and also a splendid "Diploma." The medal is a very fine piece of workmanship, and weighs about six ounces, and is nearly three inches in diameter. We here give an illustration.

THE FRIENDLY ANGLERS' FISH MUSEUM.

[N a previous number of the FISHING GAZETTE, I referred to a visit I intended to make to the club-room of the Friendly Anglers, at their comfortable quarters at the Albion Tavern, Albion Street, Hyde Park, in order to make a report of the Fish Museum; and, having carried out my intentions, it simply remains for me to detail as accurately as I can the different specimens and species of fish forming the very interesting collection I had to inspect. I must, first of all, acknowledge the great kindness and courtesy I received from Mr. King, the worthy host, on the occasion, in assisting me to note down the various descriptions of each, and in his desire to make my visit an agreeable one. I found the museum was particularly strong in the specimens of trout, perch, roach and dace; indeed, I should imagine few clubs possess a more formidable collection. It is, however, weak in its number of pike, although the four examples are not bad fish. It would appear the members feel this, and are anxious to strengthen the department by offering this year the valuable prize of ten guineas for a fish of 30 lb., which I hope they will get. At the Piscatorial Exhibition at the Royal Aquarium, Westminster, the Friendly Anglers were awarded a bronze medal for the general collection of stuffed specimens of fish, and for which I remember, as one of the jurors, they were regarded to be fully entitled. In the last presentation of prizes when the results of last year's competitions were made known, it would have been as well to have placed on record the doings of some of the members amongst the trout. The gross weight made by eleven of the members was 217 lb. 4 oz.—the large proportion, of 196 lb. having been caught with the fly by the four following members: Mr. Emanuel, 88 lb. 6 oz.; Mr. F. S. Hoblyn, 83 lb. 5 oz.; Mr. Craggs, 16 lb. 12 oz.; and Mr. Newson, 7 lb. 9 oz.; the smaller weights being made up by Messrs. Henderson, Hawkins, Hughes, Brown, Hunt, Mitchell and Garrett. Mr. Craggs, in addition to his 16 lb. 12 oz. of trout, weighed in 16 lb. 5 oz. of grayling. I may be right or wrong in stating that the Friendly Anglers, in reference to these two fish, trout especially, occupy one of the highest positions amongst the London angling clubs, as, on reference to some of the returns I have seen of other societies, the gross weight is largely in excess, and Mr. Emanuel and Mr. F. S. Hoblyn are practical champions. And now, as to the contents of the Fish Museum, commencing with the trout. There is a Thames trout of 10 lb. 13 oz. taken at Shiplake by Mr. T. Adlard, one of 6 lb. 5 oz. caught spinning by Mr. York, and one of 5 lb. 1 oz. taken on spinning tackle by Mr. W. B. Taylor, at Windsor. Of the Colne trout there is one of 7 lb. taken by Mr

G. Newson, another of 5 lb., and on one of 3 lb. 10 oz. caught by Mr. Henderson; and there is one from the Kennet of 4½ lb. taken by Mr. Emanuel. The four examples of pike are one of 19 lb. 2 oz. caught by Mr. Weiss, and one of 12 lb. 8 oz. taken by Mr. Pope, both from the Brent; one of 16 lb. 3 oz. caught by Mr. Powell, and one of 3 lb. by Mr. York. Of barbel there are four from the Thames, one of 7 lb. 10 oz. by Mr. F. Berry, one of 7 lb. 9 oz. by Mr. F. W. Howard, one of 6 lb. 14 oz. by Mr. Maure, and one of 6½ lb. by Mr. Beaumont. Of chub there are two from the Thames, one of 5 lb. 6 oz. by Mr. A. Ward, and one of 5 lb. by Mr. York. Two from the Colne, one of 5 lb. 8 oz. by Mr. Freeman, and one of 4 lb. 15 oz. There is also one of 5 lb. 10 oz. from the Kennet, by Mr. Garrett, and one from the Brent of 4 lb. 3 oz. by Mr. Bloxham. Of perch there is, first of all, a case of four magnificent fish weighing together 8 lb., being the portion of one day's fishing in the Kennet by Mr. F. Berry. Then there is a fine specimen fish of 3 lb. 12 oz. taken from one of the Norfolk broads by Mr. Garrett. In addition to these there is one of 2½ lb. from the Brent by Mr. Wallace, one of 2½ lb. from the Colne by Mr. Taylor, one of 2 lb. 6 oz. from the Cowley Canal by Mr. Yate, and one of 2 lb. from the Thames by Mr. Wells. Of carp there is a fine one, with no weight given, taken from private waters by Mr. Garrett, and another of 8 lb. 1 oz. from Regent's Park, by Mr. Cook. Of Crucian carp there is a single specimen of 1 lb. 5 oz. by Mr. Fordham. Of rudd, there are two in one case of about 2 lb. each, taken out of one of the Norfolk broads by Mr. Garrett, and a smaller one from the Colne caught on single hair by Mr. Wells. Of bream, there are four from the Colne, one of 4 lb. 10 oz. by Mr. Bloxham, one of 3 lb. 9 oz. by Mr. Grant, one of 4 lb. 12 oz. by Mr. Brown, and one of 3 lb. 8 oz. by Mr. Gayman. There is also one of 2 lb. 12 oz. from private waters by Mr. Fordham, and one of 3 lb. 14 oz. from the Serpentine in 1847 by Mr. Padley. Of tench there is one of 3 lb. 3 oz. from the Brent by Mr. Coke, and one of 2 lb. 8 oz. by Mr. West. Of roach there are seven specimens from the Colne, one of 2 lb. 5 oz. by Mr. Clare, one of 2½ lb. by Mr. Padley, one of 2½ lb. by Mr. Henderson, one of 2 lb. 1 oz. by Mr. Batson, one of 2 lb. 1 oz. by Mr. Padley, one of 1 lb. 14 oz. by Mr. Wells, and one of 1 lb. 9½ oz. by Mr. York. There is also one of 2½ lb. from the Thames at Hampton Deep by Mr. Ward, one of 2 lb. from the Lea by Mr. Watson—a splendid specimen of one of 2 lb. with no further particulars—one of 1 lb. 12 oz. caught on a tight line in the Uxbridge Canal by Mr. Fordham, and one of 1 lb. 2½ oz. by Mr. Brown. Of dace there are ten good specimens from the Colne, one of 14 oz. and one of 13¼ oz., without the names of the captors, one of 13¼ oz. by Mr. Hawkins, one of 12 oz. by Mr. York, one of 12 oz., with the fly, by Mr. Dyer, one of 12 oz. by Mr. Brown, one of 11½ oz. by Mr. Every, one of 11½ oz. by Mr. York, one of 10¾ oz. by Mr. Green, and one of 10 oz. by Mr. Padley. Of bleak there are three from the Colne, one of 2½ oz. by Mr. Gatesby, one of 2½ oz. by Mr. Strahan, and one of 2 oz. by Mr. Rice. Of Prussian carp there is one of 1 lb. 6 oz. taken out of private water by Mr. Verity. The grayling and gudgeon are represented by single specimens. There is a fine stuffed specimen of a very large sturgeon presented to the Friendly Anglers by Mr. Holdsworth. There are a number of framed engravings of piscatorial and sporting subjects, and a library containing a choice selection of angling works, which are kept in a mahogany case, presented to the club by Mr. Jennings, one of the members. The responsible post of librarian is filled by the excellent proprietor of the hostelry, Mr. King, who worthily discharges the duties of the office. On one of the mantelshelves in the club-room there is a glass case containing the model of an old gentleman laid up in his room with gout, fishing in a tub, with all the paraphernalia of angling materials about him, such as rods, landing-net, ground

bait, &c., &c., and the descriptive title on the case is "The Enthusiast." The Society of Friendly Anglers came into existence on the 23rd day of September, 1842, so that it is not of any recent origin. The number of members is limited to fifty. In addition to the annual dinner at headquarters in January, it has a summer dinner in the country, usually at Windsor. Long may the Friendly Anglers continue to flourish!

B.

WEIGHT, &c., OF FRESHWATER FISH.

THE season for the coarse fishing having closed, it might be interesting to those gentlemen who were chiefly instrumental in the House of Commons in getting the Freshwater Fisheries' Act passed, and especially so to Mr. Mundella, M.P., to know, as far as may be, what is the total tabulated weight of freshwater fishes actually caught during the season just closed, by the members of the various angling associations? It would, indeed, be also very interesting to those individual members who, by their prowess, had contributed to swell the grand total, and the public generally might also like to know how much, even in the present imperfect condition of our rivers, wholesome food in the form of freshwater fish had been fairly angled for and caught, and consumed by anglers or their immediate friends or relatives. The blood rose unbid to my face when I read about that fine lot (about three bushels!) of partly immature perch that were lately exposed for sale in one of the Jews' quarters in London. This has been admittedly one of the best seasons for herrings for many years. Cannot the poorer classes of Jews eat these fish on their "fast" days, and also the cheaper commoner sorts of unsalted sea-fish, instead of tacitly encouraging blackguard poachers and netters to go stripping at night time the upper ditches and water-courses, and even the tideway itself, of very many immature freshwater fish? If there was not a ready market among the Jews for these fish, the poachers would not risk the heavy fines and imprisonment and the loss of nets; besides, even the upper middle class Jews might possibly not be altogether blameless sometimes in the purchase of doubtfully gotten freshwater fish. These people, at least, can well afford to buy the very best of the sea-fish, and salmon, too. The Jews, one would think, of the better classes especially, would be so mindful and so grateful for the full enjoyment of civil and religious liberty in England, that they would be ever zealous not to raise dissatisfaction among any class of Her Majesty's subjects, least of all among the large and important and increasing body of Thames anglers, resident in London and other places, by buying fish *robbed* from their noble river. Let the upper class Jews, therefore, exercise their undoubted influence among their poor brethren in faith, to discourage this sort of river robbery in every way. A word to the wise! It is a delicate question; but it is high time that somebody spoke out and in no uncertain terms.

Having disburdened my soul of a heavy load, I will now pass to a pleasanter subject. Probably the secretaries of all angling clubs in the metropolis and elsewhere might, during the recess forward to the Editor of the FISHING GAZETTE the aggregate weight of fish caught by the members, and these reports might be tabulated; and then, as time passed, the gross result thus ascertained might serve as a starting point or basis for comparison in future seasons. Trout should perhaps form a separate table, because Mr. Mundella's Act pointed chiefly to the preservation and capture in fair, sportsmanlike angling of freshwater coarse fish.

Of course, no "table," nor homily, could ever do justice to the unalloyed pleasures experienced by each angler in the capture of his individual share of fish. A man might even catch a good creel full who did not belong to any club. His modesty might

even preclude him from mentioning his success beyond his own relatives or friends, or even only to his own wife and children, with whom he had possibly shared the wholesome fish dinner. But he (and every other angler) will, at the close of the season, recall with renewed pleasure the recollection of this good day and that good day, lovingly treasured up on the table of the memory in the long summer time, or in the golden harvest season, when the big fish bit freely, and all around in rural England made his heart leap for joy. And when, in the dim twilight, he had returned home and to his duties next day, he had felt better in health, and thankful to God for the blessings of existence, and for the time certainly not spent in vain!

Some of the correspondents of this journal might also give their experience as to the best modes of cooking the different sorts of freshwater coarse fish. Persons living in seaport towns know well enough that sea-fish are never so good as when cooked immediately they are brought ashore stiff and bright from boat or from smack. Some persons, in the West of England especially, affirm that a hooked fish is of finer flavour than a trawled one. These people say that half the fish sold in the London shops, or on the "costers'" barrows, are spoilt from being so soddened with water. There is a good deal of truth in this, no doubt, but it is perhaps often well-nigh unavoidable. All I know is, that years back I have had cooked many a nice lot of dace, or roach, or perch, and gudgeon, &c., only a few hours after capture, and can attest the advantage of not keeping freshwater fish long after their being caught.

AN OLD ANGLER.

THE ROYAL VISIT TO THE FISHERIES EXHIBITION.

THE Mayor of Norwich stated that last Saturday he and other gentlemen had an interview with Lord Suffield and Mr. E. Birkbeck, M.P., in reference to the forthcoming visit of the Prince and Princess of Wales to Norwich on the occasion of opening the Fisheries Exhibition, and on Monday he received an intimation from Lord Suffield to the effect that their Royal Highnesses will be most happy to attend the opening of the Exhibition on the 18th of April. The Royal party will arrive in Norwich at about twelve o'clock and proceed to the Exhibition, after opening which, and remaining there a short time, the Prince and Princess and party will go to St. Andrew's Hall, having done him (the Mayor) the honour of accepting his invitation to luncheon. (Hear, hear.) After the luncheon the Royal party will leave the city by the same route as would be observed on arrival. The Mayor further remarked that an escort would be provided for their Royal Highnesses by the cavalry in the city, and the volunteers would be asked to line the route, and assist in keeping order in the streets; and he was certain his fellow-citizens would show their appreciation of the kindness of their Royal Highnesses by such a demonstration of loyalty as would make the visit a pleasant recollection. (Hear, hear.)

Mr. Stanley asked if it was the intention of the Corporation to encourage the illumination of the old city on the occasion of the Royal visit. He believed there was a feeling in the city in favour of a general decoration and illumination, and he thought the Corporation should set the example by illuminating the Guildhall.

The Mayor pointed out that their Royal Highnesses would have left the city before the evening, so it was thought unnecessary to set on foot a plan for illuminating the city.

Mr. Stevens supposed that the sad occurrence of Sunday would not interfere with the arrangements.

The Mayor replied that the arrangements were made on Monday.

Mr. J. D. Smith said the committee considered that as the Royal

party would not remain in Norwich in the evening, it was undesirable to have any illuminations.

The Mayor remarked that of course if any citizens liked to illuminate their buildings, there would be no objection to it. He hoped, however, bunting and other decorations would be generally employed.

CENTRAL ASSOCIATION OF LONDON ANGLING CLUBS.

IT is satisfactory to find that this Association is occupying a most prominent position, and has obtained all the liberal concessions of the different railway companies to enable it to grant privilege tickets to the members of the numerous angling clubs already affiliated to the Association. Its headquarters are at the Star and Garter Hotel, St. Martin's Lane, Charing Cross, the birthplace of the West Central Association, and of which the worthy and respected host, Mr. F. C. Hatfield, was one of the principal founders, and rendered the most valuable assistance towards its successful establishment. Since its removal from this capital hostelry to increased accommodation, this Association has sprung into active existence, and with the well known energy and determination of Mr. F. C. Hatfield as treasurer, and the untiring efforts of Mr. R. Stebbings as honorary secretary, it is certainly increasing in strength and usefulness. At the weekly meeting of delegates on Friday evening in last week, under the excellent presidency of Mr. J. C. Murray, the handsome sum of ten guineas was unanimously voted to the funds of the Thames Angling Preservation Society, when it was determined to call a special meeting on Friday evening next, to which Mr. Thomas Spreckley and Mr. W. H. Brougham were to be invited to receive the donation. The financial position of this Association is in so satisfactory a condition that it was contemplated to have given a larger sum, but it was afterwards considered advisable first to evidence the regard of the delegates for the valuable preservation of the Thames by the present amount, and on the next occasion to do more.

B.

CORRESPONDENCE.

[We do not hold ourselves responsible for opinions expressed by our Correspondents.]

STOCKING A POND.

SIR,—I am sure you will allow me to make a slight alteration in your reply to "East Sussex" upon the above subject. If his pond be fairly supplied with insect larvæ (and if not he should introduce caddis, the smaller mollusca, freshwater shrimps, &c.), he will find that the *fontinalis* trout will do well. This is the American brook trout, but it has been found to thrive in lakes, especially those possessing shrimps. Minnows, gudgeon, and very small carp might also be introduced as supplementary food for these trout, or he could feed and fatten them himself by means of regular feeding. Perch would do no harm to the trout if the latter were comparatively large to the former small; neither would very small roach, for the *fontinalis* is almost as voracious as the pike: but beware of putting them in of a larger size than your trout, as they are themselves capable of starving trout by their infinite multiplication, and eagerness for insect food. Mr. Andrews, Westgate House, Guildford, will supply the trout.

J. HARRINGTON KEENE.

NETTING.

SIR,—By the time this is in print, the close season for coarse fish will have commenced, and anglers put aside their rods and tackle until June 16, a space of three months which, speaking from my own experience, I have seen quietly accepted with hardly an exception, but in this district the roach do not spawn until June 21st and later, taking the dates of the last few years; it is, therefore a great hardship after conforming, to the Act, to know that quantities are destroyed by the netters at night time after the season is opened.

Can we not stop these nefarious practices by agitating the question now while anglers have spare time on hand, and endeavour to get a small Act passed for the purpose, say

1st. That no one be allowed to use any net, without a license (landing net excepted) subject to a penalty.

2nd. That netting between the hours of sunset and sunrise be illegal, subject to a penalty.

3rd. That the police have power to stop any one between the hours of sunset to sunrise suspected of having nets in their possession, and if so, subject to a penalty.

These are but a few simple ideas that may be enlarged upon, and I should be glad to see some more prominent angler than myself take the matter in hand, and endeavour to break through the ranks of the greatest enemy to all true anglers, the Netters.—I am, &c.

JOS. WILLIAMS, Chairman,

Jolly Anglers' Club, Leicester, March 12.

FISH IN THE THAMES.

SIR,—On Monday, March 14, ended the most disappointing season as far as my own experience goes, that I ever remember upon the Thames. I believe all Thames anglers will bear me out in the belief that the real staple fish for the Thames—jack and perch—have been steadily decreasing in numbers for the last ten years or so, and that the sport to be obtained among them is by no means what it used to be. Piloted by the same experienced veteran in the same parts of the river, and certainly fishing with not less perseverance than before, I have seldom been able to bring home during the three last years more than 4 or 5 lb. of fish in the bag, which ten years ago repeatedly groaned with 20, 30, and even 47 lb. I hear the same tale from everybody about the river. And this, be it observed, has been in spite of the greater care and vigilance exercised in the preservation of the fishing and prevention of poaching the various societies now established along nearly the whole of the river.

I shall be very glad if any of your readers can suggest any probable cause for this, and still more so should the cause suggested prove preventible.

Several changes about the river have been coincident with this progressive deterioration of fishing during the past decade.

1. The steamer nuisance. These horrible monsters doubtless keep the water in perpetual agitation, and so frighten the innocent dears that they have no leisure to look at one's bait; add to which they churn up enough mud for some yards from each bank to make them sick and indisposed to feed for at least some hours after; but this cause would not apply to parts of the river which steamers cannot approach, as the old river below Datchet, the stream from Windsor Weir to the Oak in the Eton Playingfields, &c., in which the sport has fallen off quite as much as elsewhere.

2. The vast increase of legitimate pleasure boats cannot interfere much with the autumn and winter fishing.

3. The diversion from the river of the sewage of most of the large towns on its banks ought, one would have thought, to have greatly increased the productiveness of the water, instead of having the opposite effect, which is hardly credible.

4. The number of anglers has increased very greatly, but not, I think, of those who fish for jack and perch, which involves the hiring of a man and punt for the day's amusement. At least, I do not learn from the professional fishermen that they get more employment than before, or that their number has much increased.

5. It may be questioned whether the practice of netting the ditches in March and April, and returning the fish to the river in order to save them from the wires and other poachers, does not greatly interfere with their natural increase by spawning. It is their instinct to run up the ditches to spawn; and, unless they are able to do so undisturbed, the year's increase must be lost.

6. I do not observe that swans have become more numerous than they used to be. Ten years ago I counted 38 in sight at once (about Queen's Eyot).

7. Three at least of the last five years have been marked by long periods of flood which have kept the river turbid for many weeks, if not months, of each winter. I believe there was no considerable flood between 1852 and 1875. Perhaps this may have something to do with it.

There are some grounds for hoping that trout are on the increase, though last year's results pointed rather the other way; but it is rapidly becoming a vital question whether fishing for jack and perch in the Thames can any longer be considered a rational use of one's time, money, or temper.—I am, &c.,

Eton College, March 18, 1881.

C. C. JOHNSON.

PITH BAIT.

SIR,—Can any of your readers inform me how to prepare pith from an ox for chub fishing, and what operation it has to go through—whether anything else is mixed with it or not?—I am, &c.,

T. W. T.

A QUERY.

SIR,—Will you kindly inform me in your next issue the difference between a pike and a jack?—I am, &c.,

NEMO.

St. Andrews, Bristol.

[The only difference is in weight. A jack is a small pike and a pike is a big jack. At what weight the change in name occurs seems uncertain.—ED.]

TROUT-FISHING WANTED.

SIR,—Will you have the goodness to insert the following in your paper?—Will any reader of the FISHING GAZETTE recommend good trout-fishing between Peterbro' and Great Grimsby, on the Great Northern Railway, and the best season and accommodation?—Yours, &c.,

SALMO FARIO.

FISHING IN THE RODING.

SIR,—I am innocent of any practical knowledge of angling, but I think I can answer the query put to your readers by "Merlin." I travelled from Loughton to London, three weeks ago, in company with an angler whose day's "take" consisted of a half-a-pound roach. This he said he had caught in his favourite quarters, a mill-pond on the Roding, a couple of miles above Abridge, and the fishing was free. Theydon is the nearest station,—I am, &c.,

15, Wellington Road, Stoke Newington, N.,

FREDERIC JOHNSON.

March, 16, 1881.

FOSTER FUND.

SIR,—I beg to acknowledge, with thanks, receipt of £1 1s. from the Westbourne Park Piscatorial Society, £1 2s. from the Social Brothers A.S., 10s. from the Acorn A.S., 6s. from the Bloomsbury Brothers A.S., towards the above fund.

Secretaries are respectfully requested to send in their lists on or before the 29th inst.—I am, &c.,

T. HOOLE, hon. sec.

PRESERVING MINNOWS.

SIR,—In replying to your correspondent, L. Fisher's, communication (and your footnote thereto) desiring information as to the mode of preserving minnows for spinning. I may say that the plan adopted in the North of England is simply followed because it is a ready and cheap one; but I deny that they are tough or bright—quite the contrary: they break if you are not careful in putting them on the hooks, and they are of a dull leaden hue and as wrinkled as a centenarian. I would advise your correspondent to use a glass pickle jar and half fill it with methylated spirits of wine, and either drop the minnows in alive, or, at all events,

whilst bright and fresh, stop up the bottle to prevent evaporation, and at the end of five years or more they will be found to be tougher—quite as plump and nearly as bright as when first put in. I have a few left now that were so treated nearly seven years ago, and I will back their appearance and baiting qualities with the fresh ones. My thanks are due to Mr. Francis Francis for this "wrinkle."—I am, &c.,

J. T. HORSLEY.

Southport, March 15.

THE "FISHERMAN'S MAGAZINE."

"Blue Dun" asked about this last week. We now find that a magazine under this name has just been started by Mr. Ohlson, of Grimsby.—ED.

A GOOD SUGGESTION.

SIR,—I was much interested in the papers which appeared last year in the FISHING GAZETTE on matters connected with fly-fishing, and I write to express a hope that, with your kind permission, some of your able contributors will give us this season a series of entomological papers in connection with fly-fishing.—I am, &c.,

X.

THE MUNDELLA ACT AN ANNOYING FARCE.

SIR,—Surely the close season must have commenced, was the thought (not far wrong) of the writer, on the first Sunday of January, finding only one angler besides myself on the Paddington platform for the 9 a.m. train, where there are generally hundreds. Fortunately for the absentees, they had good information, or judged more correctly than we, for it was water, water everywhere; no getting near the river, as had been the case several times previously this season. Then followed frost, snow, and floods again; and now, just as the rivers are getting into condition and the weather delightful, all places except private waters are closed, by Act of Parliament, against fish in prime condition, viz., carp, bream, tench, chub, and roach. Not one of these may be angled for, although allowed in some cases to be taken with the nets.

Of what use is it to fence canals and places against the rods, while these very places are allowed to be netted to supply zoological gardens, aquariums, &c.? Surely fencing the Thames and the Lea, ought to be sufficient for London anglers. It will now be at least four or five months before angling will be worth notice again. Then three out of the four Bank holidays are no good. Christmas floods, Easter or Whitsuntide shut out by Mundella. Mr. Editor, I am one of those that think the Mundella Act an annoying farce.—I am, &c.,

SHUT OUT.

March 16.

[We confess we have also for some time past looked on the Mundella Act as an "annoying farce," and heartily wish it had never been heard of. London anglers should remember the Welsh Harp and other similar private waters are not affected by this Act.—ED.]

LONDON WATERS.

SIR,—Can any of your readers kindly inform me if any one is allowed to fish in the Ornamental Waters, Regent's Park, and the Serpentine in Hyde Park? Also in the New River, at Stoke Newington? Awaiting a reply.—I am, &c.,

YOUNG PISCATOR.

CLUB REPORTS.

ALEXANDRA SOCIETY OF ANGLERS.

Last Sunday decided a series of prizes lasting some weeks. The following is the result:—On Sunday, Feb. 27th: Mr. T. W. Thompson won Mr. Shepherd's prize, Mr. E. Dymond won Mr. H. Shaw's prize, Mr. J. Morgan won Mr. G. Castle's prize. On Sunday, March 6th: Mr. Blackledge won Mr. Tomkin's prize, Mr. C. Hewett won Mr. Blackledge's prize. On Sunday March 13th: Mr. J. Blackledge won Mr. Hussey's prize, Mr. J. Thinkettle won Mr. Thompson's prize, Mr. J. Miles won Mr. Gripton's prize, Mr. T. Gripton won Mr. J. Morgan's prize. The following had some fine fish:—Mr. E. Brockett roach and dace, 6 lb. 10 oz.; Mr. W. High, roach and dace, 5 lb. 15 oz.; Mr. J. Morgan, roach, 4 lb. This being the winding-up of the fishing in our club, we shall be most happy to see any angler and friend on Monday, March 21st, at the Duke of Wellington, Three Colt Lane, Bethnal Green, as we have a fine concert, Mr. S. Collier in the chair, and he has promised to bring the Maid and Maggie with him.—C. HARTLAND, sec.

AMICABLE BROTHERS' ANGLING SOCIETY.

The members fished a pegged-down match at St. Margaret's for twelve prizes, only seven of which were won. Mr. Harding 1st, Mr. F. Plumstead 2nd, Mr. Story 3rd, Mr. Breasley 4th, Mr. Sinclair 5th, Mr. T. Lake 6th, Mr. A. Plumstead 7th. Mr. F. Arnold fished for the match to the finish without getting a nibble, when he got a very nice roach, which weighed 1 lb. 2½ oz., winning a prize given by Mr. Smith for the heaviest roach from the tow path only. The visit on No. 2 District of the W. Association will take place on Monday, March 21st, in the club-room.—T. WORLEDGE.

Sunday, March 13.

ANCHOR AND HOPE ANGLING SOCIETY.

A match took place on the 13th March, and some fine shows of fish.—G. Taylor, first; J. Ball, second, W. Streaton, third; A. Shakel, fourth, and several others weighing in fish.—A. SHAKEL.

THE ANGLER'S PRIDE ANGLING SOCIETY.

On the 13th, the members had their last outing of the season, and met with capital sport. Mr. Watkins had a pretty basket of perch, weighing 4 lb.; but the best show was Mr. Dobsson's four perch, weighing 3 lb. 8 oz. Mr. Mallet, Mr. Hayes and Mr. Scutt weighed-in some very fine roach, some weighing 1 lb. 2 oz. each; Mr. Hines, roach and dace; Mr. Soar, ditto; Mr. Wall, roach; Mr. Marshal, ditto; Mr. Dealy, ditto; Mr. Fiddes, dace. Several other members weighed-in, but the takes were small.—THOS. FIDDES.

March 14.

ANGLERS' BENEVOLENT SOCIETY.

The Committee, at the request of several of the angling societies, have decided to extend the time for the return of the tickets for the draw for the two paintings presented by Greville Fennel, Esq., to Friday, March 25th. Tickets not paid for by that date will not be drawn for. Due notice will be published

of the winning number. The committee beg to inform the angling societies that they have provided boxes for the collection of donations to be placed in the various clubrooms. Secretaries may be supplied on application as above, on the second or fourth Friday in the month, or to the general secretary, R. Ghurney, 10, Baches Street, Charles Square, Hoxton, N. New Foresters' Hall, Clerkenwell Road, Clerkenwell, E.C.

BATTERSEA PISCATORIAL SOCIETY.

The members of this society fished for three more prizes on Sunday last at Garratt Park. The successful competitors are as follows: Sir Trevor Lawrence's prize, Mr. Newman, hon. sec.; Mr. Willoughby's Prize (value £1 is.), Mr. Hawkins; Mr. R. A. Banfield's Prize (value 15s.), Mr. R. Banfield. I am sorry to say that owing to the recent bad state of the water and the bad fishing season in general, we have been unable to compete for the remaining seven prizes. Due notice will be given of our supper, which would have come off before this, but our patrons, Sir Henry Peek, Bart., M.P., and Sir Trevor Lawrence, Bart., M.P., were unable to attend.—C. NEWMAN, hon. sec.

BOSTONIAN ANGLING SOCIETY.

We had a good show on Sunday last, the following fish being weighed-in:—Mr. Vincent, 8 lb. 4 oz. roach, and one jack, 3 lb. 14 oz.; Mr. Bell, 8 lb. roach and perch; Mr. Seymore, a pretty jack; Messrs. Jennings, Goodge, Harris and Dillon, roach. On the 14th inst., Mr. Collier, 15 lb. 14 oz. roach and perch, six largest roach, 6 lb. 2 oz.; Mr. Beswick, 12 lb. 10 oz. roach and dace; Mr. Bell, 6 lb. 9½ oz. roach.—H. TAYLOR.

CENTRAL ASSOCIATION OF LONDON ANGLING CLUBS.

The delegate meeting of the above took place on Friday last. During the evening £10 10s. was voted to the T.A.P.S. Thomas Spreckley, Esq., and Mr. Brougham are invited to attend on Friday, March 25th, to receive it, when they will address the meeting (?).—R. STEBBINGS.

CLAPHAM JUNCTION ANGLING CLUB.

The members of the above club competed for the remaining prizes on Sunday and Monday last, which ended the season, with the following result:—Mr. W. Maslin being first, with jack and perch, 6 lb. 7½ oz.; Mr. E. Wakeford second, with roach; Mr. T. Sutters third, with roach and bream; Mr. E. Wilson fourth, with roach, dace and perch; Mr. C. Blunder fifth, with roach. The other takes were not very large, the last being 1 lb. 15 oz.; all the prizes fished for being taken—which finished the season very satisfactorily to all the members, who showed up in good force on the last day. The annual dinner and presentation of prizes will take place on April 6th, at the club-house, Lord Ranelagh.—E. WILSON, sec.

CITY OF BRISTOL ANGLING ASSOCIATION.

On Sunday, March 6th, the first peg-down match took place at Timply Stoke, when nineteen members entered their names to compete. On Saturday there were doubts as to whether it would take place on the following day, owing to the wet weather; but, however, I am pleased to say it turned out to be a very fine day, and the contest took place as arranged, when the following members took part, and won in the order of their names:—Messrs. C. Osceham, W. Lynch, W. Thomas, R. Edwards, W. Hisgrove, Nash, J. Sampson, T. Hovey, H. Parsons, W. White, Stingwood, A. Hill, Billingham, and Parrot. The fish having been weighed, our members returned to the Aqueduct Inn for refreshment; then a pleasant walk to Bath, and a ramble through the city to see the Bath beauties. At last time was called for returning home, and on arriving at Bristol found several friends of the Golden Carp and others anxious to know the result. On reaching the club-house we were heartily received by our worthy host and numerous friends, and thus passed the first contest of our association. On Monday evening, March 7, there was a special meeting of the association, when there was a large attendance of members, the president in the chair, when the prizes were distributed by the chairman, who, in the course of his remarks, said he was very pleased with the result of the previous day's work, and announced that he hoped the next contest would come off about the first Monday in August—that being Bank Holiday—when he expected a much larger entry of members to contest. A vote of thanks was then proposed to those gentlemen who had kindly given the prizes. Several members sang some capital songs, and thus wound up a very pleasant evening.—J. H. STANTIAL, sec.

CITY OF LONDON ANGLING SOCIETY.

A few of our members fished a pegged-down match at Watford, near the Halfway house, on the 13th, the result being very unsatisfactory, one large prize only being won by Mr. Plumstead, sen., five of them must stand over for next season; the fish were dead off; jack were very plentiful, several being taken in the open spaces between our men. Three members, Messrs. Pratt, Johns and Chambers, jun., weighed in bream and roach from Amberley. Mr. Fowler had a pretty jack from the Colne, 7 lb. 4 oz., which has been sent to Cooper for preservation. Our return visit (eastern district), will take place on Tuesday next, the 22nd, at our club house, Coger's Hall, Bridge Lane, Fleet Street, five minutes' walk from Farringdon Street, and fifty yards from Ludgate station. Any club in or out of the district visiting us will receive a hearty welcome, also a visit in return. Mr. Fowler, of the Sir Hugh Myddelton, will take the chair.—CAS.

CLERKENWELL PISCATORIALS.

The members were out fishing for a number of prizes on Sunday last. During the evening the trays got filled with some nice specimens of fish. The next return visit will take place at the above club on Monday next, the 21st.—R. STEBBINGS.

THE DALSTON ANGLING SOCIETY.

The show of roach and perch at this club house on the 13th inst. was a sight worth seeing. The principal contributors were—Mr. Eagles, roach; Mr. Anderson, roach; Mr. Warman, perch; Mr. Fortescue, roach; Mr. James, perch; Mr. Legge, perch; Mr. Venour, roach; Mr. Lester, perch; Mr. Midson, perch; Mr. Bunn, roach; Mr. E. Kidd, roach; Mr. Finch, roach. Several other members also weighed-in. The top weight was 10½ lb. roach, taken by Mr. Eagles in the Lea. On Monday, the last day of the season, Mr. Lassetter had 17 lb. roach, and Mr. Fortescue had 11 lb. roach, thus winding up the season in a highly satisfactory manner.—W. L.

March 14.

EUSTONIAN ANGLING SOCIETY.

On Sunday, the last of the season, we had a splendid show of fish, Mr. Hornfeck leading with over 11 lb. roach, perch, and chub; Mr. Clements with

a show of roach; Mr. Meek with some nice roach; Mr. Percy, roach; Mr. Steadman, perch and roach; Mr. Neal, perch; Mr. Lawrence, perch; Mr. Howell, roach; all the others had something.—W. COSTER.

March 14.

EXCELSIOR ANGLING SOCIETY.

Last week being the last of the season, a good complement of members were out. Amongst the most successful was Mr. T. Heywood, who weighed in from private waters 15 lb. of splendid roach and 12 lb. of perch, the four largest weighing 9½ lb., the largest scaling exactly 3¼ lb. These were sent to Cooper's for preservation. Mr. Smith had a fine show of roach; Mr. Hopkins, jack and perch; Mr. Blackman, three jack, largest 5 lb.; and many other members weighed, altogether making a very satisfactory termination to season.—R. WARD.

GLOBE ANGLING SOCIETY.

The members of this society were out on Sunday the 13th, and rewarded with some very excellent baskets of fish, Mr. W. Moore winning a valuable prize with 12 lb. of barbel from the Thames. Mr. J. J. Holmes some handsome roach and barbel, Mr. C. Russell some good roach from the Colne, several others contributing, making altogether a good finish to a bad season.—J. CHURCHMAN.

March 14th, 1881.

GOLDEN TENCH.

The 13th of the month being our last members were out in force, and some of them, wishing to get a show of fish, missed their train, and were too late to weigh their fish. Messrs. Flower, jun., Flower, sen., and Mr. Webb weighed in from St. Margaret's; Mr. Flower, jun., roach 7 lb.—one fish 1 lb. 3 oz., Mr. Webb roach 12 lb. 3 oz., Mr. Byden roach, Mr. Higley ditto, Mr. Brown ditto from the Grand Junction Canal.—T. S. WEBB.

March 15.

GREAT NORTHERN BROTHERS ANGLING.

The members tried hard to obtain a good show of fish for our last day for weighing-in (Sunday, March 13th), and they succeeded beyond expectation. The weight of fish shown was the best we have had for a considerable time. Mr. Theobald headed the list with a splendid tray of roach, weighing 18 lb. 8 oz. one fish weighing 1 lb. 3½ oz.; Mr. Dingley roach, 18 lb. 4 oz.; Mr. J. K. Fitch roach, 6 lb. 8 oz. From the Thames: Mr. J. Watling, 7 lb. roach; Mr. C. Hill, 2 lb. 8 oz.; Mr. C. Warren, 2 lb. 6 oz.; Mr. Walker, 2 lb. 4 oz.; Mr. Young, 4 lb. 2 oz.; Mr. Newman, 9 oz.; Mr. Page, 12 oz., from the Lea: Mr. Perkins, 1 lb. 3 oz.; Mr. Painter, 13 oz. From the Grand Junction Canal: Mr. Juber two chub, 5 lb., one a handsome fish, 3 lb. 8 oz., will be preserved; Mr. Stammer chub, 1 lb. 11 oz.; Mr. Mayes chub, 15 oz.; Mr. Parrin, 11 oz. roach; Mr. Phillips, 1 lb. 1 oz.; Mr. Smith, 9 oz.; Mr. Cowper, 9 oz.; Mr. Pica, 13 oz.; Mr. Reynolds, 15 oz. Total, 67 lb. 1 oz.—J. FITCH, hon. sec. P.S.—We had two good shows of roach on Monday, Mr. T. Watling having 12 lb. 13 oz.; Mr. J. Fitch, 10 lb. 3 oz., one fish 1 lb. 1 oz.; Mr. C. Watling, jun., also showed 8 lb. 1 oz.

March 15.

HAMMERSMITH UNITED.

On the 10th, we had upwards of 80 lb. of fish, weighed-in as follows:—Mr. Johnson 7 jack, 26 lb. 4 oz.; Mr. Penney 2 jack, 5 lb. 2½ oz.; Mr. Marsh 3 jack, 8 lb. 11½ oz.; Messrs. Geen and Hoole roach, chub, perch, &c., 38 lb. 14½ oz.; Mr. Walters dace, 1 lb. 14½ oz. A tray selected from the above was sent for the use of the patients at the West London Hospital. Mr. Gatward, fishing at Maidenhead, succeeded in landing two barbel and three roach. On the 13th the following fish were forthcoming, viz., Mr. Pitts, roach from Henley; Mr. Rackstraw, two jack; Messrs. Penney, Hitchcock, Lewis and Marsh weighed-in roach and dace. To close the season, I have the following catches to report:—March 14, Mr. Aldridge, roach, chub, dace, and perch, 12 lb. 10½ oz.; Mr. Walters, dace and chub, 4 lb. 12 oz., from private water; Mr. Arnold, jack and perch from the Wey; Mr. Mackness, perch and roach from Hurley.—VORTEX.

HAMPSTEAD ANGLING SOCIETY.

The members of the above society were out in strong force on Sunday last to compete in a peg-down match at Watford, and also to weigh-in for other prizes. Mr. W. Hall succeeded in taking first prize, presented by Mr. Roberts, of the Good Intent, the others not being taken, owing to the fish being, as often occurs, dead off. Messrs. Lane and Winyard also showed up some very nice roach and perch from the Canal near Uxbridge, Mr. Lane coming to the front with a very pretty tray of roach, weighing 6 lb. 14 oz.—T. J. STEDALL, secretary.

March 16th.

IZAAK WALTON ANGLING SOCIETY.

Yesterday (Sunday) being the last in the season on which members can weigh-in fish, there were four special prizes competed for. Mr. G. Wood was first with 2 lb. 15¼ oz. of roach and perch; Mr. H. Auburn was second with 2 lb. 2¼ oz. of chub and perch, Mr. B. Crook was third with 1 lb. 8¼ oz. of roach, Mr. G. Manning was fourth with 1 lb. 7¾ oz. of roach. The weights following the winners were very close; Mr. W. Mechem had 1 lb. 7 oz. of roach, Mr. A. Salmon had 1 lb. 4¼ oz. of roach. Messrs. E. Morrow, S. Wilkinson and J. Barnes also had fish; there were several other members out, but their takes were so indifferent they did not weigh-in. The members are requested to notice that the meetings will be as usual during the fence months.

March 14th, 1881.

THE LITTLE INDEPENDENT ANGLING SOCIETY.

We had a fair show of fish on our tables on Sunday night, and the six prizes we had out for competition were won. The winners were:—1st prize, a Silver Cup (presented by Mr. Castle), Mr. Blenheim, 4 lb. roach; 2nd prize, Mr. Watson, 2 lb. 4½ oz. roach; 3rd prize, Mr. Hurwood, 1 lb. 5½ oz. roach; 4th prize, Mr. Parker, 1 lb. 3½ oz.; 5th prize, Mr. Mead, 1 lb. 1½ oz.; 6th prize, Mr. Moore, 8 oz. The following members likewise weighed in:—Mr. Humphreys, roach and 1 lb. 5½ oz. perch; Messrs. Aymes, E. Barr, Harbert, Watts, Petrie, Grey, and Castle.—W. BROWN, hon. sec.

March 16.

PISCATORIAL SOCIETY.

At the Piscatorial Society on Monday, there was a good show of fish. Messrs. Harrison and Brown weighed three roach, 1 lb. 8 oz., and showed five

perch, 2 lb. 13 oz., the latter not weighable after the end of February; Mr. Harrison also one tench, 2 lb. 4 oz. from the Thames; Mr. Lemann, two roach, 1 lb. 4 oz., six perch, 4 lb. 4 oz.; Mr. Lander, one perch, 11 oz., and 10 lb. weight of barbel; Messrs. Walker and Carter, roach, 8 lb. 12 oz. from the Thames. Messrs. Andrew's and Patterson showed 25 lb. weight of pike; Mr. Harrison occupied the chair in the early part of the evening, filled later on by Mr. Patterson. Mr. Harrison had to leave to be present at a meeting of the Rifle Association. There was a good attendance of members including Messrs. Peiree, Gillott, Rolfe, Faulkner, Jardine, Gray, Lemann, Goodger, and many others. Dr. Brunton and Mr. Chatterton were proposed as members and thus ended a very pleasant evening.—W. B. A.

March 16.

PORTSMOUTH WALTONIAN ANGLING SOCIETY.

Sunset to-day sees the close of the season for freshwater fish, and for members of the above society it has been a very poor one. With the limited nature of available fishing ground the members possess, and the past bad season, we shall not be able to make such a good record as the preceding year. This week I have to record the capture of a fine specimen of the English carp, weighing 6 lb. 8 oz., by Mr. Brough. It has been sent to Mr. Sanders for preservation. Mr. Ritchie, two small jack of 4 to 5 lb. each also bream and roach; Mr. Mortimer, roach and bream; Mr. Hollanders and Mr. Smith, carp from Bognor, one of 3 lb. and the other 3 lb. 9 oz. The society holds its fifth anniversary dinner on the 17th inst., when his worship, the mayor (W. Pink, Esq.), will preside. Invites have gone forth to the élite of the angling world, and a very enjoyable evening is expected.—WM. TRANTER, sec.

March 14.

RICHMOND PISCATORIAL SOCIETY.

On Saturday last, March 12, the members of the above society celebrated the closing of the fishing season by having a sweepstake match. It was first arranged to have the competition confined to the Thames, but owing to the flooded state it was abandoned, and the competitors allowed to fish where they liked, all fish to be weighed-in by 9 p.m., by that time the result was G. Nat-tress, 9 lb. 3 oz. barbel; A. J. Little, 8½ lb. roach; H. E. Gaynor, 3 lb. 10 oz. jack; J. Brooks, 3 lb. 10 oz. roach and dace; and F. C. Clench, 1 lb. 15 oz. barbel. After the weighing was over, the competitors and some of the members sat down to a substantial supper, Mr. F. Clench occupied the chair, and Mr. J. Dean the vice-chair. After the cloth was removed the following toasts were proposed from the chair:—"The Queen and Royal Family," "Success to the Richmond Piscatorial Society," "Health of the Winners," responded to by Mr. A. J. Little; the "Health of the Chairman," proposed by Mr. Nat-tras and responded to by Mr. F. C. Clench; "Health of the Losers," proposed by Mr. A. J. Little and responded to by Mr. I. Dean and Mr. Owen Davis in some very laughable speeches; the "Health of the Treasurer, Mr. Thomas Abbott," proposed by the Chairman, who said, although not with them this evening, through the loss of his only son, being an honorary member of the society they could do no other than drink his health, and direct the secretary to write to him expressing their sympathy with him in his bereavement; Mr. Dean proposed the "Health of the Secretary," and was responded to by Mr. J. H. Gaunt; Mr. Dean proposed "The Host," and was responded to by Mr. Monro, who said since he opened the Station Hotel he had always tried to do things as well as they possibly could be done, and at a reasonable price, and any proposals from the members of the Richmond Piscatorial Society for the benefit of their club he should be pleased to carry out. Messrs. F. W. Crew, Owen Davis and A. Harwood gave some capital songs during the evening, Mr. F. W. Crew presiding at the piano.

SIR HUGH MYDDELTON ANGLING SOCIETY.

The last match of the season for money prizes by members of the above society took place at Shiplake, on the 13th inst., the coin was divided into five prizes. The landlord of the Empress of Russia, Mr. Crozier, our treasurer, kindly gave us a donation in cash to swell the amount, as is usual in nearly all such matches. The takes were very small. There were two little evils against us—the river was running like a race-horse, if I may use the term, and the wind set dead east; in fact the roach were right off feed, still we managed to take all the prizes. 1st prize, B. B. Duncan; 2nd, Will Fowler; 3rd, J. Caborn; 4th, Jas. Billings; 5th, P. Rogers. The annual supper will take place on the 30th of March, Wednesday, eight p.m. sharp. Friends will kindly make a note of this.—J. CABORN.

March 14.

THE SPORTSMAN'S ANGLING CLUB.

Several of our members have been having good sport to wind up the season with. On Thursday last Mr. Parfitt had six jack and one eel of over a pound; and Mr. Fisher a nice jack. On Sunday Mr. Fisher had roach; also Mr. L. Pommerat a nice show. On Monday, Mr. A. Hodgkinson three jack—one going 14½ lb.; Mr. Green had 13 lb. of fish, including a chub of 3½ lb.—A. WILKINSON, hon. sec.

STEPNEY ANGLING SOCIETY.

On Sunday last, the 13th inst., the members of this society brought the season to a close with a small show of fish, the principal contributors being G. Marrows, 10 lb. bream; B. Lees, 7 lb. bream; F. Jewson, 3½ lb. bream; C. Ruston, roach; C. Pross, 2 lb. 9 oz.—E. R. PEIRCE.

STOKE NEWINGTON ANGLING SOCIETY.

The close of the angling season in the River Lea has fully borne out the character of the preceding portion, which, as regards sport, has proved with few exceptions most unproductive. The following is the takes of fish I have to record since my last week's report:—On the 10th inst., Mr. T. Gretton, 2 lb. 9 oz. roach; Mr. Ed. North, 2 lb. 5 oz. roach. On the 13th, Mr. North, 1 lb. 6½ oz. roach; Mr. Webb, 12½ oz. roach; Mr. Gretton, 12 oz. roach; Messrs. Parrott and A. Pannell were also out, and saved a blank with one fish each. In taking leave of you for the next few weeks, allow me, on behalf of myself and brother members, to very kindly thank you for the complete manner you have reported the doings of the above club during the past season.—THOS. GRETTON, secretary.

March 15.

TRAFALGAR ANGLING SOCIETY.

There was a good show of fish at this club on Sunday last from the Thames. R. Gaze, roach and perch; W. Rawlinson, roach; Smith, Oliphant, and Inglis, dace. N.B.—After the 4th April next the meeting nights will be altered from Monday nights to Wednesday nights.—R. GAZE, sec.

16th March.

WALTONIAN ANGLING SOCIETY.

Last evening the closing night of the season (as far as our weighing-in is concerned), witnessed a numerous gathering of members and friends who were gratified by the sight of full trays, most of the members who had been out having been lucky enough to secure a show of fish. Mr. Roland was champion with 14 lb. 12½ oz. of roach; Mr. Malcolm next, with 6 lb. 7¼ oz.; Mr. Greenfield, third, with 3 lb. 6 oz. The following gentlemen also weighed-in fish:—Mr. Packman, Mr. Starr, Mr. Togwell, Mr. Rushbrook, Mr. Little, Mr. Leader, and Mr. Morris.—A. J. MARRIOTT.

P.S.—We shall not be able now for three months to catch any fish, but I hope if any netters are about we shall be able to catch them. Vigilance is specially necessary during the close season.

WALWORTH WALTONIANS.

The final competition for the season 1880-81 took place among the members of the above society on the 11th. Results as follows: 1st, Mr. C. Bansback, with 10 lb. chub and perch from the Kennett, which entitled him to £3 3s., given by Mr. J. Collins; 2nd, Mr. Bayley, 8 lb. of roach from the Lea, £2 2s., given by Mr. J. Frith; 3rd, Mr. Beale, 6½ lb. roach from the Thames, £1 1s.; 4th, Mr. R. Cain, 6 lb. 5 oz. perch from the Kennett, £1 1s.; 5th, Mr. Howard, sen., dace from Richmond, £1 1s. The following gentlemen also weighed-in fish: Messrs. J. Collins, Howard, jun., Boalch, Weatherhead and Delehay—gross weight of all fish about 20 lb.—PIXIE.

March 16.

WESTBOURNE PARK PISCATORIAL SOCIETY.

The members of this flourishing society wound up the season with an open match on Sunday, 13th inst., when £6 19s. in cash, and several handsome prizes were fished for. The winner proved to be Mr. T. Hawkins, sen. (a veritable little demon), who displayed a fine show of jack from Slough, which entitled him to the 1st prize, value £2 12s. 6d.; Mr. Yarham secured the 2nd prize, £1 15s., with a handsome tray of roach from the Colne; Mr. Hare captured the 3rd, value £1 5s.; the chairman (Mr. Geo. Evans) landed the 4th, value 16s.; the 5th was awarded to Mr. Bayford, value 10s. 6d.; the 6th was received by Mr. Severn, in the shape of a valuable footstool; the 7th resulted in a tie between Mr. R. Rogers, and Mr. Fogarty, both gentlemen weighing 3 lb. 2 oz. It was agreed to weigh the fish against each other, when the scale turned in Mr. Rogers' favour, and a landing net and bait kettle became his property. Altogether the match was an unexpected success, seventeen members weighing in fish. The total weight was 59 lb. 14½ oz. The billiard saloon was used for the occasion, and every arrangement made to secure the comfort of the members and visitors.—GEO. ARCHER, sec.

NORWICH ANGLING CLUB.

The members of the above club held their monthly meeting at their clubhouse, the Walnut Shades, on Monday evening last. In the absence of the president (S. Grimmer, Esq.), Mr. G. Diggins (vice-president) occupied the chair, and Mr. George Daniels the vice-chair. There were also present Messrs. W. Povart, John Womersley, J. Hosken, J. L'Estrange, C. J. Greene, T. Lord, F. Fitt, Charles Daniels, S. F. Hewitt, T. E. Gunn, M. Bailey, O. Winter, A. Cox, W. Burridge, Wm. Cooper, R. Moll (hon. sec.), &c. After the business of the evening had been disposed of, the chairman congratulated the members who took part in the pike-match on the excellent sport they enjoyed and upon the arrangements, and all the competitors expressed themselves as greatly pleased with this new feature of the club. Mr. T. E. Gunn kindly read an interesting paper on "Local Aquatic Fauna." He gave an exceedingly good account of the various fishes that had passed through his hands as a taxidermist, exhibiting upon the walls of the room the outlines of large pike, bream, &c. He gave descriptions of thirty pike caught in Norfolk waters, varying in weight from 16 lb. to 36 lb. The largest fish he had had to deal with was caught rod-and-line fishing by a member of this club (Mr. Frank Thorn). One singular thing about the large pike was that of the twenty largest all were females except one, and that single male was caught by a lady, the other nineteen being landed by gentlemen. Mr. Gunn showed some capital drawings of the various fishes noticed by him, and also of the intestines of a pike, showing the way the tapeworms arranged themselves in this fish. The largest bream that had come under his notice, and he believed he might call it "the champion of England," was one caught a short distance from Cromer, and weighed 10½ lb. He had made inquiries respecting the age of this fish, and from the information he had received, he believed it must be at least fifty-six years old. Mr. Gunn concluded his most satisfactory paper, which lasted nearly an hour, by promising another instalment on the same subjects another time. Much applause greeted him, and a discussion on one or two doubtful points took place to the mutual benefit of those present. The chairman, in proposing a hearty vote of thanks, remarked that Mr. Gunn must have devoted considerable time and trouble to compiling the facts which he had so ably brought before the club, and that the best thanks of the members were due to him for his paper, and there was no doubt the specimens of the art of taxidermy, which Mr. Gunn would exhibit at the forthcoming exhibition, would reflect the greatest credit upon him. The hon. secretary (Mr. R. Moll), seconded the vote of thanks, referring to Mr. Gunn in eulogistic terms as one whose knowledge of the subject dealt with in his paper was very large, and for whose zeal on behalf of the club he cordially thanked him. A vote of thanks to the chair and vice-chair closed a most enjoyable evening.—Norwich Angus.

GREGORY'S SPINNING BAITS.—"The Gregory," the "Flexible Cleopatra," the "Oxford," and the "Colorado," pronounced by all Anglers and the Press the best baits invented for salmon, trout, pike, and perch. To be obtained from all respectable fishing-tackle shops in the world, and wholesale from Messrs. S. Alcock and Co., Standard Works, Redditch. Flattering testimonials speaking of the efficiency of the baits have been received from the Right Hon. John Bright, M.P.; Mr. William Bailey, Nottingham; the Rev. E. C. Holt, Teddington; Sir William Calder, Kingston-on-Thames, &c. Gregory's registered Archimedean spinning tackle for pike and trout, now ready, is pronounced by the press the best ever invented. For use with dead bait. The tackle is complete in every respect, and can be adjusted to suit bait of any size. Has been tried with remarkable success.—See that the name "Gregory" is impressed on the Archimedean fins, as inferior imitations are offered for sale, and people are thereby disappointed and deceived. Address, James Gregory, Vyse-street, Birmingham.—(ADVT.)

ANGLERS should always be provided with something to take away the swelling and poisonous effect of the bites of insects. They should also have with them something to apply to a cut or sprain. Pond's Extract reduces the swelling and inflammation, stops bleeding and pain, and hastens the healing process in case of any wound or sprain; and it has no equal for application to the bites and stings of insects. Therefore never go on a fishing excursion unprovided with a bottle of Pond's Extract. It is for sale at all chemists, at 2s. 3d., 4s. 6d., and 8s. 6d. per bottle.—[ADVERTISEMENT.]

NOTICE.

Communications relating to the Literary Department, Fishing Tackle for Notice, Books for Review, &c., must be addressed to the Editor of THE FISHING GAZETTE, No. 12, Fetter Lane, London, E.C. and should reach the office not later than Tuesday morning.

Contributions are solicited, but the Editor will not undertake to return rejected MSS., unless accompanied with a stamped addressed envelope.

Correspondents are requested to write on one side of the paper only and give their real names and addresses, not necessarily as signatures to their letters, but as a guarantee of good faith. Unless this rule be adhered to no notice will be taken of such communications.

THE FISHING GAZETTE is published every Saturday, and can be obtained at Messrs. W. H. Smith and Son's Railway Bookstalls, and of the following, amongst other Fishing Tackle Dealers in London and the Provinces:—

Messrs. Alfred and Son, Moorgate-street.
Messrs. Price and Co., 8, Seymour-street, Euston-square, N.W.
Messrs. Williams and Co., Great Queen-street.
Messrs. Gee and Co., St. Andrew's-street, St. Martin's-lane.
Messrs. Gee and Co., Gray's Inn-lane (near Holborn end).
Messrs. Little and Co., Fetter-lane, E.C.
Messrs. C. Kewell and Sons, 107, St. John-street-road, E.C.
Messrs. Kewell and Co., 1A, Conduit-street, Regent-street, W.
Mr. J. Richards, 97, Church-street, Paddington.
Mr. W. Leader, 30, Upper Marylebone-street, Portland-place, W.
Mr. — Clark, 35, Wells-street, Camberwell.
Mr. Geo. Read, 91, Goldsmith's-row, Hackney-road, E.
Mr. A. Bulmer, 62, Wandsworth-road.
Mr. F. Oliver, 188, Great College-street, Camden Town.
Mr. J. E. Gold, 284, Waterloo-road.
Mr. D. W. Willoughby, 21, Lombard-market, Battersea, S.W.
Mrs. F. Y. Brocas, 4, Mill-street, Conduit-street, Hanover-square, W.
Messrs. Gillett and Co., 40, Fetter-lane, London.
Mr. Alfred Young, "The Golden Perch," 174B, Oxford-street, W.
Mr. T. Barnett, 26, Church Street, Lisson Grove, N.W.
Mr. J. Smith, 7, Tottenham Court Road, London.
Mr. Edwin Stevens, Newsagent, 220, Kentish Town Road.

OR

Mr. B. R. Bambridge, 74 and 75, High Street, Eton, Bucks.
Mr. Cowan, 33, South Frederick-street, Edinburgh.
Mr. H. Whitty, 15, Basnett-street, Liverpool.
Mr. C. J. Greene, 54, London-street, Norwich.
Mr. R. Ramsbottom, 81, Market-street, Manchester.
Mr. James Gregory, Vyse-street, Birmingham.
Mr. Wm. Bailey, Jun., 29, London-road, Nottingham.
Messrs. Nutting and Co., 70, Edgbaston-street, Birmingham.
Messrs. W. C. and J. Penny, Booksellers, Froome.
Mr. E. Perks, Evesham-street, Redditch.
Mr. J. Walsh, Bookseller, 5, Harpur-street, Bedford.
Messrs. H. and C. Treacher, Booksellers, Brighton.
Messrs. Gaynor and Son, 10, Royal-terrace, Richmond, Surrey.
Messrs. O'Hanlon and Co., 48, Victoria and Temple-streets Bristol.
Mr. Wilkes, Gunmaker, Leeds.
Messrs. Cayless and Sons, Midland Tent Works, Loughborough.
Miss G. Wells, 1, Sussex-street, Nottingham.
Mr. Wm. Atkinson, Fishing Tackle Maker, Lancaster and Kendal.
Mr. John Wells, 4, London-road, Nottingham.
Messrs. Mitchell and Co., 50, Market-street, Manchester.
Mr. J. Croisdale, 56, Briggate, Leeds.
Mr. John Keeling, the Golden Salmon, 7, Digbeth, Birmingham.
Mr. John Heywood, Manchester.
Mr. John Cocks, Baker Street, Weybridge, Surrey.
Mr. Wm. Reid, Northgate, Darlington.
Mr. R. Pearsall, 11, Great Western Arcade, Birmingham.
Mr. G. T. Gibbons, 10, Bridge Street, Salisbury.
Mr. Thos. Heppleston, Manchester.
Mr. J. Perry, Minster Parade, Reading.
Mr. S. Dale, 7, St. John Street, Nottingham.
Mr. H. Booth, 88, Prospect Street, Hull.

Newsvendors can obtain the journal through their London Agents.

** The "FISHING GAZETTE" SPINNER (Registered) is sold by all the above firms.

ANNUAL SUBSCRIPTION.

The Annual Subscription, payable in advance, for the United Kingdom is 8s.; or post free, 10s. 6d.

To any part of Europe, the United States, and Canada, the Annual Subscription, including postage, is twelve shillings and sixpence.

ADVERTISEMENTS.

All communications respecting advertisements must be addressed to the Manager of THE FISHING GAZETTE, No. 12, Fetter Lane, London, E.C.

N.B.—All Remittances must be sent, and all Cheques and Money Orders must be made payable to ROBERT B. MARSTON.

The Fishing Gazette.

SATURDAY, MARCH 26, 1881.

MORE FISH FOR THE THAMES.

THE Thames Angling Preservation Society of late years has distinguished itself by increasing the stock of fish in the Thames. It has done it in this way: by the netting of lakes and reservoirs that have either been applied for or placed at the disposal of the Committee by the liberal act of the proprietors who have been impressed with the movements of the society in

this respect, and so evidenced their desire to support it. Amongst the various waters that have been netted may be mentioned, the ponds in Bushey Park and the Home Park, the lake of Mr. Gustav Class, of Twickenham, the Barnes Reservoir, the large lake at Kew Gardens, a portion of the Avon at Ringwood, the lakes at Montreal, Sevenoaks, the large lake of Earl Jersey's, at Osterley Park, and other places, besides the gifts of fish from Mr. Henry Farnell, of Thorpe Hall, near Colchester, and others. The committee have doubtless felt that with the large increase of anglers it was most desirable to increase the stock of fish in the metropolitan river, and although the various waters have been freely given to the society for the purposes of netting there has necessarily been a great expense in the doing of them which should be borne in mind by the anglers, and they should evidence their regard for the important movement by voluntarily coming forward in the way of pecuniary support to the committee. It appears from the Statement of Accounts in the "Blue Book" that the netting expenses of private waters last year amounted to £26, and in addition to this netting, the society has been exceedingly active in the dragging of tributaries and back waters after the subsidence of floods with their own nets, and thousands upon thousands of fish have been so restored to the river. It is no wonder, with all this, and the systematic watching of the tidal waters under the energetic superintendence of Henry Walters, the society's head keeper, that the excellent correspondent of the FISHING GAZETTE at Richmond, in last week's issue, makes this important statement: "This is the eleventh season I have had as a professional fisherman, and it is the best season I have ever had." Bravo, Mr. Bushnell! My response is, "May you have a better one next season!" Thanks to the respected curator, Mr. John Smith, of Kew Gardens, the large lake in the pleasure grounds, has been again offered to the Thames Angling Preservation Society, and the valuable work was once more done on Friday last, under the personal and practical superintendence of Mr. Thomas Spreckley, who was supported by a goodly staff of the committee, consisting of Messrs. H. J. Alfred, W. H. Brougham, F. H. Lemann, Alfred Nuthall, and J. Pattison. The services of Mr. Lewis Gibson and his sons, of Putney, were specially retained to do the dragging, and the fish were conveyed to the boats on the Thames by the society's keepers, and those in the employ of the Thames' Conservancy, under the management of Henry Walters; the curator—Mr. John Smith—contributing the assistance of half a dozen of the gardeners to help in the work. And now, as regards the general result. The weather was truly magnificent and suitable to the occasion. The lake was in splendid condition for netting, being nearly free of weeds. The nets worked admirably, and the sights of fish that were occasionally brought on shore were perfectly amazing, some of the best hauls being loudly and excitedly applauded by those engaged, and the visitors on the occasion; and it was certainly one of the best and most satisfactory day's netting in connection with the Thames Angling Preservation Society. Amongst the visitors present on the occasion were Messrs. J. C. Chubb, T. A. Mitchell, A. J. Little, Dr. Clarke, W. Jones, Clarke, J. Perrin, J. H. Gaunt, H. E. Gaynor, J. Munro, jun., Gold, F. C. Hatfield, J. Gare, E. Hickinbotham, R. Lord, Charles J. Cross, &c. &c. The commencement of netting was fixed for half-past eight o'clock, and at the exact time Messrs. Thomas Spreckley and W. H. Brougham were on the margin of the lake with the netsmen and keepers ready to commence operations, the other helpers and visitors gradually putting in an appearance. The first haul of the net brought out a nice parcel of various kinds of fish, including twenty good jack. The second cast over the same ground was not so successful, but the third draw in another corner of the lake was an excessively large one. As the net was

nearing the shore it was found to possess so heavy a cargo as to require the assistance of some half dozen hands to help in raising it out of the water for fear of breaking the net. The sight of fish was indeed extraordinary, large quantities of very fine bream, some large tench, a number of jack, and thousands of good roach and perch. The next haul was nearly as large, and with a better sprinkling of jack in it. The following cast in some rather shallow water only brought out one fish, the emperor of the state, without any retinue of supporters and unaccompanied by any state ceremony; there he was safely and alone, a monster of 25 lb. weight, handed out of the net by Mr. W. Jones, of the Railway Hotel, Twickenham; and as a memento of his distinguished services his imperial majesty endeavoured to leave him minus his thumb, but he escaped with only the loss of a little blood. Netting continued with satisfactory hauls until one o'clock, when it was ordered by the General, Mr. Thomas Spreckley, to strike colours and adjourn to the shed, where, under the capital catering of Mr. F. C. Hatfield, the men were entertained with some good roast beef, bread and cheese and beer. Several of the visitors brought their own nose bags with them, and unselfishly invited those to help them who had not been similarly thoughtful of a long day. Mr. H. J. Alfred was provided with some first-rate egg pies, the mutton in them largely preponderating; then Mr. F. H. Lemann, in addition to eatables, some A 1 East India sherry. Mr. Alfred Nuthall was not behind with tongue, German sausage, claret and whisky, and Mr. F. C. Hatfield and Mr. E. Hickinbotham, with a goodly supply of fluid in the way of sherry and claret. But it soon became evident General Spreckley would not have too much time taken up in eating and drinking, but affording reasonable time, he mustered his forces and renewed hostilities. The nets were soon in the water again, and satisfactory hauls continued. It was noticed that one of the stop nets had something in it, and acting under the General's instructions, Mr. F. C. Hatfield carefully took it up, and found at the end of the net the Emperor's mate, a splendid fish of 18 lb. It was a difficult task for Mr. Hatfield, but he is always equal to any emergency, and brought the empress on *terra firma* with great and natural triumph, all around exclaiming that Mr. Hatfield was entitled to considerable praise; indeed, it was difficult to tell whether the crowd were more jubilant over the fish or its successful landing. The General, however, rewarded Mr. Hatfield by awarding the highest praise for the scientific manner in which he secured the monster. By this time there was a large attendance of ladies, who appeared deeply interested in the netting. The last haul of the net was made a four o'clock, and the fish, which had been placed in boats suited for the purpose at Brentford Ferry, a short distance from the lake were afterwards taken up the river by one of the Thames Conservancy steam-launches, kindly lent for the occasion, and under the personal direction of Mr. Spreckley, were distributed at Twickenham, and other places higher up the river. The launch was brought to the boats under the personal superintendence of Mr. R. Lord, who accompanied the General and other gentlemen up the Thames. Thus ended a great red-letter day in the annals of the Thames Angling Preservation Society; it will never be forgotten by those who were present, and it will be a source of regret at their absence by many who had been invited to take part in the proceedings. Too much praise cannot be given to Mr. John Smith for the permission and for the assistance he contributed, and also to Mr. Nicholson for his kind interest and attention.

B.

FISH IN LENT.

THE demand for fish during Lent is always greater than at any other season of the year, more especially in countries where Lent is strictly observed. And it is remarkable that England

supplies a large proportion of the food required in even the most distant of such countries. The value of the fish exported from the United Kingdom amounts in the year to about £1,000,000. That sum includes the cost of many thousand barrels of the herrings caught and salted in Scotland and the greater number of the pilchards taken by the fishermen of Cornwall. For the supply of foreign countries cod-fishing is extensively carried on in our seas as well as on the cod-banks of Newfoundland. Salted cod and ling are largely eaten in France and Spain, while the salted herrings from Yarmouth find their way to Cuba and the Brazils. The fish markets of such foreign countries as possess a large seaboard are seen to advantage during Lent, especially when fine weather favours the fishermen. In Paris, the fish-market, at all times worth seeing, is at its best then, many thousands of fish being distributed from it every day. It is fortunate that some of our finest fishes are in season during the spring time, so that people who observe the fast-days of the Church are presented with an excellent choice. Many of the fishes, however, which find a ready sale in the Continental markets would not be consumed either in England or Scotland; yet these, when carefully cooked, are really good food. Cuttle-fish, conger and silver eels, dog and cat fish, as well as numerous other unsightly kinds, are sold in the Parisian Halles Centrales, and great efforts are made by the women of the market to keep up plentiful supplies, no matter how ugly some of the fish may appear. It may be noted that the fish supply of London affords on an average a little over two ounces of fish daily to each person; while in Paris, including the enormous extra supplies provided for Lent, the daily quantity only represents a pound weight for every twenty persons.

Countries which have no seaboard must, during Lent, rely on such supplies of salted or otherwise cured fish as they can procure. In inland Continental countries, where fresh fish are required, reliance has to be placed on the supplies furnished by the lakes and rivers, or on ponds expressly constructed for the breeding and rearing of fish. Previous to the Reformation similar "stews" or ponds were common in England, more especially in inland districts, and interesting remains of them are still to be seen; while many curious industries were originally founded on the Continent with the notion of strengthening the discipline of the Church. Some of these places are even now in existence. One of them is probably unique of its kind, and shows what might be accomplished in a similar direction on our own coasts. The lagoons of Commachio, which are devoted to the culture of eels and other fish, belong to the Pope, the sale of the fish being effected on his behalf during Lent, and there is an unceasing demand for the eels of Commachio all over Italy. The eels which are fattened in the waters ascend in their season from the Adriatic in immense numbers, and are permitted to remain in the lagoons until they have attained a profitable size, other fish being grown to serve as food for them. The large area occupied by the lagoons is divided into what may be called fish-farms, each of which is cultivated by a gang of labourers amenable to a sort of military discipline, who reside in the midst of the waters and are housed in barracks erected on an island. There is a great kitchen at Commachio, which during Lent presents a very busy aspect, many tons of cooked fish being sent out in the course of it. Venice itself originated in the desire to obtain fish for the fasts of the Church. A few fishermen "squatted" on the shores of the beautiful Italian sea in order to fish for the Lombards; the number increased from year to year, unconscious of the work they were doing, until in due time

Venice sat in state, throned on a hundred isles,

and the Venetian fish market, with its choice "fruit of the sea," is to-day a spectacle for all who delight in the picturesque,

Many curious particulars are preserved of the observance of fast-days and the eating of fish in England; and it may be said of fast-days generally that their observance dates from a period of which there are no authentic records. Father Prout, in his "Apology for Lent," refers to fast-days as being in vogue at the Council of Nice. But, on looking back upon some of the old statutes, it almost appears as if the eating of fish was decreed because of the scarcity of flesh-meats. Another notion which developed itself at an early period was that fish ought to be extensively eaten because their capture gave employment to the fishermen, from whose ranks, it speedily became apparent, Government intended to recruit the naval forces of the kingdom. In all the great houses of the country an example of eating fish on certain days of the week was at one time set to the people, just as during a former period the pious monarchs of France publicly dined on fish so that they might by their example promote its use as food. Lampreys at one time were a favourite dish in England, and, cooked in many different ways, were eaten in large quantities. The herring also formed a favourite fast-day dish; it was eaten at nearly every meal, being cooked in pies, or roasted in bundles, fastened with skewers, before a brisk fire. Eels also were in constant use. In various notes of the household expenses of Bishop Swinfield we are told of the uses of eels as fast-day food; they were bought by the stick of a quarter of a hundred, which cost four shillings. Long ago the variety of fishes provided for fast-days was quite as considerable as at present; in the Household Book of the Bishop of Hereford the dietary for Wednesday, Friday and Saturday is laid down as consisting of herrings, eels, lampreys, hake, conger, salmon, wine, and beer. After the fish-days, it is related of the retainers of a great nobleman that when they sat down to beef or mutton "they knew no measure of their stomachs."

In London in the old time the market price of fish was prearranged by authority. Edward III., for instance, issued very stringent regulations for keeping down the prices; while the profits of all fishmongers were to be no more than a penny in the shilling. The following were the market prices:—Mackerel one penny, and turbot sixpence each; soles, twelve for threepence; pickled herrings, one penny per score; oysters, twopence per gallon; and eels, fourpence per hundred. No fish were allowed to be sold that had been more than one day out of the water. During the preceding reign the fishmongers—who by that period had established a flourishing guild—were jealous of their trade being intruded upon by persons selling fish in the City who were not members of the Fishmongers' Company. It was a rule in selling fish for fast-day uses that purveyors of the Court were to be supplied before any of the King's subjects. Most of the great English families were wont at the close of autumn to order their supplies of fish for winter fast-days, these being very carefully stored in dry lofts. It was found at one period a difficult task to keep the people of London faithful to fish diet on fish-days; and it proved still more difficult to persuade them to dine on fish on other days of the week, although every possible argument was used to enforce the sumptuary laws of the time. In the year 1548 a statute was passed ordaining "abstinence from flesh," and imposing penalties on all who ate it on fast-days; which penalties were much increased by an Act passed in 1562 for the maintenance of the navy. And in a pamphlet written by John Erswicke, in 1593, "the benefits that grow to this realm by the observance of fish-days" were duly set forth. The author states that the non-observance of the fast-day regulations has injured the fish trade very much, and also—the main point—that her Majesty's navy is suffering greatly from the want of a growing body of fishermen to supply sailors. In Scotland an Act was passed in 1594 extending the period of Lent, and enacting that during it

no meat should be eaten on the Wednesdays, Fridays, and Saturdays. A commentator on Scottish history remarks that the Act in question evidently embodied a political move in favour of the Scottish fisheries, although it was made to appear as passed on behalf of the Church. Some of the ingenious plans devised for the popularising of fish food in more recent times—a hundred and fifty years ago—seem amusing to us in these days of fast trains. One Houghton, for instance, proposed a scheme of fleet horse-expresses to carry fish with "commanding rapidity" to places within twenty miles of London, and to return with equal speed with supplies of fresh eggs and other country produce. At an earlier period, relays of men used to carry fish to the suburbs with tolerable celerity during Lent, when all kinds of sea-produce were in great demand. Light carts were, however, speedily adopted to carry the produce of the sea to the surrounding towns; and in time spring vans were built to bring the fish from the coast to London. Such modes of carriage would be of little avail in the present day, when over 130,000 tons of fish every year reach the metropolis by railways and steamboats, which, for a population of 4,000,000 persons, is at the rate of about 72 lb. for each person per annum. Notwithstanding the cry of "over-fishing" and scanty supplies, it is found at each recurring period of Lent that a heavier weight of fish than any previously known has passed through the hands of the fishmongers. While it may be observed that during March and April there are always over twenty different sorts of fish in excellent condition for eating.—*St. James's Gazette.*

SPAWNING TIME OF DACE.

DR. BRUNTON is quite right; there can be no doubt but that dace are very early this year. February and March may have been the months in which they spawned in years ago, but certainly March, April, and May have been the favoured periods during the last decade or so. I have a theory that the average temperature of seasons—say, ten in number—so far influences the domestic interests of fishes as to alter traditional records of spawning almost entirely in some cases. Dr. Brunton as a scientific man will see what I mean at once. Suppose, for example, a dace has hitherto spawned in the beginning of March, owing to its ancestors and itself having been subjected to warm winters on the average. Owing to some solar or planetary influence the temperature of the succeeding six or seven seasons is lower (we will suppose). Is it not likely, reasoning from analogy and fact, that the spawning of such fish will be delayed at the end of the term mentioned to a later time in the year? Carp in warm quarters will breed twice a year; this I have proved; and only once in a cold residence—sometimes not even once, if the water be intensely chilly. The spawning times of fishes cannot be regulated even by Act of Parliament!

FISH IN THE THAMES.

There can be no doubt that Mr. James' complaint about perch and jack fishing in the Thames is one based on real grounds. Jack and perch are by no means so numerous as they were within my recollection, say of twenty years, but this must be attributed to the greatly increased number of anglers. For one angler twenty years ago there are ten now, and these are, in the majority of cases, of a widely different class to their predecessors. The latter were usually fishers for sport only, and, as the experience of every old Thames fisherman will bear out, were rather disposed to return undersized fish than the present race of anglers, who, if not hunters for the "pot," are certainly seekers for the premier glories of weighing-in at their respective clubs. This incentive to make weight, is, I am firmly persuaded one of the chief causes of river deterioration, and jack and perch,

being possibly the earliest fish to capture, consequently suffer first.

So far as I am concerned personally, I should be glad to see jack exterminated from the Thames, and the Thames trout reigning in its stead. A close time for trout for five or seven years, with active breeding operations such as those of Mr. Forbes, at Chertsey, at intervals of every few miles on the upper Thames, and an open season all through the year for pike, would effect this consummation so devoutly to be wished, and I am prophetically sure that the supply of fish would not for a century decrease thereafter.

Swans, floods, steam launches, and the increased traffic, must, in the nature of things, possess sound deteriorating influence—to what extent is but a matter of personal opinion. I am inclined to believe it a very great one.

By the bye, one large town, Richmond, discharges no end of sewage still into the river. Can anybody tell me how the law stands in respect of this disregard of the Act passed in 1876 (I think)?

(To be continued.)

FISH AND FISHING IN RUSSIA.

(From our Correspondent in St. Petersburg.)

IF there is a country where angling stands not far from its primitive state, to be sure it is Russia. Rod—a hazel, birch, or juniper stick; line—twisted and knotted horsehair; float—a piece of bark roughly cut into a longish barrel; hook to match.

In the last ten or fifteen years, angling has made great progress, now it is not so rare to see an angler using an English or French rod and a winch; but the majority (and a very powerful one) still cling to the hazel stick and knotted horsehair line, finding them to be the weapons which a thorough sportsman must use (no pun intended); and those even who have overcome their prejudices against “civilised” fishing tackle, have still a propensity for coarse tackle. For instance, it is by no means impossible to see an angler fishing for bream with a four-joint trolling rod, salmon reel, reel line (No. 20), and a line of salmon gut. The idea is, coarse tackle is more reliable than fine. The hooks most in favour with Russian anglers are flatted Kirby bent, with long as well as short shanks (stout wire is a desideratum). It is thought to be a *conditio sine qua non* for a good hook to be flatted, to have a roundish bent and the point turned sideways. In fact, the majority of Russian anglers would not look at a Limerick (the hollow-pointed except, which have come in usage, though restricted, of late years) or sneck bent, otherwise than with a sneer. Small hooks also are not the favourites with my countrymen; the smallest hook used for such fishing is No. 9, the finest line for the same purpose being *only* four twisted horsehairs. Having given to the kind (and, most probably, astonished) reader a slight idea of our fishing tackle, I shall give a brief account of the sporting fish met with in Russia, which are also indigenous to England.

The salmon (*Salmo salar*), Lósos Isrömya, is to be found in all rivers flowing into the White and Baltic Seas; weighs up to 60 lb. Angling for salmon is never practised, and would be deemed sheer madness, except by a very small minority of anglers; so small, indeed, as not to be worth speaking of.

The sea-trout or salmon-trout (*Salmo trutta*), Taimen, inhabits the rivers and lakes belonging to the White and Baltic Seas; weighs up to 30 lb. Is sometimes fished for with a line, the hook being baited with a lob-worm or small fish. A more usual way of catching this fine fish, is to drag a rudely made spinning bait behind a boat rowed along at a moderate rate. The bait is a

long narrow piece of tin or brass plate, armed with a single hook. The head of the bait has a particular bending, which causes it to spin; the hook is firmly soldered to the brass and has the shank trimmed with a strip of scarlet cloth.

The trout (*Salmo fario*), Forél, Pestrúshka, from “pestrü”-speckled, inhabits the rivers running into the White and Baltic Seas, as well as many of those running into the Caspian and Black Seas; weighs up to 10 and 12 lb. It is usually fished for with a float, worms or small live baits being used. Fly-fishing is practised only in the neighbourhood of Petersburg, the majority of fly-fishers being Englishmen, though there are also a few Russian anglers very proficient in this branch of the sport.

The grayling (*Thymallus vulgaris*), Chárius, Kutemá, is scarcer than the trout; it is not to be found in many rivers where trout are plentiful; weight up to 3 lb. It is also seldom fished for with the fly. In the swiftly running rivers of the Ural Mountains they catch grayling without any bait by means of a leaded hook somewhat like a single leaded trolling hook. This lure has a very rude resemblance with a fish.

The perch (*Perca fluviatilis*), Okun, is to be found over all Russia—in lakes, rivers, and even ponds. It reaches sometimes the enormous weight of 12-15 lb. (Russian). The larger are fished for with a gudgeon or bleak—the smaller ones with worms. Scoured worms are not the custom in Russia; spinning is not practised.

The ruff or pope (*Acerina cernua*), Yorsh, is a favourite with many Russian anglers; the only bait used for it is a small worm. It reaches (though seldom) the weight of 1 lb.

The pike (*Esox lucius*), Shtcháka, inhabits the rivers and lakes of all Russia; weighs up to 100 lb. Is exclusively fished for with the live bait; is often (even for the most part) caught on trimmers and night lines. In spring, small jack will sometimes take a worm, and, of course, nearly always cut through the gut or horsehair.

The carp (*Cyprinus carpio*), Carpia Isazán, is to be met with in all rivers, excepting those running into the Baltic and White Seas; weighs up to 40 lb. Is fished for with extra coarse tackle, the hook being baited with a worm.

The tench (*Tinca vulgaris*), Lin, is common to all rivers, lakes, and ponds of European Russia; weighs up to 15 lb. Is not always to be enticed to take a bait. Favourite bait—brandling or red worm for the small and middle sized ones, lob-worm for the large ones.

The carp-bream (*Abramis brama*), Leshtch, inhabits the rivers and lakes of all Russia; weighs up to 25 lb. Bait—worms, rye-bread, peas.

The silver bream (*Abramis blicca*), Gústera; weighs up to 3 lb. Baits—the same as for the carp-bream.

The chub (*Squalius cephalus*), Golóvl is to be found everywhere; weighs up to 15 lb. Baits—cockchafers, butterflies, grubs, worms, crawfish, frogs, bleaks, gudgeon, &c., rye-bread.

The dace (*Squalius leuciscus*), Yelétz, common to all Russia; weighs up to 1 lb., though seldom. Baits—flies, beetles, and worms.

(To be continued.)

A NEW ANGLING SOCIETY.

OUR readers will be glad to learn that a new high class angling society is in course of formation, designed specially to meet the requirements of City and mercantile men, its present head-quarters being at Mr. Thompson's, The City Larder, 19, Throgmorton Street, E.C. An influential committee has been secured, and a large number of members already enrolled. It is but needful to add that the society not only

proposes to rent and stockwater, but to discourage the taking of small fish, and to disseminate useful information, to secure the good wishes of all anglers for its permanent success.

In connection with the above, the following circular has been issued:—

“A number of gentlemen anglers propose to form a first-class society, designed to meet the requirements of those to whom existing angling clubs are not conveniently adapted.

“The advantages of joining an association of this kind are obvious: information is disseminated by congenial social intercourse, and the best interests of the angler largely promoted. Members are also enabled to travel at greatly reduced rates to the principal fishing stations, and it is hoped in time that the new society may be able to rent water, and offer privileges not conferred by membership of other societies. It is intended to make the subscription as light as consistent with the objects in view, and that all members should be proposed, seconded, and ballotted for previous to election.

“An influential Committee has provisionally been formed, and a considerable number of members obtained. Gentlemen desirous of joining may leave their names with Mr. Thompson, The City Larder, 19, Throgmorton Street, Bank, E.C., where a meeting will be held on Friday, March 25th. Chair to be taken at 6.30 p.m. precisely. The attendance of gentlemen interested in angling is cordially invited, and any suggestions will be welcomed in the interval.

“On behalf of the Committee,

“March 17th, 1881.” “G. AUSTIN, Secretary, *pro tem.*”

ANOTHER NEW CLUB.

SIR,—I beg to inform you that we are about starting a new angling club, under the name of the St. John's Wood Piscatorials, and am very pleased to say that we have over thirty gentlemen waiting to join, and I feel sure we shall have a very successful club. If you will kindly give this publication in the next issue of your valuable paper you will greatly oblige.—I am, &c.,

W. F. FIELD.

69, High Street, St. John's Wood, March 22.

P.S.—The club will have a room at the Queen's Arms, Lower William Street, St. John's Wood.

HOW TO PUT LIVE BAIT ON THE HOOK.

THINKING many of your readers would like to know the best way to put live bait on the hook, I, speaking from experience, say take a piece of black cotton thread about a foot long, tie the middle of it tight under the barb of the hook; now take the bait in the left hand, lay the hook on its side, the barb up by the shoulder of the bait, with the shaft along the belly; now pass the thread over the shoulder and around under the fish, and tie the shaft of the hook, then pass the thread along the shaft until under and back of the back fin, then tie tightly around the shaft of the hook, then pass the thread on each side of the fish up to the back, just back of the back fin, and tie with a bow knot. This fastens the bait securely without hurting it, and you will have the liveliest and best bait ever used. As the shaft of the hook lies along the belly, it keeps the bait in proper shape, and as the fish usually takes live bait head first, you are sure to hook your fish. With just a little patience at the first trial, you will find you can tie on the bait very quickly, and then have the best bait you ever used. I learned this from a gentleman who was the most successful fisherman I ever met:

G. F. W., in the *Chicago Field*.

FRANK BUCKLAND'S BOOTS.

THE late Mr. Frank Buckland had a great objection to stockings and boots and coats, his favourite attire consisting of nothing else than trousers and a flannel shirt. Boots were his special aversion, and he never lost an opportunity of kicking them

off. On one occasion, we are told, travelling alone in a railway carriage, he fell asleep with his feet resting on the window-sill. As usual, he kicked off his boots, and they fell outside the carriage on to the line. When he reached his destination, the boots could not, of course, be found, and he had to go without them to his hotel. The next morning a plate-layer, examining the permanent way, came upon the boots, and reported to the traffic manager that he had found a pair of gentleman's boots, but that he could not find the gentleman. Some one connected with the railway recollected that Mr. Buckland had been seen in the neighbourhood, and knowing his eccentricities, inferred that the boots must belong to him. They were accordingly sent to the Home Office, and were at once claimed.

THE APPLICATION OF ELECTRICITY TO WHALING.

SOME recent attempts to capture whales by stunning them with electric shocks are worth recording here. The first trial was made last December by a Bremen vessel, the steamship, *Alexander*, when cruising off the Swedish coast, between Stromstad and Fjellbacka. On this occasion the harpoon was put in communication with the battery on board by means of an insulated wire; the electric circuit, however, only being completed at will of the operator when sufficient penetration had been given to the harpoon. The result was not entirely successful. The wire snapped, its tensile strength having been over-estimated, and the harpoon also proved of insufficient weight. However, the second trial, made by the steam launch, *Victor*, when the same method and battery were employed as before, resulted in the killing of the first whale by electricity. Struck in the side by the harpoon, followed up by the powerful electric shock, the whale remained absolutely motionless, and appeared to die instantaneously. Unfortunately the carcass was not recovered, as owing to the steamer proceeding at too great a pace, and the line breaking for want of being payed out with sufficient rapidity, it sank to the bottom, with harpoon and 400 feet of line attached.

NOTICE OF TACKLE.

SPRING FLIES FOR THE DEVON AND SOMERSET RIVERS.

MR. WM. MUDFORD, of Fore Street, Tiverton, the well known tackle-maker, sends some samples of his early flies—his “principal flies” he calls them. The flies sent are the iron blue, hare's flax upright, heron's body blue, half stone, silver twist, red upright, aller bud, rough gold twist, March brown and blue upright. Mr. Mudford knows exactly what is wanted, and is himself a skilful salmon and trout angler. We can recommend his flies with confidence, and have for years past always found them good killers on the Barle, Exe, &c. Our favourites out of the above are blue upright, half stone, rough gold twist, and red upright.

ANGLERS should always be provided with something to take away the swelling and poisonous effect of the bites of insects. They should also have with them something to apply to a cut or sprain. Pond's Extract reduces the swelling and inflammation, stops bleeding and pain, and hastens the healing process in case of any wound or sprain; and it has no equal for application to the bites and stings of insects. Therefore never go on a fishing excursion unprovided with a bottle of Pond's Extract. It is for sale at all chemists, at 2s. 3d., 4s. 6d., and 8s. 6d. per bottle.—[ADVERTISEMENT.]

TIED HANDS AND ARMS.—Edson's Electric Armlets and Wrist Bands. Invaluable for anglers and gun sportsmen and highly recommended for all persons having tiresome writing, sewing, or music practice. They give wonderful energy and strength, enabling the wearer to accomplish tedious work with steadiness and comfort. Price 2s. 6d. per pair, silk web and fine steel clasps. Sent to any address on receipt of P.O.O. payable to J. Edson, the Electric Fabric Co. Patentees, No. 1, Charlotte Street, Bedford Square, London W.C.—[ADVT.]

MRs. F. Y. BROCAS, Artificial Fly Dresser, 4, Mill-street, Conduit-street, Hanover-square, London, W. A stock of best flies always on hand. Flies made to pattern. Lessons in fly making given.—[ADVT.]

RIVER REPORTS

MID-THAMES.

"Like to the time o' th' year between the extremes
Of hot and cold; he was nor sad nor merry."—SHAKESPEARE.

Between the extremes of hot and cold, or rather perhaps between cold and hot, Thames anglers can hardly be sad, or really merry—not merry, because the past season has been so brimful of floods and disappointments—not sad, because the trout work is close at hand. The sun is beginning to shine on both sides of the hedges, the river is in prime colour and order, and good reports are in the ascendant, like the fish, from most of the good waters in Mid-Thames. Notably those of Pangbourne, Streatley, Marsh Pool, New Lock, Temple, Marlow, Odney, Boulter's (Maidenhead), Bray, and Boveney. My advice to Thames trout-men is to try their luck under the favourable condition of the stream as it is at present, before the "madding crowd," pleasure and youth—one at the helm and the other in the prow—scare the spotted leopards into inaccessible and unfishable haunts.

THURSDAY EVENING.—River in prime condition for trout work, and as I shall not have another opportunity of putting my brother piscators "fly" before the commencement of the trout season (Friday, April 1st), I would strongly advise them to be at work on the first day at 6 p.m., and toil and spin in every available cull and boil until 6 p.m., and that great may be their reward is the prayer of

MARLOW BUZZ.

Thames (Richmond).

There was an error in last week's report. It should have read "it will be a good opportunity now for members of angling clubs who visit Richmond," not as was printed "to visit Richmond." To correct this will oblige. Not letting the past season pass without a word. It has been a very trying one, both to anglers and fishermen. In the first part of the season there was the heavy rain, and as soon as winter set in there was the snow and ice during the nine months, there was quite half the time the river was not fishable, or not what it should be for sport, but after putting it altogether, the good with the bad, it was about the average. Here, perhaps, it is because it is near London, the last season was one of the best that I ever knew for dace-fishing. Not only the quantity, but the size they run. I remember one night coming ashore after a day's fishing; there were four of us came in at the same time, and between the four punts there was 132 lb. pounds weight of dace. This was about the best let I ever saw. Besides the dace-fishing we got our share of barbel, and it has been above the average for bream during the last part of the season. If it had not been for the bream we should not have had much to fish for. Roach-fishing of the past season was not up to the average of other seasons, the roach running so small to what they do as a rule. So here the angler that goes in search of the spotted beauties will do well in giving Teddington Lock a turn during the fore-part of the season. There are a few good fish about this season, and they are sure to find their way to the Locks, as the water gets lower. There is more fish stopped this side of the Lock this season to spawn than I have noticed before, as there are hundreds of them on the shallows now, and they look quite clean yet.—JOHN BUSHNELL, Fisherman.

P.S.—Any gentleman wanting a good punt can buy the one I fished in during the season. She is not only a good punt, but the one I won the Open Punting Race in, being one of the fastest punts there is of her kind.

Thames (Twickenham).

My last week's report having miscarried, I am pleased to say we closed the season much better than I expected. During the last six days I had thirty punts out in all, but I am sorry to say we had no large takes of fish, the average being about six dozen fish to each punt, but when we see our Richmond and Teddington fishermen honour us with their company, we may take it for granted it is bad all round. Good news for Thames anglers. Last Friday I assisted in netting from the lake in Kew Gardens, and saw placed into the river Thames nearly a ton of mixed fish, amongst them being nearly 200 jack, one monster weighing about 22 lb., and another about 16 lb. The arrangements were carried out by Messrs. Spreckley and Brougham, and several members of the T.A.P.S., assisted by Mr. Walters, the head river-keeper, and other river-keepers.—ALFRED PERRIN.

Thames (Windsor).

We must not be surprised at anything in the way of weather after the eccentricities of the last few days, just as one was beginning to know something in the trout line, our old friend returns—trout turn tail and go down, disgusted with things above-surface. Worse weather than this, and many Thames trout have been made fools of on the 1st of April, and in water high and thick. As regards its present state, the colour is good; and, though not seen playing, the whereabouts is quite sufficient for a good Thames trout fisherman, if anything, rather to be preferred. I hear the "eighty-one tunner," as your contemporary *Bell's Life* calls it, has been showing himself at the Ferry rails, Eton side. When last I saw him, he looked all 12 lb., and more, but has been severely pricked, though he has had time to forget it. From other quarters, I hear of trout, but with this cold wind one's chances of seeing them would be poor; so I shall wait for a more genial time. Those who intend trying them should not be sparing of bait if water comes a little thick, as a good bright bait is everything then. The Windsor and Eton Angling Preservation Society netted some of the ditches in the neighbourhood on the 18th inst., but the result, compared with last year, is very poor, being less than half. This year, it is only 27 jack, 410 roach, 1 chub, 68 perch—total, 506; against 72 jack, 93 perch, 942 roach, 49 chub, 1 tench, 1 carp, taken 24th March last year. Difficulty in netting some of the best places, owing to obstructions, will in a great measure account for this; but, as regards this netting, a deal of trouble and expense might be

saved if, some considerable time before the fence months began, gratings, same size apart in the iron bars as that used at the waterworks, placed at each end of these ditches would prevent these jack and perch working up. The flow would not be interfered with if each bailiff looking after them, when a push of water is on, was provided with a similar hitcher to that used at the waterworks for clearing away weeds, debris, &c. This would save a lot of walking about looking after labourers and "bricks," who, in spite of all law, will, if there is half a chance, use the fatal noose. In last week's *Licensed Victuallers' Gazette*, I notice a perch is reported as being taken in the Thames, at Windsor, of over 4 lb. I have been inquiring in all directions, but nobody knows anything about it. As it is an extraordinary weight for the Thames, the name and address of the captor not being mentioned, I, as well as several other anglers in the neighbourhood, would like to hear if it is correct. Perhaps some of your readers will be able to give the information, as no Windsor person to my knowledge has taken such a splendid specimen of *Perca-fluviatilis*.—B. R. BAMBRIDGE.

Avon (Binton).

The water by this time is in very good condition, but on Monday last was still thick, owing to the heavy rains the week before. The weather here is quite like summer, but of course fishing is out of the question, as we are into the close season. It seems a shame, though, especially after experiencing such weather all through the winter. T. Atkinson, Esq., was fortunate enough to land a brace of jack in prime condition 4 lb. and 5 lb. respectively. There were also some very good baskets of roach and a few dace caught with the fly on the shallows. The dace were full of spawn, but the pike are still in good condition. —A. WELESLEY WARNER.

Barle and Exe (Dulverton).

These rivers are now in first-rate order for angling. To-day they were coloured, owing to heavy rain on Exmoor; but, at the time of writing, are fining down nicely. In fact, it was good minnow water this morning; and this evening good for fly-fishing. The wind has been very high the last few days, and very cold. Should it become warmer, sport during the next few days ought to be very good. In spite of the cold wind, however, some fair baskets have been taken, from 1 doz. to 3 or 4 doz. each basket—chiefly taken with the blue upright, silver twist, March brown, and blue dun.—W.

Dove (Derbyshire).

We have had something of the lamb about this month, but much more of the lion. This week has fairly brought home Tennyson's idea of "the roaring moon of daffodil and crocus." The wind has blown so gustily that trout fishing has by no means been a perfectly happy recreation. Then, too, the wind has not alone been obstructive. We have had daily showers of snow, sleet, hail, rain, drizzle, and all the rest of the unrequited elements. However, this is the period of the year when anglers will go out; the trout are ready to be killed, and who can resist the temptation to face rude Boreas, Jupiter Pluvius, or any other of the fabulous deities who preside over the "heavens above," if not of the "waters beneath." The result is that we have had a fair number of rodsters out on "ye gentle Dove." If, however, a few rodsters have been out, not so the flies; they have been nearly all in, and they seem determined to stop in till the weather mends. Sport, as may be gathered, therefore, has not been brilliant enough to set the *blasé* piscator's mouth watering. A few nice dishes have fallen to the blue and yellow spring duns, but the best fish have been killed by Mr. Gregory's Windsor bee, a capital lure for brooks and tails of rivers, as well as for the main streams themselves. About a couple of brace would be the average with the flies above-named, while there was one basket of 4½ brace with the bee from Bentley brook.—THE SPODGER.

Exe (Exeter).

We have had some splendid weather during the past week, and the river has returned back to its usual spring level, consequently both salmon and trout have to be reported, but not to any great extent. Mr. G. Lee, of the Elephant and Castle Inn of this city, has commenced, with his usual good luck, by securing four fine salmon, their respective weights being two 8½ lb. each, one 9 lb. 14 oz., one 13½ lb. This gentleman proved one of the most successful rodsters both last season and the season before, securing also some heavy creels of trout. Several trout have been taken at Salmon Pool, four of which coming to Mr. Blake of the Museum Hotel. The net fishermen will soon commence in the lower waters and estuary, and everything up to the present is well in their favour. It is a most remarkable occurrence for this part of the coast at this late season, but the herrings returned here during the past week, and hundreds of thousands were taken and forwarded to most of the principal fish markets, some being sent, I am told, even to Yarmouth, where they appear to have been very short of them. I have seen an enormous quantity of them, all bearing the same appearance—viz., being over full and ripe with milt and ova. It exuded from both sexes without handling, the ova being of fine size, and every one separate. Whether it was the warm weather brought them in or not is a query, but they are all gone now, and the weather is very cold, with sundry hailstorms during the day, with a north-easterly wind. Several disciples of old Isaac were out to-day. I hope to report something worth reporting in my next. I have a letter from a friend fishing the canal near Tiverton, who reports six jack on one occasion and seven on another. The largest, however, did not exceed 7 lb. to 8 lb., but in the five times' fishing my friend and another have taken nineteen fish. These, of course, were taken previous to the close of the season. I say "Well done, friend E. B. You render a service by so doing." When the season opens again we hope to see him with us in Exeter. I hear Mr. Pearson had one of 12 lb.—FRANK GOSDEN.

P.S.—Mr. C. Blake this afternoon four trout, and Mr. G. Lee has just returned, having run one fine fish of about 18 lb., but, not being securely hooked, lost. Amount of trout, nineteen for the season up to now.—F. G.

Ilfracombe.

To-day the weather has changed for the better, and I saw a few gentlemen fishing with rod and line from the piers. There has also been a few boats out this morning hooking, they have all got fish; catches small, varying from 6 lb. to 20 lb. Catches with rod and line vary from 3 lb. to 10 lb.; time, about two hours per tide. There has nothing come under my notice this spring in fresh-water fishing worth reporting; though I am told by old hands that trout are very plentiful about the neighbourhood of Ilfracombe and all are waiting for fine weather, when they expect to make some good baskets.—HENRY COMER.

Lea (Cook's Ferry).

The season has closed, and all round it is about the same report—cold weather, floods, and bad fishing—and those who have come here are in one mind that takes are small. On Sunday Mr. George Stevens, bailiff, Mr. Collyer, Mr. Monro, and others were walking from Cook's Ferry to Lea

Bridge during the whole day; and I am sure the waters will be carefully watched during the fence season, so when the open season comes round we can look for sport.—S. SEWELL.

Lee (Co. Cork).

The want of sport which characterised angling in the Blackwater since the opening of the river on the 1st of February, has been compensated for during the past week the river extending from Mallow downwards appears now to be well stocked with fish, the late heavy floods having conduced to that result. During the week several springers were landed including the following:—Colonel Grimes hooked a new springer 28½ lb.; Mr. H. Smith, Millvale, three weighing 7, 11, and 11½ lb. each; Mr. Fleming, Ballyhooley, one, 26½ lb.; Captain Morgan, Bidetown, one, 22 lb.; Mr. J. Turner, Mallow, one, 16 lb., and another 16½ lb., net. On the Lee the sport was not as good as it was on the previous week. The intense cold which set in on Sunday with sleet, thunder, and snow interfered with the prospects, and not alone scared the fish from rising, but scared fishermen from the banks. On Tuesday, a heavy downpour dissipated the severe character of the weather, and a flood yesterday cleared out the snow from the river, and left the water in good order for angling. On Friday and Saturday, before the change, among the successful sportsmen were, Sir Oriel Foster, four; John Manning, four; Mr. George Colthurst and his son, three; Major Nettles, some Mr. R. Bailes, four; Sir Augustus Warren, two; Mr. George Haynes, one; Mr. J. Lambkin, one.—**ANGLER, Cork.**

Plym (Devon).

All rivers in our neighbourhood are in good condition; the late rain has done good, and some good baskets have been taken with the blue dun, march brown and the blue hackle, rats' fur body, red tail. Salmon are going to sea in numbers. Wind, E.; drizzly rain.—**WILLIAM HEARDEN.**

Suir and its Tributaries (Clonmel, Ireland).

The salmon fishing with single rod and line only has been wonderfully good since last I wrote. The members of the Suir Club now staying at the Glengal Arms, Cahir, killing between them in four or five days forty-three salmon, average weight about 15 lb.; and on the previous Thursday landed nine fish, and ten on Friday. Mr. Skipworth, near Golden, killed a fine fish of 25 lb. Mr. and Miss Massy, Suir Castle, have been most successful, and also Colonel Peyton and Mr. W. D'Alton in one week landed eight salmon. Mr. Stewart (20th Hussars), at Molough, killed one of 8 lb., on the "blue doctor," and Mr. Hutchings, at Banard, landed a splendid fish, weighing 28 lb., on the "butcher." Mr. Edward Quinlan, Suir Mount, got one, 12 lb., on the "Ardinnan jockey." Up to the present, Captain Palliser's fish of 30 lb. has been the heaviest. Several others have also been successful, the names being too numerous to mention. There is every prospect of this season proving the best we have had for years. The river was pretty low until to-day quite a heavy flood ran down, which will put a stop to much sport for a few days. There will now be a fresh supply of spring fish again after this flood, and it is owing to the constant floods we have had since the season opened that the upper waters are so well stocked with fish. The cot men have not done very much, but will probably make up for it to-morrow, as the water will be the proper height for them then if we do not have any rain to-night. The trout-fishing is very good. Colonel Mansfield and Mr. Perry, at Grove Stream, caught in two days between them nine dozen and six trout, averaging three to the pound. The killing trout flies are olive duns, gold wrens, silver-black hackles, &c.—**DORA.**

Trent (Nottingham).

I was unable to send you my usual letter last week, owing to illness. I will, however, give you the final notes of the doings of our anglers during the last three days before the close season commenced. The water was in splendid condition for bottom fishing, and the weather all that could be desired; the consequence was, several great takes of roach, bream and chub were made, with worms for bait; but, as several anglers truly observed, the most vexing part of the business was that they should be compelled to discontinue angling when all the three fish named were in the best possible condition. A great number of our rodsters are much annoyed at the close season commencing so early, because they are of opinion it is a mistake, and I think so too; and no doubt the Sheffield anglers are of the same opinion. The latter at one time thought it was going to be a good thing for anglers in general, but now the reverse is the case. The Mundella Act is becoming very annoying to all anglers throughout the country, and I was not surprised at your correspondent in last week's *GAZETTE* terming it "an annoying farce." No doubt things might have been altered had "Shut Out" or several of your correspondents commenced the subject sooner. Mr. James Gregory, of Birmingham, informs us that their members who rent the water at Alrewas are allowed to fish up to the 15th of May, when all the rest of the Trent is closed against rod-fishing. I and many of our anglers do not understand this, and an explanation would be gladly received. Six of the netting fraternity were caught here, and were fined altogether in a sum amounting to £17, besides the loss of all their nets. A close season will never be of any good until netting is stopped.—**W. BAILEY.**

Waveney (Beccles).

At the conclusion of last week and the beginning of this the river had gone down considerably, and was in capital condition for bottom fishing. On Monday afternoon we had a heavy downfall of snow, which materially altered the aspect of affairs. But the wind has now worked round to the west, and the river is getting again in good order, and I think that, provided we get no more downfall, by the time this is in print there will be every probability of capital sport. As the close season does not affect the waters of either Norfolk or Suffolk, anglers can still enjoy plenty of sport here while other waters are closed. On Saturday last several rods were out in the afternoon, and several very fair takes were the result. On Sunday two rodsters took advantage of a favourable day, and succeeded in capturing a painful of good roach, ninety-two fish in all, but as they were not weighed, I cannot give exact weight, although they were estimated at about two stone. Small red worms are the only bait that has proved successful up to the present. Paste no use. Pike have been drawing up the river and into the dykes preparatory to spawning, and a great number have been killed by a set of fellows who are continually on the prowl for anything they can lay their hands on. Only a few days ago I heard that five fine full fish were taken by one of these loafers, besides one that had spawned.—**C. B.**

Wye and Derwent (Derbyshire).

We had a flood on the Derwent last Sunday morning from the heavy rain that fell up in the woodland, which quite put a stop to fly-fishing for a short time. The weather during the week has been all against the angler. We had a great deal of snow fall last Monday, and the wind being so boisterous and bitter cold, has caused very few piscators to turn out on either of the above

rivers, and those few who have been out have done very little. Two-and-a-half brace of trout were killed on the Derwent last Tuesday with the small cockspur worms for baits, and one brace of trout were killed with the "Derby trout-killer"—the fish being nearly a pound apiece, and in good condition. We have a good many anglers down here for fishing, but I am sorry to say their fishing prospects are not very encouraging while this bitter cold, boisterous weather continues. Both rivers will be in good order for fly-fishing by Monday.—**GEORGE JAMES EATON.**

Yare (Norwich).

I am exceedingly pleased to have again to report some splendid catches during the past week. From all parts glowing accounts of a rare day's sport come to hand, and anglers have been particularly favoured in and about the neighbourhood of Norwich. Mr. Howard, at Surlingham, this week took seventeen fine roach, averaging 1 lb. each, and Mr. Hinsbey, on Thursday last, close by the same spot, bagged a stone of roach and perch, and showed the same evening several of the fish weighing upwards of 1 lb. each. To-day is a real angling day, and I counted no fewer than fifteen boats, all "high busy," at Thorpe, each man assuring me he was quite satisfied with his day's sport. I saw one roach landed which must have scaled at least 1½ lb., and bream flats were being taken very rapidly. I should like just to mention, for the guidance of our friends at a distance, and to those who anticipate a run down, now that the close season has commenced, the names of the various hostleries at which every accommodation may be obtained, as well as good fishing in their districts. First from Norwich is the Thorpe Old Gardens, lying quite by the side of the river, and attainable from the city either by bus or rail. This, as well as an angler's resort, is the head-quarters of all the principal rowing clubs in the city. Mr. John Hart is the proprietor. Next to this is the Woods End, Bramerton, about a mile and a-half further on the stream. This is a most picturesque part, and good angling always to be had. Next in order is the Surlingham Ferry, which must be reached either by the river or road, as it is some distance from a station. Between this and the next fishing station, which is Coldham Hall, is the great place for roach-fishing during the summer months, and any stranger who inquires for Birch Dyke (which is an outlet from Surlingham Broad) will be sure to be rewarded for his trouble. Coldham Hall is reached from the Brundall station, and a pleasant walk it is from the station to the house, across the marshes, in fine weather. Here is one of the largest fleets of boats kept on the river, and certainly the most useful to anglers. Leaving this we come to Buckenham Ferry, another much frequented spot. Close by the house may be found 15 or 16 feet of water, and some handsome fish have been taken here. Cantley Red House is the next, noted years since for the splendid bream which were to be got close by it, but since so many fish were destroyed by netters very seldom anything of any account is taken. Reedham Ferry, more frequented by our Yarmouth friends, is about the last place of interest, and it was here that several "great takes" of bream were reported last season. Next week I will give the houses on the Bure.—**ANGLER.**

[Will "Angler" in future be good enough to write on all cuttings the name of the paper they are from?—**ED.**]

SALMON FISHING IN THE LIFFEY.

(FROM OUR DUBLIN CORRESPONDENT.)

THE Chairman of the Grand Canal Company (Mr. La Touche) stated at the half-yearly meeting of that body last month that ice seventy inches thick had been found in the still water of the canal, a short distance from this city. The fall of snow, too, during the last season was almost unexampled, to the great loss of the great numbers whose occupations are out of doors. There are few rivers so materially affected by such a state of things as the Liffey. One-third of its course among the Wicklow Mountains is in a table land so high that even when passing the village of Blessington it is at a height of 800 feet above sea level. From thence the youthful river tumbles down to the plains of Kildare by a series of falls, or rapids (Lynnes they are called in the vernacular), with something like a fierce impetuosity. That it is so is a fortunate circumstance for the health of this city, for as the civic authorities treat the river as their main sewer, it is desirable it should be flushed, as these freshets flush it, thus rendering the bad somewhat less bad. A sluggish current, the colour of tar, and the consistency of pea-soup, the organ of smell assaulted by a compound of villanous odours, for which science has no name, are bad enough, but the quays are the healthiest parts of the city. It is with the salmon, however, who have to find their way through this filthy fluid, that these remarks are directed. There is no doubt the flushing from above, and the tide from below, assist the salmon in their upward journey, and the short distance of about a mile between clear salt and clear fresh water is as nothing to the fastest fish that swims. It should be borne in mind, too, that there are excellent salmon rivers where a similar, or worse, gauntlet must be run between sea and stream. The Tyne, for instance, passes for seven miles through the great seat of the chemical-manufacturing city of Newcastle and the vicinity, and, under a special Fishery Act, its salmon-fishing was become an important trade. The commissioners, under the Act, have secured a salt-water pond, which they have named the "Salmon Playground," and in this, at all seasons, fishing is prohibited. They have also opened free passes through all weirs, and they carefully protect the breeding fish. The result was marvellous. In four years salmon have been quadrupled. There can be no reason why Dublin should not try to do what Newcastle has done so well. Salmon-fishing in the season of 1881 has been surrounded with many difficulties. Above tide few spring fish have appeared at all, and fewer still have been captured by rod and line. They seem indisposed to rise to fly or bait, and even the oldest hands have little to boast of. The river, too, is in an unsatisfactory condition for the fly and bait—the best is the pea or roe of the fish itself—have scarcely been tried. A great cause of this lack of fish in the river is indicated above. It is well known that salmon will not leave their salt-water quarters until the temperature of the fresh rises to at least the level of the salt water, and till quite recently the stream of the Liffey was in great part melted snow and ice. Netting in the tidal part of the river is but little better off. Spring-fish are taken daily and nightly, but in very small numbers. No skull of salmon has made its appearance in Dublin Bay this season.

GREGORY'S SPINNING BAITS.—"The Gregory," the "Flexible Cleopatra," the "Oxford," and the "Colorado," pronounced by all Anglers and the Press the best baits invented for salmon, trout, pike, and perch. To be obtained from all respectable fishing-tackle shops in the world, and wholesale from Messrs. S. Alcock and Co., Standard Works, Redditch. Flattering testimonials speaking of the efficiency of the baits have been received from the Right Hon. John Bright, M.P.; Mr. William Bailey, Nottingham; the Rev. E. C. Holt, Teddington; Sir William Calder, Kingston-on-Thames, &c. Gregory's registered Archimedean spinning tackle for pike and trout, now ready, is pronounced by the press the best ever invented. For use with dead bait. The tackle is complete in every respect, and can be adjusted to suit bait of any size. Has been tried with remarkable success.—See that the name "Gregory" is impressed on the Archimedean fins, as inferior imitations are offered for sale, and people are thereby disappointed and deceived. Address, James Gregory, Vyse-street, Birmingham.—[ADVT.]

NOTES AND QUERIES.

DUSKY PERCH.

<i>Serranus gigas</i>	Cuvier.
" "	Yarrell, British Fishes, vol. i., p. 6, 14.
" "	Gunther, Cat. British Museum, vol. i., p. 132.
<i>Holocentus meron</i>	Lacepede.
" "	Risso.
<i>Perca robusta</i>	Loudon's Mag. Natural History, vol. v. p. 21.
" <i>gigas</i>	Jenyns' Manual, p. 333.

JONATHAN COUCH, in his History of British Fishes, vol. i., p. 198, states that this fish is not uncommon in the Mediterranean. Risso tells us that it only comes to the neighbourhood of Nice in the summer and autumn, and it appears that the south part of the coast of Cornwall is the north boundary of its wanderings, as it is of several other fishes of the west portion of the Mediterranean, but even there it is found but rarely, and no more than three or four samples have fallen within reach of naturalists. The first of these was taken near Polpero, with a line. Couch also states, I learn from W. P. Cocks, that two others have been brought into Falmouth, and one of these was presented by him to the collection of the British Museum, one, if not more, have been obtained at Penzance, but of its habits on our coast we have none to report.

The manner in which I became possessed of the "*Serranus gigas*" was passing one morning early through the west, or fish quarter, of this city (Exeter) I observed some maunds of hake and other fish exposed for sale, upon one of which maunds a fish caught my attention as being of an unusual character; without making any comment, I asked the price and became the possessor. This fish was taken with the hake off Cornwall, apparently without any particular notice having been taken of it up to this time, although it was the top fish in the basket, from which I got it. I must not omit to state that it was not over fresh, consequently it could not be preserved, although the head was kept in salt for inspection for some considerable time. I communicated with Mr. Frank Buckland, Her Majesty's Inspector of Salmon Fisheries for England and Wales, who very kindly answered me on the 19th of September, 1872, thus:—

"Many thanks for your note about the '*Serranus gigas*.' I have written an account for *Land and Water* this week. If you have got the head of the '*Serranus*' please hang it up to dry.—Yours, &c., FRANK BUCKLAND."

The extract from *Land and Water* reads as follows:—"Mr. F. Gosden, fishmonger, Exeter, has been good enough to let me know that he received on Saturday last a very curious fish, which he sent to my friend, Mr. D'Urban, Curator of the Albert Memorial Museum, Exeter. Mr. D'Urban has identified it as a dusky perch. Mr. Gosden has salted the fish, so I wrote immediately to ask him to be kind enough to send it to me on my return home from North Wales. I found a letter stating that the fish had become so much decomposed that it was impossible to send it up. This beautiful fish weighed 23 lb., was two feet six inches in length, and two feet in girth. At first sight this fish has more the appearance of belonging to the genus Labrass (the wrasse) than to the family of perches; and, in conformity with this, it is said that in Spain, where it is well known, its name is the same as that of the wrasse, but closer examination corrects this mistake, and shows it to be possessed of the proper characters of the large family of perch-like fishes, to which, therefore, we are left to infer its habits belong. The under jaw of this fish is longest, and both, as well as the palate, are covered with numerous slender uncurved teeth, a bed of them in front of lower jaw; the lips resemble those of a codfish, and it has a large hole under the projection of the nasal bone. These fish must sometimes attain an

enormous size. A figure of the natural size of the head of an example, taken at Penzance, of which the body was unfortunately destroyed, measures one foot four inches from the front of the jaw to the hinder portion of the gill cover, and in depth, immediately in front of the dorsal fin, thirteen inches. I regret very much that I did not obtain this rare and curious fish from Mr. Gosden: It would have made a splendid addition to my 'museum.'"

FRANK GOSDEN, Exeter.

FRANK BUCKLAND MEMORIAL FUND.

WE have great pleasure in publishing the following particulars respecting the proposed memorial to Mr. Frank Buckland. We have no doubt whatever that it will receive the warm and hearty support of all anglers.—ED. F. G.

"A proposal has been made by some of the friends of the late Mr. Frank Buckland to perpetuate, by a substantial testimonial, the recollection of his services to Natural History and Fish-culture, and generally to afford to the public an opportunity of paying a tribute of respect to his memory and appreciation of his life-long work.

"For this purpose a Subscription List has been opened.

"It is intended to expend a portion of the sum subscribed upon a bust of Mr. Buckland, to be placed in the Museum at South Kensington, with the collection he so generously bequeathed to the nation.

"It is further hoped that the amount collected may be sufficient to supplement the income of Mr. Buckland's widow by an annuity of £100.

"Should there be any surplus after the purchase of the bust and annuity, the Committee propose that it should be applied to the promotion of the welfare of the fishermen of this country, which Mr. Frank Buckland had much at heart.

"Subscriptions will be received by Messrs. Cox and Co., Bankers, Craig's Court, Charing Cross, or office of *Land and Water*, 176, Fleet Street, E.C., and at the above address by

TO ANGLERS.—W. J. Cummins, Fishing Tackle Maker, Bishop Auckland, is now prepared to forward to anglers his Illustrated Catalogue, which is not only a Trade List but is interspersed with practical hints, useful directions, and valuable information gathered by the river-side from twenty years' experience. The stock consists of his unrivalled Salmon, Trout, Grayling, and Pike Rods, Lines, Reels, Baskets, Artificial Baits, Fly-books, Landing Nets, Gaffs, and last, but not least, his celebrated Trout Flies, which for killing powers stand unequalled. Every article kept in stock is of the very best description.—[Advrt.]

PORTSMOUTH WALTONIAN ANGLING SOCIETY.

The fifth anniversary dinner of the members of this society, took place on Thursday evening at the Golden Fleece Hotel, Commercial Road, Landport; the ex-Mayor (Alderman Cudlipp) presiding, in the unavoidable absence of the Mayor; and the company included Captain E. R. Hill, Captain Wills, Lieutenant Redward, Messrs. Edgar Goble (Fareham), G. Feltham, J. P. Hyams, P. J. Emanuel, T. Hoole (hon. sec. West Central Association of London and Provincial Angling Societies), E. Brookes, J. T. Dyer, J. H. Bracey (vice-president), J. E. Buck (treasurer), W. R. Tranter (secretary), E. Hollanders, C. Daniels, J. A. Monck, Rutter, Hartly Pate, &c. The Secretary (Mr. W. Tranter) apologised for the unavoidable absence of the president of the society (A. L. Emanuel, Esq.) through domestic affliction; also read letters of apology from His Serene Highness Prince Edward of Saxe-Weimar, the borough members, Sir Drummond Wolff and the Hon. T. C. Bruce, Admiral the Hon. F. A. Foley, Major-General Sir Frederick Fitzwygram, Admiral Hayes, Sir Henry Peek, M.P., A. J. Mundella, Esq., M.P., P. Geen, Esq., Alderman W. D. King, J. P. Knight, Francis Francis, Thomas Spreckley, Esq., Messrs. Purchase and Baker, of Chichester. The decoration of the club-room consisted of a very tasteful arrangement of the rods and creels belonging to the members, and of flags and banners, &c., kindly lent by our brother member, Mr. Groom, of Point. Large globes of fresh-water fish on sideboards, the room being profusely supplied with flowers from Leigh Park. A substantial dinner was served in capital style by Host Easton. After the usual loyal toasts had been honoured, Mr. Bracey gave the "West Central Association of London and Provincial Angling Societies," and Mr. Hoole, its hon. secretary, in response, referred to the importance of the local societies increasing their numbers, for the larger the number of their members, the more concessions they were likely to obtain from railway companies. Since concessions had been granted by the companies to London anglers, no less than seventy-eight new clubs had been formed in the metropolis. To the West Central Association 130 clubs belonged, with 4000 members. (Applause.) Mr. George Feltham proposed the toast of the evening, "Success to the Portsmouth Waltonian Angling Society." In a most humorous speech, he thought such a society had the effect of promoting good fellowship amongst the members, and it had another good result, because to be an angler they must possess many virtues—two of the most prominent being patience and determination to hang on to the end. He was told that two of their members had fallen into streams, and he would suggest they should become members of the swimming club, of which he was president. He congratulated them on the state of their balance-sheet. The society was started but a few years ago with six members, and now they had over 100 with a balance of £30 in hand. He supposed that would be called by the treasurer "net profits." Mr. Triton, the secretary, in responding, said:—Two items of their expenditure had been very heavy this year—viz., the rent paid for trout fishing, and the housing and repairing of the club fishing boats. He felt that the thanks of the members were due to those gentlemen who had given them the privilege of fishing in their waters, and amongst those who had done so much he must mention the names of Sir Frederick Fitzwygram and Mr. Edgar Goble. (Applause.) One pleasing feature in the working of the society had been the production of papers by the members during the winter months, which had been found both amusing and instructive, Mr. J. S. Dyer having contributed three. The members of the Brighton Angling Association had become interested in the matter, for they had written to the president, Mr. A. L. Emanuel, soliciting that gentleman to give their members a paper at his earliest convenience. Mr. J. E. Buck proposed the honorary members. Mr. Daniels gave the health of the chairman, who returned thanks in a most able manner. The secretary announced the list of prizes for the ensuing year, amounting to £50, and including one of £2 2s. from Sir Drummond Wolff, M.P., and others from Alderman Cudlipp and Mr. A. L. Emanuel. Some very fine specimens of fresh-water fish were hung around the room, and it is the intention of the committee to send six of these cases of fish as a "loan exhibit" to the forthcoming Exhibition of the National Fisheries Associations at Norwich, to be opened on the 18th of April.—WM. TRANTER, sec.

March 21.

OTTERS NEAR READING.—A fine male otter (weight 26 lb.) was shot last week on the Loddon, about five miles from Reading, by Mr. W. T. Knapp, of Sulhamstead, Reading.

STOCKING THE THAMES.—By kind permission of the proprietor, some members of the committee of the Reading and District Angling Association on Monday last netted a private lake in Hampshire, and procured five large hampers of splendid fish, which were placed in the Thames the same evening. They consisted of tench from 1 lb. to 4 lb., carp up to 5 lb., and rudd from 1 lb. to 1½ lb. each. All the fish were in beautiful condition, and stood the journey well. The Thames cannot contain too many tench and carp; while the introduction of rudd, for the first time, is of much interest to anglers.

THE CITIZEN states that Mr. James Forbes, of Chertsey Bridge, at his own cost, in connection with the Thames Angling Preservation Society, is engaged in the artificial propagation of fish. The present is the season for hatching the ova; and in the various troughs in his extensive fish-house there are, in the most healthy condition, 3000 real Thames trout, 6000 *salmo fontinalis*, 3000 *salmo ferox*, 1000 *salmo fario*; and of crosses from fish of his own rearing there are 3000 Thames and *salmo fario*, 3000 Thames and *salmo ferox*, 2000 *salmo fontinalis* and *salmo ferox*, and 3000 *salmo fario* and *salmo ferox*. A great number of these have already come into active life, and the others are making rapid progress towards vivification.

CAPTURE OF AN OTTER.—On Monday last William Taylor, gamekeeper to the Marquis of Townshend, caught a very fine otter, and as this makes the ninth of the species captured during his twenty years service on the same estate, it is worthy of record.

ENGLISH fishermen must look to their laurels. Their French rivals have had a big find. We learn by cable that there is now on view at one of the chief Paris fishmonger's shops an enormous carp weighing seventy-eight pounds, which was caught by a net-fisher at Biscarosse. Ten pounds is a big weight for a carp, and this Biscarosse gentleman must have been alive when good Queen Elizabeth "bossed" this pleasant little island.

CAPTURE OF OTTERS.—Two fine otters, weighing together over 36 lb., were recently trapped in Sapey Brook by Mr. Simmonds, gamekeeper to Capt. Boyd, of Sapey Bridge. They had been in the brook for two years, and last season played sad havoc with the fishy inhabitants of it, devouring them to such an extent that the knights of the rod who frequented the water had but poor catches in return for the expenditure of their patience.

YARE PRESERVATION SOCIETY.

The annual meeting of the Yare Preservation and Anglers' Society was held at the Bell Hotel, Norwich, on Tuesday evening, Geoffrey Buxton, Esq., in the chair. There were also present:—The Mayor (S. Grimmer, Esq.), R. Fitch, Esq., J. P., E. Field, Esq., J. P., Messrs. I. O. H. Taylor, J. Allen, R. E. Burroughs, J. B. Pearce, H. W. Stafford, F. A. Steward, S. H. Baldrey, H. Turner, M. J. Bailey, R. E. Thorns, G. Bagshaw, F. St. John, H. Thomson, C. Daniels, E. Coleman, G. Wilson, F. W. Skipper, B. W. Jolly, S. Matthews, T. E. Gunn, A. L. Littleboy, C. J. Greene (secretary), W. Butcher, W. Varvel, S. F. Howitt, F. Moll, — Burrage, J. W. Vince, W. Chettleburgh, W. G. Capon, and others.

The Hon. Secretary reported that the expenditure during the past year had been £126 15s., and that there remained a balance in hand of £47 os. 10d. There had been 46 new members introduced to the society during the year, and to had left, so that the increase was 36. (Applause.)

The President read a letter from Mr. Birkbeck, M.P., expressing his regret that he was unable to be present, and asking the members for their opinion as to the advisability of inviting Mr. Spencer Walpole and Mr. Huxley to the annual dinner.

On the motion of the Mayor, seconded by Mr. Burroughs, it was resolved to invite both gentlemen.

The Hon Secretary reported that a lot of fish, including pike, had been unfairly taken at Wroxham, and he had sent Hewitt, the bailiff, over to endeavour to stop them.

Mr. Field said, knowing the Bure was being watched, a man had got fish from the Yare, and he thought it was not a good plan to take a man off his own river and place him on another. There would be a case for prosecution on Saturday.

The Mayor with much pleasure proposed Mr. Birkbeck, M.P., as president of the Yare Preservation Society for the ensuing year. (Cheers.)

Mr. Field seconded, and said he knew no one who had exerted himself so greatly as Mr. Birkbeck had done for the protection of our fish, and in the cause of our fisheries on the Norfolk and Suffolk coasts than had Mr. Birkbeck—(applause)—whether it were in the House of Commons, in the room of the Secretary of State, or down upon the sea coast. (Hear, hear.) Wherever he was wanted, there they found Mr. Birkbeck, and he knew no one who had worked harder for the public good, for he could have nothing else in his mind. He was not working to make himself popular, but because he felt he was doing his duty, and at the same time bestowing good upon his fellow-creatures. (Applause.)

The President approved all the eulogy bestowed upon Mr. Birkbeck as well-deserved, and the motion was carried with acclamation.

Mr. I. O. Howard Taylor then nominated Mr. C. L. Buxton as vice-president, and said that that gentleman was one of the most active members of the executive committee of the Fisheries Exhibition. He was also likely to be a juror, and had distinguished himself in various ways, and shown that he took the greatest interest in this society. (Applause.)

Mr. Stafford seconded the nomination, which was unanimously agreed to.

On the motion of Mr. Steward, seconded by Mr. Burroughs, Mr. E. Field was re-elected treasurer, and in acknowledging the compliment, he said he should as heretofore do all he could to promote the welfare of the society. He took a great interest in its work, and was never more satisfied than when the Act of 1877 was passed.

Mr. Jolly proposed, and Mr. Baldrey seconded the re-election of Mr. J. C. Chittock as hon. solicitor to the society, and the motion was carried unanimously.

The Hon. Secretary then rose and said that after holding his present office eleven years, he must place his resignation in the hands of the members, and he said he did so for the reason that he felt a great slight had been cast upon the society by the promoters of the Fisheries Exhibition, who did not invite them to send any one to represent them as a society on the committee. He held that the Exhibition sprang from this society, and though there were several of their members upon the committee independently, he thought they ought to have been asked to send someone to represent them officially. He had frequently been asked for information as to what was being done, but could give none, whereas the case would have been quite different had the society been officially represented. He must resign the office he had held so long. (No, no.)

Mr. Baldrey, Mr. Burroughs, Mr. Jolly, Mr. Howard Taylor, Mr. Field, the Mayor, and Mr. Moll all pointed out that no slur whatever had been cast upon Mr. Greene, and that even if there had been any error committed he ought not to punish this society for it. He had been a most valuable and valued secretary, and Mr. Field showed how many of the members of this society were upon the executive committee, while Mr. Taylor pointed out that if this exhibition had been confined to East Anglia the society might well have been officially represented, but as it was a national one it could not well be unless other societies were represented also.

In the end Mr. Greene was, against his will, reappointed secretary, on the motion of Mr. Burroughs, seconded by the Mayor; and after consideration he accepted the position and thanked the members for the confidence maintained in him.

On the motion of the Mayor, seconded by Mr. Pearce, Messrs. Barwell and Stafford were re-elected auditors; last year's committee was reappointed on the motion of Mr. Field, seconded by Mr. Thorns; Mr. Owles was re-elected collector; and Hewitt, the water-bailiff was also re-appointed, with the remark from Mr. Jolly that he had faithfully performed his duties.

After discussion it was resolved to interview the President as to

what date in the Exhibition week the annual dinner should be held on, and Mr. Stafford suggested that the President should not be called upon to go to the great expense of providing champagne; but Mr. Taylor thought that it should be left to the President to do as he pleased, and this met with the approval of the meeting. The dinner committee was thus composed:—Messrs. Stafford, Steward, Pearce, Baldrey, Jelley, Wilson, C. Daniels, F. W. Skipper, R. Moll and the Secretary, and the meeting separated at 11 o'clock.

We understand that all the members of the Champion Angling Club have joined the Y. P. S.

ANNUAL DINNER OF THE LARKHALL ANGLING SOCIETY.

THE seventh anniversary banquet of this largely-increasing club of anglers was celebrated this year under unusually favourable auspices. These occasions always take place at Moulet's Hotel, in Newgate Street, the respected proprietor—Mr. B. Boyce—being a member of the society, and whose excellent catering in public dinners is of wide-spread popularity. It was evident on Tuesday evening last, from the appearance of the banquetting hall, that a much larger attendance of guests was expected, and this was owing to the energy and activity of Mr. G. F. Spencer, the president of the society, whose admirable services the members were determined to recognise in that way. Mr. G. F. Spencer presided on this occasion, supported on his right by Mr. W. H. Brougham, of the Thames Angling Preservation Society, and on the left by Mr. P. Geen, of the West Central Association. The vice-chair was occupied by Mr. F. Boyce. There were present of members and friends: Messrs. F. Croutel, W. Tucker (hon. sec.); B. Boyce, G. Nicholson, C. Davison, J. W. Green, F. Kerry, W. W. Westley, C. J. Morris (treasurer); J. English, Nixon (auditors); Rennett, Caplin, Robinson, A. Burgess, J. Edmondson, W. Spencer, F. Howe, Alfred Glover, H. J. Taylor, T. Sylvester, J. Hallé, George Bruce, G. Moore, P. Fitzgerald, C. Broadlake, W. Webb, &c. &c. Altogether seventy sat down to a splendid and well served-up dinner, which reflected largely on the credit of the establishment, Mr. B. Boyce giving his personal supervision to the arrangements. The menu was most tastefully got up, and in good plain English embraced a service of soup, fish, *entrées*, poultry, joints, pastry, cheese and salad, which were cooked to perfection; and the wines were of the choicest vintages. There was a distribution of highly-perfumed programmes of music, in the way of glees, duets and songs, to be given during the evening. After the removal of the cloth, when all had done ample justice to the good things, grace was rendered most effectively by some of the vocalists. The Chairman then gave the usual loyal toast of "The Queen, and the rest of the Royal Family," referring in graceful terms to the sympathetic feelings of Her Majesty on all occasions when they were called forth by any portion of her subjects. The National Anthem was most enthusiastically given. This was followed by a selection of music entitled "Turkish Patrol," most exquisitely performed by Mr. James Hallé, of the Royal Aquarium, Westminster, and which elicited immense applause. The toast of the evening, "Success to the Larkhall Angling Society," was then proposed by Mr. W. H. Brougham, who referred to the growing prosperity of the club under the rule of Mr. Spencer, who by the introduction of occasional musical evenings in the club-room, and his general activity had exalted it to a most eminent position; and the attendance that evening was by far the largest the society had ever mustered was a grand and significant proof of its success. He remembered on the last occasion, through the great energy of Mr. F. Croutel, something like twenty guineas was subscribed in the room for prizes, and he had not the least doubt that that gentleman on the present occasion would resume his appeals, which he hoped would have at least a double result compared with last year. The society had altogether prizes amounting to sixty guineas to be competed for. Mr. W. Tucker, hon. secretary, whose name was associated with the toast, responded in well-chosen words, and reported that the gross weight of fish last season was 620 lb., the principal prize winners being Messrs. G. Watkins, G. Spencer, G. Penn, J. Green and E. Watkins. For the heaviest weight of fish, Mr. G. Spencer took the first prize, Mr. G. Watkins the second, Mr. C. J. Morris the third, and Mr. G. Penn the fourth, the latter gentleman also taking the ten-guinea challenge cup for the heaviest weight in one day during the season. The next toast was "Success to the Thames Angling Preservation Society," which was given by Mr. G. F. Spencer in a brief but complimentary speech, and in coupling the name of Mr. W. H. Brougham, he was quite sure all were ready to evidence their great regard for his valuable services on behalf of the anglers. The toast was very warmly responded to, and Mr. W. H. Brougham on rising to reply received a truly hearty reception. He observed that when he was amongst them twelve months ago he referred to the valuable work his society had then done in the prohibition of snatching and night-lines, and it was his duty to tell them of what the committee were then doing, but first of all as most of their members fished the tidal waters he desired to put them right as to the capture of the net some short time ago, as it was always his feeling to "give honour to whom honour was due." Had it not been for the arrangements of their head keeper, Harry Walters, who from information he had learnt, sought the assistance of Brown and Smith that net would never have been taken. He had heard from some of the members that one of the assistants on the occasion had assumed the entire credit of the capture, but it was not so, it was entirely due to Harry Walters, the others simply acting under his concerted arrangements. He regretted to inform them that on a more recent occasion, if his assistants had kept their appointments, Walters would have had another net, but he was left to witness the dragging alone, and being powerless he could make no attempt to seize the net. Mr. Brougham then referred to the work his society had then on hand in reference to some alteration in the sizes of fish, the season for catching jack, the prohibition of netting to Kew Bridge, the enlargement of the bait net for the use of fishermen only, and imprisonment of offenders of the bye-laws instead of fines, and after noticing of the increased support of angling clubs, and the recent gifts of twenty guineas from the West Central Association, ten guineas from the Central Committee, and ten guineas from the Central Association, he resumed his seat amidst immense applause. Mr. F. Boyce gave "Success to the West Central Association," which had done such great things for the anglers in the railway concessions, and he had the pleasure of associating Mr. P. Geen's name with the toast. Mr. P. Geen, on rising, was received with well-merited applause, and as one of the founders of the association referred to the help he had at the onset from the late Mr. Berger, one of their members; he always believed with him that the issue would be a successful one, and it has now been fully realised. After referring to some additional concessions, he spoke in high terms of the work and labour of Mr. Thomas Spreckley in connection with the Thames Angling Pres-

servation Society; their friend Mr. Brougham was well known to them all, and no one was more respected by the angling clubs and anglers than that gentleman. Mr. Spreckley, since his association with the society, had laboured hard for the anglers, and he had made the society more practically useful. Mr. Geen thanked them very much for his reception and for proposing the toast. The next toast was the "Committee and Other Officers," which was proposed by Mr. P. Geen, who complimented them on their successful position, and hoped they would support Mr. Croutel that evening in getting a good subscription for prizes. The toast was replied to by Mr. Davidson and Mr. F. Croutel, the latter taking up his usual appeal, and telling those present he should not be satisfied with less than fifty guineas. It was a scene of great excitement to witness Mr. Croutel picking out the guineas, keeping Mr. Tucker fully employed in putting down the names, and the result was most gratifying as realising the amount he wanted. "The Visitors," responded to by Mr. Caplin, was the closing toast on the programme. The singing which interspersed the toasts was of no ordinary excellence, and the talent displayed by the vocalists was of the highest order. Mr. Pickett gave "The King's Highway"; Mr. Bruce a selection; Mr. P. Fitzgerald, "Paddy Carthy's Courtship"; Messrs. R. Edmondson and G. Moore, "Excelsior"; Mr. C. Broadlake, "Eily Mavourneen"; Mr. Cranch, "Oh! oh! hear the wild wind blow"; Mr. H. J. Taylor, (in character), "The Mad Butcher"; Mr. R. Edmondson, "I never can forget"; M. W. Webb, "The Showman"; Mr. J. Lovett, "Alice"; Mr. G. Laurie, a Scotch song; Messrs. Lovett, Edmondson, Bruce and Sylvester, "Strike the Lyre"; Mr. G. Newman, a banjo song; Mr. Alfred Glover, "The Lost Chord"; Mr. T. Sylvester (in character), "The Naughty Boy"; Mr. G. Moore, "Come into the garden, Maud"; Mr. Miller, "I really can't keep still"; Mr. F. Howe, a banjo and bone song; Mr. W. Spencer, "The Level Crossing"; and Messrs. Lovett, Edmondson, Bruce and Sylvester, "Sleep, gentle lady."

CORRESPONDENCE.

[We do not hold ourselves responsible for opinions expressed by our Correspondents.]

SAVING FISH.

SIR,—5 large pike, largest 12 lb., 40 chub and 32 roach out of one ditch, belonging to C. Scott Murray, Esq., by the bailiffs of the Great Marlow Angling Association, through the floods.—I am, &c., A. MASKELL.
Marlow, March 19th.

PITH BAIT.

SIR.—In answer to "T. W. T.," I beg to state that nothing is mixed with the pith; it is thus prepared. The pith is the spinal marrow, of course, and when taken from the bone presents two skins. The first must be removed by cutting the column open with a pair of scissors, and then skinning it off with the finger and thumb (be careful not to injure the inner skin). Boil the pith for a few minutes till this inner skin becomes brownish, then shake it up with a little bran till dry. Cut it into suitably sized pieces, and ground bait with boiled brains, either chewed or cut up into minute pieces.—I am, &c., J. HARRINGTON KEENE.

PRESERVING MINNOWS.

SIR,—We suppose your correspondent, Mr. T. J. Horsley, must have had some minnows cured in what he assumes to be the North of England plan, and which he so emphatically condemns, in saying, "they are neither tough nor bright, but break if you are not careful in putting them on the hooks," but we beg to assure him it is quite a mistake. He has evidently never had any minnows properly cured with salt, which are really better than fresh ones, as they are tougher and quite as bright. We have no wish to condemn his plan, but only to correct any false impression his letter may have produced, as we have supplied thousands of minnows all cured with salt, and have never had a complaint. We have also used them, cured with methylated spirits, glycerine and salt, and prefer the latter after twenty years' experience, spinning, &c., with minnows.—We are, &c., HARDY BROTHERS.
Alwicks, March 21st.

[Having used Messrs. Hardy's salted minnows, we can fully bear out what they say, and would recommend our readers to make a note of the fact that they can always get salted minnows by post from Messrs. Hardy.—ED.]

SIR,—I noticed a letter in the FISHING GAZETTE last week anent "Minnows in spirits of wine," and, as we keep them in stock, have taken the liberty of sending you a bottle containing half a dozen. They are Thames minnows, and are very useful where it is difficult to obtain the natural bait.

Break the bottle and examine them. You will find them tough, and though not quite equal to the fresh minnow, have been the death of trout that would not look at an artificial. I do not think any house keeps them in stock, so have sent that you may, if disposed, mention where they are to be had. We charge 6d. per bottle (extra by post). They will keep for years like this.—I am, &c., B. R. BAMBRIDGE.

"FOSTER FUND."

SIR,—I have to acknowledge, with thanks, the following sums towards the above fund:—Norfolk, 10s. 6d.; Silver Trout, 10s.; South London, 10s.; Waltonian, 16s.; Metropolitan, 6s.; Prince of Wales's, 13s. 6d.—I am, &c., T. HOOLE, sec.

WHAT DO SALMON FLIES REPRESENT?

SIR,—Will some reader of the FISHING GAZETTE kindly inform me which insect or fly the various salmon and lake trout flies represent—the Libellas? By doing so they will greatly oblige,
THE MAJOR.
Prelavé, Bohemia, March 17.

[Salmon flies and "fancy" lake trout flies represent no living insects we are acquainted with, and are taken, we think, for small fish of some kind, just as the "Alexandra" fly—so deadly to trout—is certainly taken for a minnow. Some large trout flies represent moths, caterpillars, beetles, &c.—ED.]

YARE PRESERVATION SOCIETY.

SIR,—The annual dinner of the Yare Preservation Society will take place on Tuesday, the 19th of April—the President, E. Birkbeck, Esq., M.P., in the chair; and, as many gentlemen connected with the National Fisheries Exhibition are expected to be present, it is necessary that all members wishing to attend should signify the same to the hon. secretary on or before the 2nd April. It is absolutely essential that the Committee should know by that date the probable number of persons who will be present, to enable them to arrange as to where the dinner will be held. Tickets 5s. each.—I am, &c.,
London Street, Norwich, C. J. GREENE, hon. sec.
March 24, 1881.

WEST CENTRAL ASSOCIATION OF LONDON AND PROVINCIAL ANGLING SOCIETIES.

WANTED.

Address of society, name and address of secretary, and meeting nights of the following:—Bolingbroke, Hampstead, Knights of Knightsbridge, Nil Desperandum, North London, Havelock Brothers, New Globe, Old Artillery Ground, Royal Piscatorial, South Essex Piscatorial, Stratford Brothers, South Hackney, Sons of the Thames, St. James and Soho, True Waltonians, West Ham Brothers, and Walthamstow.

I have made application to each of the above by post, addressed to the proprietor of the old meeting house, but fail to get the required information. I am anxious to make my New List of Clubs complete, therefore, I shall esteem it a favour if any member of either of these societies will be good enough to supply me with the particulars.

I will keep the list open until Tuesday, the 29th inst., after that time it will be too late.

Please send direct to me—a post card will do.

T. HOOLE, hon. sec.

7, King's Road, Mortlake, S.W., March 22.

TROUT-FISHING.

SIR,—If "If Salmo Fario" will send me his address, I will forward him an article on "Trout-fishing in Lincolnshire," which appeared in a contemporary a few months ago.—I am, &c.,
Caistor, Lincolnshire, March 22. THOMAS FORD.

NATIONAL FISHERIES EXHIBITION.

SIR,—I have the pleasure to inform you that the Great Eastern Railway will forward all packages on their line to and from at single fare, and the other railway companies have mutually agreed to convey the same at a fare and a-half.

Exhibits should be forwarded as soon after the 28th of March as possible. None can be received after the 11th April.—I am, &c.,
March 24. W. OLDHAM CHAMBERS, hon. sec.

FLY-FISHING FOR ROACH.

SIR,—Will you allow me, through the medium of your columns, to thank Mr. Brunton for his article in last week's GAZETTE, on "Early Fly-fishing for Roach and Dace"? It has caused some amount of argument here, as well as surprise, many ardent anglers for roach with worm, paste or gentles being entirely unaware that the fish would rise to a fly. We have a river here literally teeming with fish, and, although I have angled in it with varied success for several years, I have never used a fly or seen one used here. I learn from inquiries made that a party of gentlemen *did* go fly-fishing on the Waveney some years ago, but with what success I cannot discover.

I, and many others in this neighbourhood, should feel greatly obliged if some of your numerous readers would kindly furnish us with an account of their experiences in fly-fishing for roach, with a few practical hints as to the kind of fly to use, and how and when to use it. I have compared the accounts in your paper of takes of fish by the various club members in and around London for the past twelve months with what I know to be average takes down here, and am really inclined to think that we must be living in a complete anglers' paradise, as 20 lb. and 25 lb. of roach, rudd and perch is nothing at all extraordinary for a day's angling. If, therefore, the artificial fly can be used here with any amount of success, a fresh item will be added to our amusement, for which we may thank Mr. Brunton and the columns of your valuable paper.—I am, &c.,
Beccles, March 23. CAXTON.

[We have frequently caught roach with the artificial fly and the natural house fly, but it has always been in a very *shallow stream* and near the edge; in deep water roach are rarely near enough to the surface to take or see a fly. Norfolk and Suffolk are indeed a paradise for anglers.—ED.]

THE "COCKSPUR WORM."

SIR,—As a constant reader of your most interesting periodical, I frequently find the "cockspur" worm mentioned as a good bait for winter roach-fishing, &c.

Being ignorant of this particular description of reptile, I take the liberty of asking if you or one of your numerous correspondents would enlighten me as to the kind of worm meant, and also where found, and if suitable for the deep reaches of the Warwickshire Avon.—I am, &c.,
SHALLOW.

CORRECTION.

SIR—Will you kindly correct one or two mistakes in your report of the City of Bristol Angling Association contest on the 6th inst., the name "Limley Stoke," should read "Limply Stoke," and the names "Ocesham and T. Hovey," should read "Oxenham and E. Hovey." By so doing you will greatly oblige our members.—I am, &c.,
17, Weston Street, Barton Hill, JAMES H. STANTIAL, hon. sec.
Bristol, March 22.

GEORGE JAMES EATON, of Starkholmes Matlock-Bath, Derbyshire, respectfully invites Noblemen and Gentlemen to try his standard FLIES for the present season. No flies sent or made up but what he himself has proved sure killers. A trial is all that is required from gentlemen who can fish to prove whether they may be genuine or not. Patronised by some of the best fishermen of the day. All flies dressed on the best Kendal hooks. Prices: Point Flies, 2s. 6d. per Dozen; Dropper Flies, 2s. per Dozen. Orders punctually attended to.—[ADVT.]

CLUB REPORTS.

AMICABLE BROTHERS ANGLING SOCIETY.

The West-Central visit of angling clubs, No. 2 District, Mr. Thorley, officer, took place on Monday, March 21. Mr. Bonvoisin kindly accepted the office of chairman, and was to be supported in the vice by Mr. Medcalf; but through an accident he was prevented from holding the office. Mr. C. J. Smith ably fulfilled the vice in his absence. Mr. Patrick commenced the harmony of the evening by singing "The Men of Merry England;" Mr. Phipps, "The Beggar Maid;" Mr. Fowler, "Revelry;" Mr. Robinson, "The Mermaid;" Mr. T. Lake, "Give me a grip of your hand;" Mr. Wicks, "Village Home;" Mr. Oram, "The Farmer's Dog;" Mr. Brook, "One more glass before we part;" Mr. Hunt, "Renouf;" Mr. Wood, dissolving views; Mr. Sav, "Will a monkey climb a tree." Mr. C. J. Smith kindly thanked Mr. Bonvoisin for taking the chair, which was responded to by that gentleman in a very effective manner. On the roll being called, the following answered:—Amicable Waltonians, City of London, Norton Folgate, Sir Hugh Myddleton, St. John's, Hearts of Oak, Bostonians, Bridgewater Brothers, Never Frets, North Eastern, Hoxton Brothers, North Western, Convivial, Canonbury, Good Intent; in all 16 clubs. Harmony resumed by Mr. White, "Down by the river side;" Mr. Brearley, "The grey mare;" Mr. Thorley, "Silver Bells;" Mr. Bonvoisin recited "The Frenchman and the rats;" Mr. Holt, a song; Mr. Rosen, a song; Mr. Patrick, "Dogerty the Tailor," and the last song of a very pleasant meeting, "A man you don't meet every day."—J. WORLEDGE.
March 21.

BATTERSEA FRIENDLY ANGLING CLUB.

The fourth annual dinner of this club took place on Tuesday last, Mr. W. H. Payne in the chair; Mr. W. Readwin, vice-chairman. Forty members and friends sat down to a substantial repast provided by the host, Mr. Pettet. After the usual loyal toasts, the chairman gave the toast of the evening the Battersea F. A. C. The secretary, in response, gave a flattering account of the progress of the club during the past season, being able to give good club prizes, and having a good balance in cash and some valuable prizes in hand to commence the coming season, and also thanking those friends who had subscribed to the prize list. W. H. Brougham, Esq., responded to the T. A. P. S., and L. Bonvoisin, Esq., for the W. C. A. A., after which the company went in for harmony, and some capital singing was given by Messrs. Howell, Webb, Drury, Wellman, Payne, Saunders, Blow and other gentlemen; Mr. Webb, sen., giving some beautiful solos on the violin, and Mr. Carver selections on the pianoforte, the harmony being kept up until an early hour, when Mr. Readwin proposed a vote of thanks to the chairman, dwelling at great length on his valuable assistance to the club, which was received with musical honours. After a vote of thanks to the stewards, responded to by Mr. Excell, the meeting was brought to a close, all present spending a most enjoyable evening.

THE DE BEAUVOIR ANGLING ASSOCIATION.

On the 13th Mr. Starkey 12 lb. roach; Mr. Dallimore, roach and dace; Mr. Foster some fine jack. On the 15th Messrs. Starkey and Spooner had a fine take of jack and roach from private waters, which presented a very handsome appearance when laid out on the trays in the club room.—J. NOBBS.

EDMONTON AND TOTTENHAM ANGLING SOCIETY.

Our members closed the season by fishing for a series of prizes, and our trays were fairly well filled. Mr. G. Stevens was, as usual, well up with roach and dace. Messrs. Collyer, Money, J. Hastler, perch, and Mr. S. Richards and Wray also had fish. Mr. Stevens, the local bailiff, is by no means hard up for assistants, and our members are in hopes that by keeping a sharp eye on the water the time will soon arrive when waters about the Angel-road will compare favourably with the waters higher up.—D. G. M.

EAST ANGLIAN PISCATORIAL SOCIETY.

The monthly meeting of the above society was held at the club house, the Great Eastern Wine Vaults (host Palmer's), on Tuesday evening last. The business being to elect new members and to decide date for next angling match. Five new members were then elected, and the secretary announced that this brought the club up to its full strength again, as several of the late members, owing to not paying up their arrears, were struck off the books. Mr. F. Bradley had also tendered his resignation, owing to pressure of business, and his inability to attend the meetings. The first angling match of the season was then discussed, and it was ultimately arranged to hold it at Coldham Hall on Thursday, April the 28th. The Chairman (Mr. W. G. Capon, of White Lion Street, Norwich), said that anglers of Norwich and its vicinity might congratulate themselves upon the prospects of the coming season, as reports of good catches and fine fish were even now coming in from all parts of the river. He trusted, ere long, that the pollution of the river now going on would be put a stop to, as not only would it interfere with the pleasures of angling, but also it would prove to be very injurious to the inhabitants generally. Messrs. Nockolds (secretary), Capon, Fowler, Palmer, and several other members then gave some capital songs and recitations, and the meeting ended.—ANGLER.

GREAT NORTHERN BROTHERS ANGLING SOCIETY.

We fished for our last batch of prizes on Monday, March 13th. Mr. Theobald won two, Mr. Dingley two, and Messrs. J. Watling, J. K. Fitch, and F. Jucker one each. Our total weight of fish for nine months (Sunday bank fishing only) is 1024 lb. 5 oz. We shall be very pleased to see any of our brother anglers and friends on Wednesday, April 6th, the opening night of our concerts—Mr. Page in the chair, and Mr. Parkin vice. Mr. C. Watling has kindly consented to conduct the concerts for the three months, and trusts you will favour him with your company. A large number of anglers have consented to take the chair in rotation.—J. FITCH, jun.
March 22.

KING'S CROSS UNITED.

The following members weighed in fish on the 6th inst.:—Mr. Armstrong, roach; Mr. Bell, roach; Mr. Morley, Mr. Davis and Mr. Woelfell, roach. On the 13th inst., Messrs. Davis, Woelfell, Armstrong and Morley, roach and perch. Mr. Armstrong wins the silver medal presented by Mr. Smith.—W. EMMS, secretary.
March 16.

RICHMOND PISCATORIAL SOCIETY.

The above society having become subscribers to the Thames Angling Society the committee of the T.A.P.S. invited them to meet them and the keepers of the T.A.P.S. to take part in the netting of the lake in the wilderness in Kew Gardens, on Friday week; the T.A.P.S. had permission to net on account of the large pike devouring some of the broods of ornamental water fowl, who would wander down to the lake from the ornamental water opposite the Palm House. Six of the members of the R.P.S. put in an appearance and assisted the members of the T.A.P.S. and their keepers in the capture of about a ton and a half of fish of all kinds, the principal being pike and jack, with a fair sprinkling of roach, perch, and tench, the largest fish taken out being two pike, one of about 22 lb. and the other about 18 lb. At the usual weekly meeting, held at the Station Hotel, the secretary reported that the two large pike had been placed in the river opposite the One Tree, Kingston, and the rest of the fish at various places further on. After the minutes of the previous meeting had been read, three new members were elected, making the society nearly eighty strong. Mr. Owen Davis presented the society with a very handsome pike of 20 lb. weight, Mr. T. Abbott presented a chub 4½ lb., taken by him at Teddington, and a perch of 2½ lb., taken by his deceased son at the same place. A very satisfactory letter was read from the London and South-Western Railway, granting tickets at a reduced rate to members of the Richmond Piscatorial Society only going to the various fishing localities on their line, on production of their card of membership. Mr. F. C. Clench gave in his report with reference to the riparian owners of the Upper Thames, and also stated that the Corporation of the City of London had taken the matter up very strongly.

ST. JOHN'S.

I beg to state that we had a splendid show of fish on Sunday the 13th. Mr. Thorling, 15 lb. of jack and perch; Mr. Hunt, a nice show of roach from the Thames; Mr. W. Clark, roach from Boxmoor; Mr. Goudge, dace from the Thames; Mr. Stevens, roach from Boxmoor; Mr. W. Larner had 9 lb. of roach from the Thames. Our late secretary, Mr. W. Oram, had a splendid jack of 14 lb. from Ashford station ballast pit. Mr. Carpenter, sen., had jack and roach from the same pit. Several of our members fished the Harp, but had a blank day. I am happy to state that all the above-named members won prizes.—F. L. T.

March 22.

THETFORD ANGLING SOCIETY.

The followers of old Izaak Walton were stimulated by the announcement of the Angling Society's Committee that prizes would be given for pike, roach, and perch caught between the town and Downham bridges from the 1st to the 14th March. The fishing for a long time past had been far from good, on account of the water coming down from the lands. The banks had been inundated, which for a great distance prevented the most ardent fishermen from getting near the favourite haunts of the pike. The water having gone down, however, during the last few days, many lovers of the gentle art were induced to rig up their tackle and encase themselves in their waterproofs and sally forth for the prizes to be given by the society. The loose, open conditions announced by the committee are open to objection. No instructions were imposed, but fishermen were allowed from the 1st to 14th to go as they pleased—a great temptation for them to use liggers, or any other unfair means to endeavour to obtain the 20s. prize given for a pike weighing 5 lb. It would have been better had they arranged to meet on certain days, at an appointed hour, not less than two rods being together during the stated time. Sunday fishing, too, should have been barred. The last day of the open season was taken advantage of by a great many of the fishermen. The water was in prime condition, and the day was beautifully fine for March; but no really good catches were made, for the heaviest pike taken did not scale 5 lb. One caught the previous day (Sunday) scaled near 9 lb.; this was taken by Mr. Thrower, and as there were no restrictions made he claimed the prize. Perch and roach were taken during the day, the largest being caught by Mr. G. Balls—prize, 10s. 6d.; roach caught by Messrs. Thorpe and Crack—prizes 10s. 6d. each—all having been properly weighed at Mr. Woods'. The genuine fishermen then looked upon the season as being finished by the supper which took place at the Green Dragon on Tuesday evening. The great number of tickets purchased for the spread showed a warm spirit was shown in the sport. About 90 sat down to a sumptuous repast, served up with Host Cash's usual judgment. The chair was ably filled by G. A. Marsham, Esq., supported by the Mayor (E. Frost, Esq.), J. Johnson, Esq., Dr. Archer, Dr. Clouting, J. and F. Honchen, Esqs., and many other gentlemen, with tradesmen, &c. After the removal of the cloth, the usual speeches, songs, and toasts followed.

WALWORTH WALTONIANS.

On Sunday, the 13th, several members of the above competed for five prizes, which consisted of a felt hat, and several bottles of brandy, whiskey and port, given by Messrs. Bayley, Boalch, Bansback, and Co., to those members who cared to go for them on that day. The result is as follows:—Mr. Irons took first prize, Mr. Weatherhead second, Mr. Bayley third, and Mr. Fox fourth. The fifth was not taken but was distributed among the members who were present at the meeting held on the 18th. A general meeting is called for the 25th, all members are requested to attend for the purpose of electing a committee to consider the four following momentous questions:—(1) The assessment of prizes taken during the last season. (2) Revising of rules. (3) The annual supper, and (4) the accepting of the challenge from the Surrey Piscatorials, to play a friendly game at cricket, and afterwards to dine together at the Greyhound, Dulwich, some time during the month of May.—PIXIE.

March 22.

THE WALTHAMSTOW ANGLING SOCIETY.

On Thursday, the 17th March, 1881, the members of this flourishing society met to enjoy a social evening and to celebrate the conclusion of their first year of association at their club-house, the Common Gate, Mark House Lane, Walthamstow. The president, Mr. C. F. Haines, being in the chair. After a capital supper, provided by the worthy host, Mr. G. D. Casey (the treasurer of the society), the cloth was withdrawn, and the Chairman proposed the health and prosperity of the members of the society, and in a very happy speech, congratulated them on the very satisfactory position of matters financially and otherwise, and pointed out that all such societies had troubles to encounter at first, but he was happy to say that those having been surmounted, he could foresee a favourable wind for the future. Dissension, which in a trifling degree annoyed them, had been entirely eradicated by the resignation of the chief dissident, and that all now required for the continued welfare of the club was "anglers," not "wranglers." (Loud and prolonged applause.) The prizes were then distributed, the list of which gave

great satisfaction, and evidenced the splendid piscatorial abilities of some of the members during the season concluded, prominent amongst which were Mr. C. Cashford, heaviest barbel, 8 lb. 14 oz.; Mr. D. G. Casey, heaviest weight of roach, 208 lb. 9 oz., and heaviest jack, 11 lb. 12 oz.; Mr. G. Lancaster, heaviest weight of bream, 85 lb. 10 oz.; Mr. J. Lathom, sen., heaviest weight of jack, 39 lb. 14 oz., with others too numerous to mention. In all the club had weighed during the season a total of 7 cwt. of fish. During a felicitous evening, interspersed with harmony of a varied nature, numerous handsome prizes were promised for competition by the members during the ensuing season, and several gentlemen present expressed their readiness to join the society.—HENRY HOWSE, hon. sec.

March 24.

WEST CENTRAL ASSOCIATION OF LONDON AND PROVINCIAL ANGLING SOCIETIES.

At a special meeting of the above Association, held on Friday the 18th inst., the following gentlemen were elected to fill vacancies upon the Anglers' Benevolent Society:—Messrs. Becket, Field, Noble, Welch, Hull, Marshall and Jennings. Mr. Hoole, the hon. sec., announced the fact that the Great Western Railway Company had kindly granted concessions to Windsor and Moulford, and have under consideration the running earlier trains upon Sunday. The announcement was received with cheers. As the next general meeting (April 15) will fall upon Good Friday, it was decided to hold a special meeting on Friday the 8th of April. All societies enrolled are particularly requested to send delegates, as this will be the annual meeting, and the election of all officers will take place. Thirty-nine societies were represented on the 18th inst., viz., Amicable Brothers, Angler's Pride, Acorn, Bostonian, Bloomsbury Brothers, Beresford, Cadogan, City of London, Cambridge Friendly, Duke of Norfolk, Duke of Cornwall, Excelsior, Golden Barbel, Good Intent, Hammersmith United, Hammersmith Club, Hampstead, Knights of Knightsbridge, King's Cross United, Larkhall, Metropolitan, Marylebone, Norfolk, North Western, Odds and Ends, Penge, Phoenix, Prince of Wales, Peckham Brothers, Royal George, Richmond Piscatorials, Savoy Brothers, Sir Hugh Myddleton, South London, South Belgravia, Trafalgar, United Marlborough Brothers, Waltonians and Westbourne Park. Also Messrs. Aldridge, High and Page, representatives from the East Central Committee. A new and complete list of the London angling societies will be ready for the delegates on the 8th April.

WEST CENTRAL ASSOCIATION.

(No. 1 DISTRICT VISIT.)

The return visit was paid by the Duke of Norfolk Angling Society, Duke of Norfolk, Norfolk Terrace, Bayswater, on Wednesday evening, 16th inst. The chair was ably filled by Mr. Darby, faced in the vice by Mr. Huggett. The club room, a large one, was well filled. Messrs. George, Blackburn, Green, Busbridge, Muddyman, Bonvoisin, Smith, Pearce, Stone, Lee, Williams, and Jennings, amongst others, contributing some capital songs and recitations. In the absence of the district officer, the roll was called, at 11.15, by Mr. L. Bonvoisin, when it was found that the following clubs in the district were represented:—The Bostonian, Cambridge, Duke of Cornwall, Duke of Norfolk, Hampstead, Norfolk, North-Western, Prince of Wales, Westbourne Park, and the City of London, from No. 2 (by Mr. Castell). A few minutes after the roll had been called, Mr. Osmond, whose entrance was greeted with repeated cheers, entered the room. Addressing those present, he apologised for his late attendance and explained the unavoidable cause of it, viz., that, as it was a special meeting night at his own society, there was a great deal of important business to transact, and, as chairman of the society, he was compelled to wait till it was concluded. He had made all haste, and his brother members and self had come over as quickly as cabbies could be induced to urge his steed. He felt sure that, under these circumstances, they would excuse his late attendance. (Hear, hear.) We were pleased to see among the visitors—Mr. Galloway, the host of the Norfolk Anglers, and Mr. Chandler, of The Rent Day. It is to be wished there were more who would follow their example—landlords, as a rule, like to see a good visit, when the turn to receive one comes, to the society held at their house, and it would be an act of courtesy costing little, and much appreciated, both by their members and those of the club they visit, if they would occasionally, when business allows, accompany their members when they return the compliment to a neighbouring society. Of the Duke of Norfolk Angling Society we will only say that, with a fair and daily increasing number of members, a good club room in a good situation, and officers of the right kind, and, above all, a proper host, they bid fair to become a strong and flourishing society. The next visit will be paid the Globe Angling Society, of which due notice will be given.—LEO. BONVOISIN.

March 24.

DAY, SON AND HEWITT'S

STOCKBREEDERS' MEDICINE CHEST.

FOR ALL DISORDERS IN HORSES, CATTLE, CALVES, SHEEP AND LAMBS.

In this chest are the following matchless and world-renowned remedies, all that a Farmer can require to cure disease amongst his Stock and keep them in fine, healthy, and buoyant condition:—

"CHEMICAL EXTRACT," for Wounds, Swollen Udders, and Ewes Lambing.
 "GASEOUS FLUID," for Colic, Scour, and Debility.
 "RED DRENCH," for Cleansing Cows and Ewes, &c.
 "RED PASTE BALLS," for Conditioning Horses.
 "BRONCHOLINE," for Husk, Hoarse, or Cough.
 "GASEODYNE," for Heaving or Paining.
 "ALCOHOLIC ETHER," for Colds and Chills.
 "CARMINATIVE CHALK," for Diarrhoea in Lambs and Calves.
 Price of Chest, with "Key to Farriery," £2 16s. 6d., carriage paid. Each article can be had separately.
 Patronised by Royalty, and used for over 40 years by the Leading Agriculturists of the British Empire.

CAUTION.—See that the Name of DAY, SON and HEWITT is on all Bottles and Packets.

DAY, SON AND HEWITT,
 22, DORSET ST., BAKER ST., LONDON, W.,
 AND WANTAGE, BERKS.

NOTICE.

Communications relating to the Literary Department, Fishing Tackle for Notice, Books for Review, &c., must be addressed to the Editor of THE FISHING GAZETTE, No. 12, Fetter Lane, London, E.C. and should reach the office not later than Tuesday morning.

Contributions are solicited, but the Editor will not undertake to return rejected MSS., unless accompanied with a stamped addressed envelope.

Correspondents are requested to write on one side of the paper only and give their real names and addresses, not necessarily as signatures to their letters, but as a guarantee of good faith. Unless this rule be adhered to no notice will be taken of such communications.

THE FISHING GAZETTE is published every Saturday, and can be obtained at Messrs. W. H. Smith and Son's Railway Bookstalls, and of the following, amongst other Fishing Tackle Dealers in London and the Provinces:—

Messrs. Alfred and Son, Moorgate-street.
Messrs. Price and Co., 8, Seymour-street, Euston-square, N.W.
Messrs. Williams and Co., Great Queen-street.
Messrs. Gee and Co., St. Andrew's-street, St. Martin's-lane.
Messrs. Gee and Co., Gray's Inn-lane (near Holborn end).
Messrs. Little and Co., Fetter-lane, E.C.
Messrs. C. Kewell and Sons, 197, St. John-street-road, E.C.
Messrs. Kewell and Co., 1A, Conduit-street, Regent-street, W.
Mr. J. Richards, 97, Church-street, Paddington.
Mr. W. Leader, 30, Upper Marylebone-street, Portland-place, W.
Mr. — Clark, 35, Wells-street, Camberwell.
Mr. Geo. Read, 91, Goldsmith's-row, Hackney-road, E.
Mr. A. Bulmer, 62, Wandsworth-road.
Mr. F. Oliver, 188, Great College-street, Camden Town.
Mr. J. E. Gold, 284, Waterloo-road.
Mr. D. W. Willoughby, 21, Lombard-market, Battersea, S.W.
Mrs. F. Y. Brocas, 4, Mill-street, Conduit-street, Hanover-square, W.
Messrs. Gillett and Co., 40, Fetter-lane, London.
Mr. Alfred Young, "The Golden Perch," 174B, Oxford-street, W.
Mr. T. Barnett, 26, Church Street, Lisson Grove, N.W.
Mr. J. Smith, 7, Tottenham Court Road, London.
Mr. Edwin Stevens, Newsagent, 220, Kentish Town Road.

OR

Mr. B. R. Barabridge, 74 and 75, High Street, Eton, Bucks.
Mr. Cowan, 33, South Frederick-street, Edinburgh.

Mr. S. Dale, 7, St. John Street, Nottingham.
Mr. H. Booth, 88, Prospect Street, Hull.

Newsvendors can obtain the journal through their London Agents.

* * The "FISHING GAZETTE" SPINNER (Registered) is sold by all the above firms.

ANNUAL SUBSCRIPTION.

The Annual Subscription, payable in advance, for the United Kingdom is 8s.; or post free, 10s. 6d.

To any part of Europe, the United States, and Canada, the Annual Subscription, including postage, is twelve shillings and sixpence.

ADVERTISEMENTS.

All communications respecting advertisements must be addressed to the Manager of THE FISHING GAZETTE, No. 12, Fetter Lane, London, E.C.

N.B.—All Remittances must be sent, and all Cheques and Money Orders must be made payable to ROBERT B. MARSTON.

The Fishing Gazette.

SATURDAY, APRIL 2, 1881.

IN SEARCH OF TROUT-FISHING IN NORMANDY.

IT is a truism to repeat that no change of scene in England has one-half the refreshing effect which a few days in France or Germany produce. It is all very well to feel a contempt for continental newspapers, but it is not a little pleasure to escape for a short time from the columns of news which are daily put before

the English reader; and one ought, when out for a holiday, to be really thankful that the conductors of foreign journals are so far behind their English *confreres* in energy and organising power. But at Easter time no one who cares for fishing can afford to neglect giving some thoughts to it. Easter, like Christmas, comes but once a year, and if the pleasant April time is neglected by the fisherman, he may never be able to make up for it during the live-long summer. Therefore, wishing to unite the change of foreign countries with at least an attempt to hook a trout, plans were at once made to spend eight or ten days in the fertile Norman country, and see some more of those grand churches and quaint old buildings which give it so unique a character among foreign lands.

And here it is natural to call attention—as I have done before—to the utter want of all information, reliable or unreliable, as regards fishing, in the handbooks for continental travellers. Why a person who has all his life been fond of his rod and his gun should be supposed by Mr. Murray to care for nothing but Gothic architecture, picturesque scenery, and the origin of cities, as soon as he has crossed the Channel, is utterly incomprehensible, but so it is, and apparently so it long will be. I am not forgetful of that useful publication, the "Angler's Diary," but it is not sufficiently large or detailed to be of any real assistance after it has given a general idea of some of the foreign countries and their rivers. Arriving, then, at Havre, from Southampton, and crossing by steamer to Honfleur, and thence by train to Lisieux, the first night saw my companion and myself ensconced in the Hotel du Normandie. Next morning, some time was necessarily spent in looking over this quaint old town, whose antique features are, however, now rapidly passing away. Then, setting off with our rods up the valley of the Touques, we prepared to see whether there were any fish to be taken in it. Having got well outside the town and gone about a mile along the road, we struck the river. What a sight it presented! A rapid current of chocolate was what it most resembled; obviously it was utterly useless for fly-fishing purposes, but we still asked a few questions of a civil labourer in the neighbouring farm, who told us that any one could fish there, and that all sorts of fish lived in the waters of the Touques, and that the trout were fine. But, as a matter of fact, unless a Frenchman or a German happens to be a fisherman himself, his information is, as a rule, wholly unreliable. He either speaks solely from imagination, or with so slight a substratum of fact, that his remarks are quite valueless. If cordially minded, he will fancy that he has heard of trout being taken, and consequently will endeavour to please the stranger by assuring him that the river is alive with fish. If he is in a hurry, or cross, he will probably forget if he ever heard of any one taking a trout in the waters in question, and he will say, in a downright fashion, that no fish inhabit the stream. However, we followed the river another mile, as far as the hamlet of St. Martin de la Lieu. We could admire the fertile valleys, covered with orchards in the pure beauty of their white blossoms, even if our feelings as anglers had suffered disappointment. True, it had rained heavily the previous day, but I doubt if at any time the Touques can be of much good as a fishing stream. The river, more to the north, in the department of the Eure, as we afterwards found, were clear enough. At any rate, as it is natural to have heavy rains in the spring time, and as the ten days' traveller cannot afford to wait three or four days for a stream to fine down, I put a mark against the Touques as one not to be thought of by the angler travelling in the spring. So much for essay number one. Much charming country did we see—a richer and a sunnier England—but trout there were none brought hence that night. The next day, Caen being one of the places to be visited, it was determined to pass on further, taking a look at the Dives where it

passes by the large village of Mézidon, but it was in exactly the same state as the Toucques. The accounts as to fish were contradictory; but it appeared doubtful whether the trout are numerous enough to make it worth while to put the Dives into the angler's calculations.

"Faute de mieux," as the French say, it seemed the only course, after Caen had been thoroughly visited, and consequently the second most remarkable town of Normandy had been made familiar to the mind, to turn back into the department of the Eure, to try what the Charentonne at Bernay was like, and if that were useless finally to make the best of the Iton from Evreux. And it may be useful here to remind the reader that the close time for trout and salmon is by the law of the 10th of August, 1875, and that of 22nd of November, 1875, from the 20th October, to the 15th of March, and for other kinds of fish from the 15th of April to the 15th of June, so that our sporting neighbours have in fact a close time for all kinds of fish. Bernay is a town very charmingly situated, much more primitive in its manners and customs than some of the larger Norman towns. Thus, the maitre d'hôtel sits down to dinner as one of the company, and in all respects considers himself the equal of his guests. whilst at the same time, with true French tact, he is always on the *qui vive* to take care that every one obtains what they require. But the accounts of the Charentonne were far from favourable, and it seemed very doubtful whether, even some miles above the town, it would be worth trying. Still, it was determined that if the morning were fine, as the scenery was pretty, no harm could be done by walking up to the village of Broglie—where is the seat of the once famous political duke who has disappeared into political darkness—and trying on our way for a trout.

But the first of morning sounds was the steady pour of the rain. So soon after eight o'clock, the railway station, and not the road to Broglie, proved to be our object, and before noon we were at Evreux, in the valley of the Iton—a town three hours' distance by rail from Rouen. After the wet morning it proved a warm day with puffs of west wind, so that, after a good walk, the cider of the country was not unacceptable. The cider of Normandy is an excellent beverage, and is always given gratis as part of the dinner; and many a thirsty traveller must often, as he quaffs it, think of old Olivier Basselin, the true poet of Normandy, who, in his simple mediæval fashion, sang, in the Vaux de Vire, "Hommage aux Cidre."

"O soulas de gosiers
O tres bon jus de pomme,
Prions pour le bon homme
Qui planta les pommiers."

A walk of a couple of miles from the Hotel du Grand Cerf brought us to the village of Arnières where a large mill stands on the Iton. Permission was obtained here to fish on M. le Duc's—the miller's—property. The stream was rapid for some distance. There was a dam, or some obstruction, then a long stretch of dead water, until the rapid flow from the mill again changed its character. Nothing seemed on the move, though the water, unlike that of the streams of Calvados, was little affected by the late rain. At last a small trout fell a victim to the attractions of a March brown, and then another or two. In the dead water there were undoubtedly good trout, but the puffs of west wind ruffled the water only here and there, and a regular gale was needed to make it really satisfactory fishing. However, at last, dropping the cast gently beneath a willow, a good fish dashed at the March brown. Whirr! went the reel, and away went the trout. But then there was a sudden rush toward the bank, and the dropper was securely anchored in the low, overhanging branch of a neighbouring willow. The fish was out of reach of the landing net, and before the branch could be brought

within reach of the net the trout gave himself a twist and disappeared. Another small trout or two was added to the basket, and a fair-sized fish was risen at the beginning of the dead water above the mill, and by that time it was necessary to turn our steps homeward with only half-a-dozen small trout, after a provoking first afternoon on the Iton—provoking, to some extent, because at the mill a gentleman from Evreux was encountered, also, like ourselves, an *amateur de la pêche*, who, with his small artificial minnow, had secured a fine trout over a pound, and a second nearly half the weight.

Of course, in an English trout-stream, a minnow would not have been allowed in water which should have been kept essentially for fly-fishing purposes, but in the "chasse" the foreigner looks rather to the bag than to the sport, whatever be his nationality, as I have found whenever I have encountered him in this pursuit—in the Tyrol, in the Black Forest, or in France.

The following day—a Sunday—was chiefly passed in a walk down the valley, through crofts and past mills, so that a thorough investigation of the river was made for fully ten kilometres down stream, to below the village of St. Germain des Angles; but from the amount of water carried through the meadows for the purpose of fertilisation, and the many cuts, it was pretty clear that the real fishing-ground of the Iton was above the town of Evreux.

Monday morning saw us on the tramp up the valley, with a bright sun and a blue sky above, and a feeling that the day would be more like one in England, in the leafy month of June, though in Normandy the primroses and wild violets, the wood anemones, the more stately purple orchids, graced the banks in profusion, and the meadows were yellow with cowslips. Passing the village of Arnières, about a mile above, there was a large mill, with a good piece of water below, so we determined to try for permission here. But on demanding if monsieur the miller was at home, we were referred to a stout lady, who, with French abruptness, refused permission. We pleaded that we were strangers, and in all probability might never have the opportunity of fishing there again. This appeal, *ad misericordiam*, only caused madame to refuse even more decidedly. The offer to present her with any trout we might take only caused a look of scorn to break over her not very beautiful features, and argument and entreaty being alike exhausted we retreated in no very amiable frame of mind from the mill yard. Half a mile higher up was the village of Aulnay, with yet another mill. Here we were confronted with another madame, the wife of M. Delille, the miller, but of a different kind. The old Norman type of countenance, the signs of a descent from the old Scandinavian rovers, the followers of Roric and Rollo, are still to be seen, and Madame Delille preserved them in her fair hair, her bright complexion, and her clear blue eyes. At first she hesitated but soon she seemed to come to the conclusion that her husband would not object to the delegation of his authority, and presently she ended her sentence with "Allez pêcher, Messieurs." But it was unfortunately a *jour de fete*, and consequently all the dams in the river seemed to be discharging their waters, and it was fully a foot and a-half above its usual tide, and somewhat muddied into the bargain. However, before long two small trout were taken, and then the writer moved over a half-built wall into the next field, where he was confronted with a hard-featured old peasant, who vouchsafed the information that it was his property; and apparently his dignity was so much injured by the mode of entry, that he would in no way budge from his obstinate "*Non, non!*" The next cottage being empty, the following was tried, and here another blue-eyed matron kindly vouchsafed her leave, and also went to the part belonging to the empty house, which belonged to her brother-in-law, and I was soon joined by her husband, a handsome and kindly peasant proprietor. Presently one trout, which

was, however, less than a quarter of a pound was landed, and in the meantime much conversation on all subjects, from angling to politics, took place, and the main gist of the political subjects was that, before all else, Frenchmen desire tranquillity. And then a small trout or two were taken before two o'clock, but the water was very unfavourable, and the "pounders" which seemed to inhabit the waters, were not to be allured. We parted from our friends in a properly cordial manner. The family were seated at dinner—not at the cabbage and bacon of an English labourer, but at rolled veal and asparagus, camembert cheese, washed down by cider, and followed by *café noir*. But a bottle of Bordeaux was opened in our honour and mutual healths were drunk to much clinking of glasses.

As we came out of the village we encountered the fisherman who shared with a gentleman from Evreux the right of fishing for a half-a-mile down the stream, for which he paid seventy francs a year. He was a professional fisherman, who sold the fish which he took, and his sole instrument was a net. His companion in this fishery was a professor at a lyceé in Evreux, and as we watched the former deftly cast his bell-shaped net into the stream, the companionship of the two seemed, to the English mind, incomprehensible. So far, indeed, as regards fishing, it would seem to have been a case over again of the iron and the earthen pots sailing down stream together. However, eight casts did he ineffectually make with many good-humoured growlings at the "*mauvaise pêche*" and the "*eau forte et troublée*," which was doing him out of his day's earnings. Of course, the trout he sometimes took were monsters, five to seven pounds in weight—a tale I venture to question, though, doubtless, in the deep mill pools there are some fine large trout, very likely two or three pounds in weight. Another small trout nearer M. le Duc's mill was basketed on the way home, but half-a-dozen was all the result of the day's fishing, thanks, we may fairly opine, to the flooded state of the river. Two days' fishing on the Iton had thus only brought a dozen small trout, and from the point of view of sport alone, were essentially poor days, though in other respects they had been most enjoyable. Much pretty country had been seen, and much varied character had been met with.

Next day the time had come for us to leave Evreux, but having a few hours to spare in the morning, it seemed best spent in M. le Duc's meadows, especially as there was a fresh breeze from the south-west and little sun. The river at Arnières was still more or less abnormally large, still it was worth trying, especially in the usually dead water, which to-day was not a little ruffled by the wind. Before very many minutes of fishing, a nice trout was hooked and safely brought to the bank, turning the scale at half a pound. Presently another rise, and another fish was hooked, but managing cleverly to secure the line to a branch passing down stream, he thereby made his escape. Presently the more rapid water was left, and the rest of the bank was lined with willows and poplars, some little distance apart, bordering in a more slow-flowing portion of the Iton. Here the fishing, with the strong wind, became rather delicate, but the trout were clearly on the look-out for insects dropping from the trees, and some of them were nice fish, which showed good sport when secured. Nearly at the end of the reach, just as the fly was making a circle with a gentle eddy beneath a willow tree, there was a barely perceptible breaking of the surface, and away went a trout for the opposite bank, running out several yards of line before his course was completed. Delicate handling, under the circumstances, was needful; but after a little patience, an excellent trout was placed among the daisies and buttercups, which brought the scale down to the pound mark. He was the best and the last trout I took from the Iton. When the basket was counted nine trout were placed side by side—one a pound, four half-pounders, and two

under a quarter of a pound. This was a very pleasant morning's sport for the two hours we were at work. The fly which took every fish was a moderate-sized February red, or rather one with a roughish claret body. The March brown and the olive dun were quite out of favour. The two fishermen with whom I had a talk on the previous day assured me that larger flies were better, and that mine were too small. This I doubt, for the morning's fishing clearly proved that the trout of the Iton took a moderate-sized English fly very readily. As a matter of fact, the French fishermen do not understand much about artificial flies. I have a native-dressed fly now before me, the "*Papillon jaspé au soleil*," a clumsy thing with big wings of a cock's wing and a large red body, which I purchased in the town as a curiosity. The better class of flies resembled an English May fly, and had all large light wings. The common kinds were all very gaudy, red and blue, some palmers and others winged, but all most inferior to those of English make. I should like to see one tried fairly with a smaller English fly, which would probably kill many more fish, unless they were in a particularly voracious mood. Indeed, you scarcely ever see a fishing-tackle shop in France, and these flies were quite an exceptional sight to me among the wares at an ironmonger's shop. Where there is any fly-fishing to speak of, there must be plenty of flies to be sold, and the fact that this is not the case, is a kind of circumstantial evidence that fly-fishing is really scarcely practised at all; and, therefore, that anything which is said as to the best size of flies by native fishermen, is probably based on the merest prejudice, and should not weigh in the balance against the judgment and the experience of an English angler.

E. S. R.

FISH FARMING AT CHERTSEY BRIDGE.

FOR several years Mr. James Forbes, of Chertsey Bridge, has been actively engaged in the culture of various species of Salmonidæ, and although the river which he intends to benefit has not at present received any material advantage from his work, the prospect is not far distant of its obtaining an increase of one of its best kinds of fish—the *real Thames Trout*. There is nothing in the way of speculation as to this result being realised—a visit to his charming fish-house at this time has afforded me tangible proof. In some of the troughs there is a fine collection of eggs taken from Thames trout that were caught at Sunbury last year. They are all in a most healthy condition, and fast approaching vivification. The eyes are plainly visible, and the eggs look strong. Mr. Forbes, I have no doubt, is proud of his work in this respect. It was the aim of the late Mr. Frank Buckland and his worthy coadjutor, the late Mr. Stephen Ponder, to accomplish this, inasmuch as every Thames angler regards the increase of their own fish in preference to foreigners, and I quite agree with some of my friends that we should turn our attention to carp and other fish suited to the river, in order to maintain a stock of the finny tribe for the largely-increasing number of anglers, whose constant visits must decimate its numbers to a terrible extent; but I shall shortly refer to this in a special article. I must now, after this little deviation, return to the fish-house at Chertsey Bridge, where, in company with Mr. Forbes himself, I am inspecting, for the benefit of my piscatorial friends, his splendid stock of ova and young fry. In addition to the genuine Thames trout, there are some thousands of the *Salmo Fontinalis*, and crosses of the *Salmo Fario* and Thames trout; the *Salmo Fontinalis* and the *Salmo Ferox*; the *Salmo Ferox* and the Thames trout; and the *Salmo Fario* and the *Salmo Ferox*; and besides these different crosses, in which Mr. Forbes has been wonderfully successful from his own hatching and rearing of fish, he has the *Salmo Ferox* and *Salmo Fario* separately, in all, about 27,000 partly vivified eggs,

and healthy young fry. He has just now shown me in a glass tube the splendid eggs of the Thames trout, which could not fail to elicit my highest admiration, and then in the various stages of fish development all the other kinds I have before enumerated, which are similarly satisfactory, some of each kind being more advanced than others from having been put in the tanks earlier. I have every year made occasional visits to the fish-house, and I must candidly confess I never saw the eggs and young fry so good as they are this year. I am sure Mr. Forbes himself must feel he has now arrived at perfection in fish hatching. It is a marvellous sight to see some young fry of the *Salmo Ferox* recently hatched in a slate trough—little tiny morsels full of life and vigour, and then in a glass tank below the same species that came into life twelve months ago, now about four inches in length, the very picture of health and beauty. One would have thought it impossible for them to have made such rapid growth, but it is no wonder, when they are fed on the best of rump steaks every day. Mr. Forbes may well feel proud of showing the contrast in the lively fry above with the well-developed fish below. I never remember seeing the entire stock of one and two years old fish in the various glass tanks in a more superb and healthy condition—and those in the large tank at the extreme end of the fish-house are exceedingly good specimens. Amongst them are a brace that got out of his stream at the back of the Chertsey Bridge Hotel some two years ago, and were afterwards caught in an eel basket in the portion of the Abbey river which at that point runs into the Thames. I believe Mr. Forbes is indebted to Mr. Cook, the respected proprietor of the mill, for getting them again into his possession, and highly appreciates the act. After an interesting inspection of the fish-house, of which I cannot speak too highly, we went outside to the stream which has been made by Mr. Forbes, which is divided into compartments, each being well stocked with fish up to 5 lb. each, the latter being the two Thames trout from which the ova I have referred to was taken, and the others, up to about 3 lb. each, that have been hatched at Chertsey Bridge. At the opposite side of each partition there is a shelter made for the fish, consisting of a piece of wood about twelve inches in width, and underneath which the fish run on the approach of any one. But here is Mr. Forbes with a plate full of liver or rump steak, portions of which he throws into the water, and there is an immediate rush of the occupants from their hiding covert, eagerly seizing the food, and filling the open space with active and vigorous life. Yes, and of splendid specimens of various kinds of Salmonidæ, which show themselves to immense advantage. I cannot conclude this brief notice of "Fish farming at Chertsey Bridge" without congratulating Mr. Forbes on what I saw. In the hatching of the ova—the healthy young fry—and his grand stock of fish life—everything was in full perfection, and a higher attainment appeared to me next to impossible. B.

FISH AND FISHING IN RUSSIA.

(From our Correspondent in St. Petersburg.)

(Concluded from p. 148.)

THE barbel (*Barbus fluviatilis*) Mirón Usatch; is confined to some of the rivers running into the Black Sea; weighs up to 30 lb. Baits—worms.

The roach (*Leuciscus rutilus*), Platvâ, common to all Russian rivers and lakes; ordinary weight, 1½ lb., sometimes 3 lb.; in the lakes of the gov. Perm, up to 7 lb. Baits—worms, rye-bread, silk weed, bloodworms.

The rudd (*Scardinius erythrophthalmus*), Plotwa krasnopiórka is to be met nearly everywhere, where the roach is to be found; weight, to 13 lb. Bait—worms, grubs, pieces of fish.

The gudgeon (*Gobio fluviatilis*) Peskar, inhabits all Russian rivers. Baits—red worms, brandlings, and bloodworms. The bloodworm is an excellent winter bait for most white fish.

The bleak (*Alburnus lucidus*), Ukléika. This little fish which is to be found in all rivers is seldom fished for, its only merit being that it is a good bait for many other fish. The usual baits are, house flies, small worms, gentles and blood-worms.

I nearly forgot to mention the Crucian carp (*Carassius vulgaris*), Zolotoï, Karas, and the Prussian carp (*Carassius gibelio*), Serebrianis. They are to be found over all Russia, in rivers, lakes, and ponds. Their usual weight is from 2 lb. to 3 lb., but in some lakes it increases up to 12 lb. and 15 lb. Both these fish are great favourites with many anglers, the best baits are worms and rye bread, kneaded into a paste, of course.

The eel (*Anguilla vulgaris*), Ugor or Ugr, inhabits only the rivers running into the Baltic Sea. Weighs from 8 lb. to 10 lb., and very rarely up to 15 lb. and 20 lb. Is very little fished for, the hook is always baited with a lob-worm.

Besides these fish, familiar to English anglers, we have some more, proper to Eastern Europe. These are: 1. The (*Lucioperca sandra*), Sudâk. This fine fish weighing up to 25 lb., and even to 30 lb. and 40 lb. (though very rarely), is common to most Russian rivers, those running into the White Sea excepted. It is not much fished for, the bait most in favour being a lively bleak or gudgeon, the greatest part of these fish, if caught by means of a hook, are caught on night lines. Spinning would, no doubt, prove a very killing method of fishing for these fish. Smaller ones sometimes take a worm or the tail of a craw fish.

2. The (*Lucioperca volgensis*), Bersh, a variety of the former seldom attains the weight of 6 lb. or 8 lb. It is confined to the Ural, Volga, Don, Dnieper, and Dniester. Baits as above, only it will take a worm more freely than the sandra.

3. The *Acerina rossica*, Nosâr, is a long-nosed variety of the ruff, whence its Russian name, "nos" (being the Russian word for nose), peculiar to the Don, Dnieper, and Dniester. Maximal weight ½ lb.; baits as for ruff.

4. The *Aspius rapax*, Sherespior, Gerich. This fish inhabits most rivers running into the Caspian, Black, and Baltic Seas, and attains the maximum weight of 30 lb. in the Volga. It affords much sport, being a strong game fish; sometimes it bites very boldly, at other times very warily. It has a trick, when not very sharp-set, to knock off the bait from the hook with its tail, and to run away with it. The favourite bait is a bleak, hooked on near the back fin. On some rivers a coarse artificial fly, dragged behind a rowing-boat, or cast into the current is a very killing bait. Red palmers dressed on hook No. 1 or 2, with a broadish gold or silver tinsel wound round it, have proved to be very killing, as well as a natural or artificial spinning-bait. But it must be remembered that these baits are used only by some ten, or even less, anglers.

5. The ide, *Idus melanotus*, Yás, is to be met with in all Russian rivers and lakes; it attains the weight of 15 and even 20 lb. The favourite baits are worms, grubs of cockchafer, crawfish and rye-bread paste. Small ide are taken with the bloodworm in winter; large ones will at times take a live bait, though very rarely indeed. The ide is a powerful fish, and often damages the tackle (though coarse) of unskilled anglers.

6. The *Chondrostoma nasus*, Podust, is proper to most Russian rivers, and attains the weight of 3 lb. It will bite very boldly in running water and very warily in mill-streams, if the sluices are closed. In the last instance, it bites as fine, and perhaps finer, than a roach. The tackle generally used is the fine roach tackle described above. Baits—rye bread paste, worms, and sometimes silk weed. Single hair for the hook length, and ground-baiting previously to fishing proves to be a very efficacious remedy against

the wariness of the chondrostoma, but neither of them is the favourite with my countrymen.

7. The *Abramis ballerus*, Sinetz, weighing up to 3 and 4 lb., is to be found nearly over all Russia. Seldom takes a bait; baits as for the bream.

8. The *Abramis sapa*, Glastách, inhabits nearly all Russian rivers; weight up to 2½ lb. Takes the worm only, and even that exclusively just after spawning.

9. The (*Abramis Vimba*), Sirt, weighing up to 5 lb., is to be met with in all rivers, running into the Black and Baltic Seas. It will freely take a hook baited with any description of worm, lob-worm, brandling, blue head or red-worm, or the tail of a craw fish.

10. The sly (*Silurus glanis*), Sorn, is to be found in all rivers, except those running into the White Sea, and attains sometimes a weight of 160 lb. Angling for this greedy fish is practised with very coarse tackle, sea-hooks being chiefly used. A stout rod is used in angling from the shore; in angling from the boat the line is held in the hand. Baits, worms, frogs, mussels (*Unio*), live baits (weighing sometimes 2 and 3 lb.), rooks, crows, pieces of meat; shortly, all that is by any means edible. It is by no means rare to hear that the sly has attacked men—drowning children, and wounding grown-up men.

AN "ACQUIRED" TASTE.

EVERYBODY has heard of the famous Berkshire breed of pigs; indeed, members of the much-prized pure, sleek, short-legged, black and white, curly-tailed family are now to be found in most all the counties; and should any fellow-angler be in the neighbourhood of a river where big trout, of fastidious pampered appetites, frequent, let him get, if possible, a bit of the true succulent Berkshire fat bacon—no other—as a last resort when all other lures have failed—for the following reason:—Not many years since, idlers upon Newbury Bridge, and the riverside residents also, had noticed a large fish disporting itself near to and under the said bridge that spans the Kennet in the centre of the town. Now, be it known that most all the fish hereabouts—aristocratic and plebeian—become "educated," so to speak, into looking out for all the unconsidered trifles that wasteful cooks or improvident kitchen-maids had thrown down the back kitchen sinks having outlets into the river. I have myself often seen roach and dace fighting for bits of bread, &c., that got into the river in the manner described. But this big fish—discarding flies and minnows and dace and the beautiful bleak—had, alderman-like, got used to something that was apparently as great a treat to him as ever calipash or calipee are to our modern municipal epicure. To be brief, the big fish had tasted Berkshire bacon, and liked the delicacy.

Hard by the Newbury Bridge—in fact, upon a portion of it, stands the Old Bank, and one of its partners—its semi-partner, in fact—is Mr. Charles Slocock, J.P., who, like his father before him, is a capital all-round sportsman, as good with the Craven Hounds in the Berkshire woodlands as he is in the partridge-field or by the riverside. He, too, had seen, or rather had *heard*, the big fish when performing this jumping and splashing business, so the thought naturally enough occurred that he would try and capture the scaly Leotard. Mr. Slocock, putting this and that together—as only hunters, shooters, and anglers can do, save diplomats—came to the conclusion that the big fish wouldn't make all this fuss over a poor dace or a bleak, nor even over any number of "ups and downers" (May flies), drop they never so "yellowly" upon old Kennet's bosom. No. Inspired thought! He baited his hook, like a true Berkshire man as he is, with a choice morsel of Berkshire bacon—a pinky bit cut out of the back, probably of

the size of a filbert—and cast his line upon the waters, not from the river's bank, but from the side window of Newbury Old Bank. The big fish was on the look-out. Thinks he, "Oh, Polly, the cook, has washed up the dishes, and here comes along a tit-bit for me." He plunged for the prize, but alas!—the cold steel had entered into his golden-tinged jaws, and was driven home by the delighted angler. After some fine "play," and with assistance, the fish was landed in a most difficult spot, and proved to be a splendid Kennet trout, that kicked the beam at ten and a-half pounds!

SPOTS.

PAINTINGS AT THE NORWICH NATIONAL FISHERIES EXHIBITION.

WE are requested to state that a special space has been reserved for the exhibit of paintings of a piscatorial nature, and the Committee will feel extremely obliged to any gentlemen who will lend paintings. Particulars can be had of W. Oldham Chambers, Esq. (Hon. Secretary of the Exhibition), Lowestoft.

THE NORWICH EXHIBITION.

WE beg to call the attention of our readers to the advertisement which appears in our columns respecting the arrangements for opening the exhibition and the railway facilities and reduction in fares.

THE LAMMERMUIRS.

THE Whitadder and its tributaries were opened after close time for anglers, on the 15th ult. It is generally believed that this will be a remarkably fine fishing season. The trout are numerous and in good condition. The rule of taking no fish shorter than six inches is a good one, and will be strictly enforced here. Of course, no angler worthy of the name will require supervision, as the old game of "Murdering the Innocents" is detested by all real sportsmen. Again, should the day be exceedingly favourable and the trout taking very freely, it is recommended that only half-pounders and upwards be retained. If these rules are followed the fishing will improve from year to year, and preserved waters become a thing of the past. A very fair fisher can easily capture in four or five hours about 10 lb. of trout. Anglers who spend the whole day on the water can therefore afford to put many small fry back, and still have as good a basket and much choicer trout. The upper part of the Whitadder is the best, and accommodation can be got, we understand, at the schoolhouse of Cranshaws, near Dunse, by applying to Mr. Pringle there.

ON FLY-FISHING FOR ROACH IN JULY.

Across the Exe, fair Exon near,
There is a bridge called Countess Weir;
Above the bridge a deep pool lies
At rest beneath the summer skies,
And on its surface often lie
Fish feasting on the fearless fly.
Rare ruddy roach that pass the day
In sucking-in their heedless prey,
With many a sparkling, silvery dace,
That cuts the wave with easy grace!
Here, 'neath July's unclouded sun,
With palmer red and small blue dun,
Have I drawn lightly to the shore—
Of roach and dace a goodly store.
Like down the feathered fairies fell
Above the fish that loved them well;
The water dimpled—yet again!—
And lo! I had a noble twain.
Thus often I, by twos and threes—
When favoured by a southern breeze—
Would draw them lightly to the marge,
Till—trust me, friends—my take was large!

F. B. DOVETON.

RIVER REPORTS

MID-THAMES.

"Hope is a lover's staff; walk hence with that,
And manage it against despairing thoughts."

—SHAKESPEARE.

The cruel east wind has rendered the river as chill as ice, and I fear that few respectable trout, under such conditions of the elements, will reward the toiler and spinner; but hope is a fisherman's rod (as well as a lover's staff); do not fail, therefore, my gentles and simples, to walk hence with it during the coming week, and manage it against despairing thoughts, and possibly great may be your reward. The river is bright and in good-looking condition, and big and little fish are reported to me, as having been seen feeding at most of the likely weirs between Windsor and Streatley during the sunshine of last week. At Maidenhead and Medmenham the ditches have been well looked up by Association bailiffs, and some 110 jack (best 12 lb.), 51 perch, 343 roach, 49 chub (best 4 lb.), and 1 tench returned to their Father Thames, and thus rescued from the wily sportsmen who hav'n't a soul beyond powder or wire. The Wycombe Trout Association hold the annual meeting on Friday next, at Mr. Bowden's, the White Hart Hotel, when it is intended to propose many salutary alterations in the rules, such as the extension of the season until the 30th September, and the restriction of bait to the fly only. I am invited to go and see some "beauties" at this fishery, and do not mean to be backward in coming forward, and will report anon.

Thursday evening.—River low and clear—strong wind (marrow freezing) blowing from north-east. Prognosis: unfavourable.—MARLOW BUZZ.

Thames (Goring).

Water in good order for trout fishing, but very cold winds. There has been a trout feeding this last day or two, and I shall try hard for him on Friday.—JOHN RUSH.

Thames (Windsor).

The bitterly cold winds of the last week have stopped trout frolics. Even in mid-day the sun has not been strong enough to induce them to appear; and he will be a brave man who can tackle four or five hours to-morrow if the wind is the same as this morning, and most certainly deserves to be rewarded. As regards the state of the water, it is perfection, and will necessitate fine tackle, having got as clear as it is possible for it to get; so shall not be surprised if a few fish are taken.—B. R. BAMBRIDGE.

Barle and Exe (Dulverton).

These rivers are very low and bright just now, and it is hard work to get a good basket of trout. Fishing with very fine tackle, and up stream is almost the only chance. The wind has been very cold from the N.E. during the last few days, with very sharp frosts, anything but good weather for fishing, and unless we get a change angling for the next few days will not be up to much. Some baskets of trout have been made during the last week, but their average has been small fish, chiefly taken with the blue upright, silver twist, small march brown, and watercress.—W.

Bure (Norfolk).

The late stormy weather has had a tendency to slightly damp the ardour of anglers, but, nevertheless, some very fair catches have been reported. About forty nice perch were taken close by Wroxham last Saturday, some, I am informed, with live minnows, but mostly with the ledger. I am very pleased to find that the river watchers on the stream have succeeded in bringing to justice two men caught liggering, one being John Crane, labourer, and the other, George Spanton, blacksmith, both of Hoveton. They were charged with illegal fishing on Wroxham Broad, contrary to the bye-laws, under the Norfolk and Suffolk Fisheries Act, 1877. Mr. Chillock, hon. solicitor of the Yare Preservation Society, appeared for the prosecution. George Clare, a river watcher, employed by the society, stated that on the day in question, he was watching Wroxham Little Broad. He saw the two defendants in a little boat about half-past ten in the morning; they were liggering, and he saw them take the liggers from the water; they were using double pike hooks, baited with roach. He told the men that he should summon them, and when he happened to meet with Spanton later on in the day, he threatened to do him some bodily injury, because of this. Spanton pleaded guilty, but pleaded ignorance of the laws. Crane said he was drawn into it innocently by Spanton, but it was proved that he was convicted of a similar offence in February, 1880. Spanton was fined 10s. and 15s. gd. costs, while Crane was mulcted of a penalty and costs of £1 5s. gd., the costs including the solicitor's fee. Well done, Clare, you have indeed caught a *sly old bird* this time.—ANGLER.

Colne (Thorney Broad).

The waters are in first-class order for angling. Trout-fishing opens on Friday. There has been a number of trout seen during the past few days; if the weather continues fine there are prospects of good sport. There has been nothing doing during the past week, the cold wind no doubt stopping many from coming out. We beg to remind our angling friends that our season commenced on the 26th of March for season tickets, subscription one guinea, day tickets are issued for bottom fishing, 1s., and trout fishing, 2s.—E. GODFREY.

Coquet (Weldon Bridge.)

Salmon-fishing with the rod opened on 26th, and there has been some good sport. Mr. Hedley killed 4 salmon; Mr. Stephenson, Hairdean, 2; Mr. Scott,

Felton, 3, and a dish of trout; Mr. Weed, Linden, 1, from 2½ lb. to 8 lb. On the 28th, Mr. Leighton, Theselhaugh, killed 8, 35 lb. weight; Mr. Hedley, Felton, 6, from 3 to 8 lb. On the 26th, Mr. Marsden, of Morpeth, 3, 15 lb. weight; Mr. A. Dobson, Felton, 2, 8 lb.; Mr. Hedley, Felton, 1, 3½ lb.—A. GLASS.

Dove (Derbyshire).

Both weather and water are now in favourable condition for fly-fishing here in the Midlands, if it were not for the nasty winds. The March brown is just coming out on the Dove, and several takes have been effected by it already, one of which (numbering 3½ brace) was obtained below Mayfield. Great things have been done when this fly appears in unusually large numbers, and as they are already fairly plentiful, something unusual will most probably be accomplished here during the ensuing week or two. Minnow-spinners have plied the rod very successfully since my last; 3½ brace of heavy trout were taken from the Henmorn, on Friday, with the natural minnow, as were also 2½ brace (scaling 5½ lb.) from near Mayfield on Monday, with the "universal killer." A few gentlemen have taken two and three brace in the evenings since my last both with fly, minnow and worm. The wind is still rather cold, but the sun is getting powerful in the middle of the day, causing the flies to appear in greater numbers daily.

Exe (Exeter).

It has very rarely of late been my lot to report of good times, but since my last report news has reached me from various parts, viz., from rivers with which I have nothing to do, therefore will not venture to report that which I hope will reach you from other sources, but suffice to say that sport all round has been excellent. Our river is teeming with the silver beauties, and many a noble fish was seen on the green sward during the past week. The gentleman who, as reported in last week's FISHING GAZETTE, had killed eight salmon and nineteen trout, added three splendid fish to his creel on Saturday last, weighing respectively 1 lb. 8 oz., 1 lb. 9½ oz., and 1 lb. 12 oz., beautiful clean run fish, in fact I do not see how they could be otherwise, for a kelt or slat I have not seen since the late flood. Mr. Pearson also added another to his creel on Saturday, and two others were taken near Trews Weir on the same day; so that, after all, we must not consider the river Exe such a late river as some would have us think, and my opinion is that it is out of the power of man to make an early river late or a late river early. I have known but a very few fish to be taken from the Exe before May, and I have seen a clean run fish in January on the banks, partially eaten by otters. Very few trout have been taken, no doubt partially owing to the very bright weather accompanied by north and easterly winds. Mr. C. Blake, of the Museum Hotel, while fishing for bass and flat fish, caught one of the finest Lucky Proach (*otus bubalis*) I ever saw, measuring 8 inches long and 6 inches round, splendidly mottled in tortoiseshell colours on the sides, belly light blue verging into green, the palate, tongue and throat a brilliant blue—numbers of these fish have passed through my hands, in fact, the largest previous to this I gave to the Albert Memorial Museum here, but it is nothing like so fine a one. I omitted last week to state that M. Pinot, a French gentleman, wound up the open season by taking a splendid pike, 24 lb. weight, from the canal near Burlescombe, and from the information received hopes, when the season opens, to visit this part in company with your occasional correspondent, "J. A. K." The fine weather seems inclined to hold out, so that we may yet say, like a lamb the month of March has left us, although a lion it came in.—FRANK GOSDEN.

Lee and Blackwater (Co. Cork).

Easterly winds have set in again, and the weather since Tuesday has been harsh in the extreme. For the four days previous to the change there was capital sport. The best bag was made by Mr. George Haynes, who, on last Thursday, landed eight springers of the aggregate weight of 82 lb. Four of these were taken out of one stream, and all were hooked on the worm, the branding. Tired of the fly the fish are now beginning to take the worm freely, and in bait fishing Mr. Haynes has no superior. On the same Thursday, Mr. Henry Dalz brought four to bank, three of which were taken on the fly and one with the worm. Mr. Dale was also out on Tuesday, and placed four more to his account. Mr. Haynes on Sunday landed three, and on the same day Mr. Lambkin two, one of which was a fine fish of 14 lb. Sir Augustus Warren killed seven in two days, on his preserves at Warren's Court, and among the other successful anglers were, J. Readon, two; Captain Abbott, two; Sir Oriel Forster, Major Nettles, Mr. George Colthurst, J. Manning, &c. At Itown yesterday, some poachers were fined for fishing with illegal nets. The Blackwater is now in fine condition for angling, but the cold weather has doubtless interfered with sport and driven the fish out of humour to the bottom.—ANGLER.

Severn (Kidderminster).

The Severn has been again troubled with snow water, which has made it against anglers, but should the weather continue fine, I think it will be in good condition for the end of the week. A few brace of trout have been taken by some members of the Kidderminster Angling Society, in good condition. The above society will contend for prizes on Easter Monday, jack fishing only. The contest will take place in the Severn, between Bewdly and Highly, when a highly-contested match is looked forward to. Mr. A. G. Titley, Swan Hotel, Kidderminster, in company with Mr. E. Laurence, have had some capital sport among the trout in Shropshire, having taken 32 brace in fair condition, weighing 27 lb., taken with the worm. Some of them were over 1 lb. each. Mr. J. Williams and W. Mound, after trying a long time with brains for chub, did not succeed in taking one, and while sitting on the Severn bank, taking refreshment, Williams saw on the bank a piece of lobster shell. Imitating a spoon, he placed it on the hook, and threw it in for amusement several times, when at last he found a tug, and, on drawing it, found to his astonishment that a jack about 4½ lb. had seized the piece of shell, and the skilful play of Mr. Williams succeeded in drawing the fish and bringing him to the water's edge. But alas! the bank being steep and slippery, and being without net or gaff, could not lift the fish with line, and so the fish made good his escape, and disappointed his would-be captor.—ANGLER.

Severn and Teme (Worcestershire).

Some few local anglers have been out, and a few trout have been landed, but the takes are small, both as regards size and quantity, and the worm is the bait as yet. As soon as the wind chops to the south, and a shower of warm rain, I shall expect some good sport with the minnow; also the fly-fisher. Will try the early brown, the blue dun, and red spinner. This fly is the blue dun after it has cast off its dun coat, which it does in about four or five days. It is a morning and evening fly, as it cannot, or will not, fly for long in the bright daytime; but with the three flies named I will fish any one if they will choose any

other cast of flies. The brooks are in good order for trouting, and I shall recommend the brandling worm. Well-scoured in moss, it makes them tough, bright, and also gives them a flavour and smell that I have proved is favourable to good sport.—J. A. GRIFFIN.

Suir and its Tributaries (Clonmel, Ireland).

We had some rain on Wednesday last which brought down another flood. Consequently, between it and having frost every night, there have not been so many fish killed as there might have been. The water has again run down, and those that cared to face an easterly wind had some good sport. On Friday Col. Peyton landed five fish, and on Monday four. Mr. Thompson got seven salmon during the week; Mr. Dalton one, 25 lb. Thomas Phelan, on Lord Donoughmore's preserves, killed four. Dr. Cooke has landed two or three fish almost every day. At Newcastle, Rochestown waters have been taken, and two salmon caught there already. Mr. Quinlan and Dr. Donaldson caught one each at Suirsmount. Tom Russel and James O'Donohue at Clonmel killed a fine fish each, and several others were also successful whose names I have not procured as yet. On March 29 the Cahir Club landed nine fine fish. The cot men at Clonmel did very little, owing to the river being flooded; they only got sixteen for the week, and the cots lower down did comparatively nothing. Between Cashel and Thurles the river has been dragged by nets, and the poachers could not be captured. We also hear of both old and new salmon being caught by poachers on the river Tar. If there were funds enough to protect properly the Suir, there would be no ends to the stock of fish it would contain. The trout fishing has been very good. Mr. Lyster (Dublin), at Grove Stream, in a few hours had splendid fishing, killing sixty-seven good-sized trout, weighing 19½ lb. Charlie Milan got twenty-two large trout on Sunday last, fishing from Kilshielan down to Carrick. Mr. Middleton kills every day. The best flies for present season are March brown, orange grouse, and red hackle. The weather is intensely cold, and glass steady.—DORA.

Swale.

Very little has been done on the upper reaches of this splendid trout stream, owing to the presence of heavy drifts of snow, which yet remain on the tops of the mountains. When these are gone some good sport will be had. Local fishermen generally begin with the minnow, which is a most killing bait, owing to its scarcity in these waters. A discussion has recently taken place in these columns as to methods of preservation. The Swaledale fishermen adopt a plan which quite beats curing out of the market. At this time of the year they go over to Wensleydale with a small mesh landing-net and a tin can which will hold a gallon or so, and collect from the small brooks which there abound a store of two or three hundred fish, which they keep alive. By changing the water about twice a week they can be kept in a large pan during the whole of the season. They are then taken to the waterside as required, in a workman's small tea-can. No one hereabouts, except a casual visitor, uses artificial baits. Now that the Midland Railway runs to Hawes, let me advise anglers who like good trouting to run over to Swaledale Head. They will here find a perfect El Dorado. I have often caught ten or twelve dozen in a day, and the fishing is free and open. In fact, the population is so sparse that the natives are always glad to see strangers, and are, furthermore, hospitable to a virtue. I shall be glad at any time to supply information required, and will, if possible, send a list of flies next week with which to commence the season.—THOMAS FORD.

Yare (Norwich).

The obstinate north-east wind have prevented many rodsters from turning out this week, and those who had nerve enough to do so have come home with anything but a full creel. Messrs. Webb, Capon, Hart, Howard, Palmer, Nockolds, members of the E. A. P. S., were all out the early part of the week, but nothing of any importance was done. I am sorry to hear that a great many pike are being taken by snares, or, in the fishing parlance, "collared." Persons are under the impression that this is not illegal; but should our vigilant river watcher meet with them, they will find themselves labouring under a great mistake. Dykes and small outlets are the spots where these poachers usually practise, as they are aware that the fish are now migrating up these places to spawn.—ANGLER.

Trent (Nottingham).

So far as fishing in the river is concerned, I have little or nothing to say. Dace have been seen on the shallows going through the spawning operation, but not in such quantities as if the weather had been fine and warm. Pike are also going through similar work in the backwaters, and should be strictly watched during the next month, as they will be, after spawning, in a perfectly helpless condition. Angling is still going on in the private water near to Nottingham, and some capital baskets of roach and bream have been caught, both fish being in the best possible condition, and I think with most of our rodsters here that it is a great pity and wrong that we are not allowed to angle for roach and bream until the middle of April, as both fish do not deposit their spawn till the end of May, and in some rivers later than that. They take the cockspur worm freely at this season of the year, more especially when the water is slightly discoloured. I give a description of this noted bait elsewhere which must be paid particular attention too, or your readers will not understand my meaning.—W. BAILEY.

Waveney (Beccles).

Owing to the reappearance of winter during the past week, the river is not in the best of order at present, and I fear there is not much prospect of sport for the next few days, unless the weather and the wind should change. It is said that "variety is charming." If this be applicable to the weather, we may be said to have had a "charming" supply, for there has been "variety" enough—sometimes a little sunshine, but more often cloudy, then a downfall of snow, the performance varied occasionally by a selection of unpopular airs by the east wind. I hear that a few pike have been taken by one fisherman during the past week, but very few anglers have been out, and those who did venture got but very little reward for their trouble.—C. B.

Wye and Derwent (Derbyshire).

Both the above rivers have run down nicely during the week, and are now in splendid condition for angling; and I am pleased to say that a good many fishermen have been out on both rivers, and most of them have done very fairly. Last Friday, the 25th inst., was the opening day for trout on the Darley Dale Club waters, and some very fine fish have been killed with fly, minnow, and bottom-fishing with the worm. April 1st is the opening day for trout on the Wye; there being no restriction as to grayling at any time of the year, which, in my humble opinion, is quite wrong. Why should the only fish that affords really good sport at the season when no other fish will rise to a fly,

be so little thought of and persecuted? I can only say myself that, if they are not better protected, our Derbyshire Wye will not be worth fishing. Only look at the great quantities of grayling that died last year of disease; they are getting scarcer and scarcer every season now. It is thought by many that the grayling destroy the spawn of the trout. Now this is a complete mistake. All practical men, I feel sure, will agree with me that the greater portion of the trout spawn in the brooks, and very few, if any, in the main river. Now grayling do not run up brooks, and it is very rarely indeed that we find a grayling in them, unless they are of a large size. How can grayling, then, take the trout spawn? The small grayling, called shot grayling, about five to the pound, do not spawn, and are capital eating the season through. The night-line party I hear have killed a few trout during the week in the Derwent with large lob worms for bait. Fly-fishing prospects good for a few hours in the middle of the day, while the bright hot sun is out. The killing flies have been bumble, furnace and spider flies; and the fish have been killed chiefly by the sides of the streams.—GEORGE JAMES EATON.

Starkholmes, Matlock Bath.

Yore (Yorkshire).

I am sorry to say that trout-fishing still continues to be a "delusion and a snare" in this district, which fact is no doubt attributable to the keen frosts that have prevailed every night. The few brace that have been caught have fallen victims to the "little brown" or "woodcock and orange," as it is locally called, neither the blue dun or March brown being yet on the streams. Jackson's dressing for this fly is as follows: wings, feather from inside of a woodcock's or hen pheasant's wing; body, red copper-coloured silk; legs, brown hackle; it is a capital fly for the early spring months. To any angler who may be meditating a visit to our Yorkshire streams, and who is at a loss what flies to select, I strongly recommend a little work on trout-fishing recently published by Mr. T. Ford, Caistor, Lincolnshire. It is a thoroughly practical book, written by an enthusiastic fly-fisher who has spent many years of his life in our Yorkshire dales; a great number of his patterns for artificial flies are taken from a book published some years ago by a veteran angler who resided in this county, and a better guide he could not have followed, as I can testify to from experience, having many a time been indebted to that same little book for a heavy pannier of trout and grayling. Mr. Ford's book is written in a very similar style, and at once stamps its author as a man of poetic temperament, and a keen admirer of the works of Nature, and I feel sure that all fly-fishers will find it worthy of a place in their library of angling literature: at all events, I welcome it as a valuable acquisition to mine.—FRANCIS M. WALBRAN.

SCOTCH REPORTS.

(From Scotsman.)

THURSO RIVER—BRAWL CASTLE.—Last week in Thurso district there was much inclement weather. The fish killed during the week were as follows:—21st—Mr. Wason, two, 18, 22 lb.; Mr. Maitland, two, 9½, 8 lb. 23rd—Mr. G. Ashley Dodd, two, 17, 6½ lb.; Mr. Maitland, two, 9½, 9½ lb.; Mr. Dunbar, one, 10 lb. 24th—Captain Fairfax, R.N., one, 10 lb. 25th—Mr. Maitland, one, 16½ lb. 26th—Mr. G. Ashley Dodd, two, 11½, 8½ lb.; Captain Fairfax, one, 17 lb.; General Mignon, one, 18 lb.; Mr. Maitland, one, 17 lb.; Mr. Dunbar, one, 8½ lb.

LOCH TAY.—On the Killin Hotel water the takes on Saturday were:—Sir Wm. Fielden, Scarborough, one salmon, 23 lb.; yesterday, Sir Wm. Fielden, Scarborough, one salmon, 16 lb.; and Mr. Malloch, Perth, one salmon, 24 lb. On the reserved water at Killin the results, yesterday were:—Mr. Earp, Derby, five salmon, 22 lb., 19 lb., 16 lb., and two 16 lb.; Sir Wm. Elliot, one salmon, 16 lb. On the Kenmore reserved water, Provost Wilson, Govan, killed on Saturday one salmon weighing 16 lb., and also a fine fish weighing 34 lb.

THE TWEED—KELSO.—The more genial south-west wind which prevailed yesterday gave anglers some hope of sport, but the result of the day's fishing was disappointing. Mr. Farrand and Mr. J. A. Bushfield fished in the Sprouston water, but only landed a kelt and two trout; and other anglers reported that fish were not taking at all.

CALLANDER.—Lochs Lubnag and Vennacher being now free from ice, both lochs are expected to be in fine order this week. Mr. McLaren, tailor, caught on Loch Lubnag, on Friday, a fine fish, weighing 16 lb.; and another of 13 lb. was caught in the river on Saturday by Mr. Anderson.

LOCHLEVEN.—The first taken of the season was by Mr. R. Lindsay, of Dunfermline, who was out for an hour yesterday afternoon, and landed a trout weighing 1 lb.

THE YORKSHIRE RIVERS.—I am very glad to see that Mr. Thomas Ford, the schoolmaster-poet of Caistor, Lincolnshire, has turned his attention to a graphic description of the Yorkshire streams. Mr. Ford is an elegant writer and an accomplished fly-fisher; and although he is now removed from the scene of his delightful northern reminiscences, his soul appears to be earnest in the endeavour to increase the sport of his brethren, he having already, at his own expense, and by the assistance of his friends and neighbours, already made some of the more important rivulets around Caistor joyous with trout life. I wish him every success with his little shilling manual of flies, and send for it together with a supply of "barbed features" for the present season.—G. F.

FISHERY INQUIRY AT HEREFORD.—Mr. Walpole and Professor Huxley, the two fishery inspectors, held at Hereford on Wednesday, the last of their series of inquiries as to the cause of the Rebecca disturbances in the upper part of the Wye, which had been attributed by the rioters to encroachments on their rights to fish in that river with the spear for salmon. It was alleged at the former sitting that the scarcity of fish in the upper country was due to excessive netting in the middle and lower portions. Witnesses from above Hereford said that the quantity of fish which passed the nets had much fallen off, and that the angling portions of the river were not nearly so well supplied as ten to fifteen years ago. The inspectors will shortly report to the Home Office.

CLEVES HUNTING AND SPORTING EXHIBITION.—The opening of this exhibition has been fixed for June 12th. The lists of applications for space from this country will be transmitted to the central commission at Cleves at the end of the present week. Intending exhibitors can obtain forms upon application at the International Exhibition Offices, 1, Castle Street, Holborn.

THE SAUCHIE FISH-REARING PONDS.

As many of our readers are aware, Sir James Ramsay Gibson Maitland has for years been conducting experiments in the hatching and rearing of salmon and trout in artificial ponds at Sauchie. At Howietoun, and within a few hundred yards from the hatching-houses, a convenient spot has been selected as the site of a series of ponds, laid out after an ornamental design, the waters of which swarm with salmon from a month to five years old. The fry are conveyed from the hatching-houses in specially constructed iron despatching chests, mounted on wheels, and are placed at first in several small ponds. These are supplied with water from Sauchie Burn, where a sluice regulates the flow through two spigot and faucet glazed clay pipes, ten inches in diameter, which discharge into settling wells at the head of the ponds. The water is not admitted to the ponds direct from the well, but passes through a process of purification intended to separate foreign matters, and to prevent as far as possible the clogging of the bed of the pond by a deposit of any kind other than is precipitated from solution in the liquid. Passing out of the settling well, the water travels underground over a bed of rough gravel placed underneath the walks at the head of each pond. These rough stones form a kind of filter, which is renewed from time to time as the ponds are cleaned out, generally twice a year in the smaller ponds, and once in twelve months in the larger sizes. The water finds its way out of the ponds through a screened outlet in the bottom, and wells up in spring-like fashion from the bed at the head of the pond next below. The precaution is necessary of protecting the outlets and inlets to these smaller ponds very carefully with perforated screens, as the young fry at the period when they are placed in these smaller ponds are very difficult to confine. It has the further advantage of preventing the fry from injuring themselves by rushing against a head weight of water, or inducing the growth of a fungus on their backs by jumping against falling water. On an average each of the first six ponds contain 50,000 to 60,000 fry, of the size at which they leave the hatching grilles. These ponds have therefore accommodation for 400,000 fry of each crop, or 800,000 in one season. In a series of twelve ponds where young fry are placed previous to transportation, there is ample room for at least 660,000 more, being equal to a supply of 1,060,000 each crop, or 2,120,000 per annum. This enormous number of fish will be readily disposed of, the value of stocking waters as a preventative of the decay of fishing becoming more and more recognised. In these small ponds the half-inch fry are fed with horse flesh and crushed grain, which by an ingenious arrangement is dropped through water sieves into the pond. In the pond adjoining the first there is a depot for burn trout of a twelvemonth old, of which there are 2000, hardy brown fellows, who jumble and tumble on the top of the pond when food is thrown to them in the liveliest possible manner. The water runs from this pond through a settling well and syphon into two others in which American trout and hybrids are lodged. These ponds are some 90 feet long, by about 40 broad, and 16 deep. These hybrids are between salmon and burn trout, sea trout and yellow trout, &c. Next these hybrids lie three ponds in which are springlings, of from three to five inches in length, and on an average about fourteen months old. These have not yet assumed the bright silvery garb of the salmon tribe, and are thus in capital order for sending to other waters, where they will be little molested with predatory fish—in fact, to preserved ponds and burns.

Up till 1879 this series completed the extent of the fish ponds at Howietoun on the construction of which Sir James Maitland had expended over £11,000. Since then he has added a very large basin for the reception of the larger fish, with the view of learning more of the natural habits of the creatures he so successfully rears from the ova. This experimental pond will doubtless furnish the solution of many difficult questions as to fish—propagation, migration, &c., which are still mysterious and unravelled. With this view a summer-house has been erected in the pond. Leaving the bank on a bridge, one can descend by means of a staircase to the bed of the pond, and there, through the windows of the house, learn somewhat of the movements of the finny inhabitants of the waters. Sir James, it may be here mentioned, has been closely studying the vexed question of the disease afflicting the salmon of the Tweed, Solway, and other rivers near the Borders, and claims to have discovered its cause. He is at present engaged in preparing a treatise on the subject, and it is almost superfluous to add that, being the result of actual observation and experiment, it will be an undoubted authority on the matters with which it deals.

During 1881 it is proposed to rear in these ponds 8000 two year olds, 16,000 yearlings, and 140,000 springlings, 250,000 fry of Lochleven trout, and about 10,000 American trout, besides the salmon ova just hatched out. To supply these shoals a very extensive supply of mussels, clams, and horse flesh is necessary. Apparatus is fitted up in houses adjoining the ponds where the shellfish are cleared from their outer coverings, and mincing machines are placed for the horse meat. Some three horses a week and tons of shellfish are needed. Only animals in perfect health are used, and with the view of ascertaining the certainty of this, a month's quiet holiday grazing at Millholm is allowed. A very successful system of rearing the snail peculiar to Lochleven has also been working for some time, and on these it is found the fish feed greedily, and improve in weight with great rapidity. Sir James Maitland proposes to add to his fishery during the present year a sheet of water 70 acres in extent, to rear fish for the market. The agricultural value of the land at present is about £2 an acre; as a fish pond, from £60 to £70 per acre may be realised. This lakelet will be placed close by the tails of the ponds, and will be capable every season of rearing thousands of marketable fish, which will be sent there, as far as possible, alive. When this project has been completed, a sum of not less than £50,000 will have been expended on the Howietoun fishery.—*Edin.burgh Courier*.

ALHAMBRA THEATRE ROYAL.—On Monday last was produced, for the first time in England, "Jeanne, Jeannette, and Jeanneton," grand opera comique, in a prologue and three acts, by MM. Clairville and Delacour, music by P. Lacombe, the English libretto by R. Reece; characters by Mesdames Constance Loseby, St. Quinten, Alice May, Ivanova, Jamieson, San Martino, &c.; and Messrs. W. H. Woodfield, Fred Leslie, W. S. Penley, Kelleher, Power, Collini, Sweetman, &c. In Act II. is introduced a grand mythological ballet, entitled "Endymion," music by G. Jacobi, in which Mdle. Palladino will make her first appearance at this theatre, in addition to Mdle. Pertoldi and Mdle. Th. de Gilbert, supported by Mdle. Rosa and the entire corps de ballet. Maitre-de-ballet and stage-manager, Mons. Bertrand. The success of the opera was most decided.

GEORGE JAMES EATON, of Starkholmes Matlock-Bath, Derbyshire, respectfully invites Noblemen and Gentlemen to try his standard FLIES for the present season. No flies sent or made up but what he himself has proved sure killers. A trial is all that is required from gentlemen who can fish to prove whether they may be genuine or not. Patronised by some of the best fishermen of the day. All flies dressed on the best Kendal hooks. Prices: Point Flies, 2s. 6d. per Dozen; Dropper Flies, 2s. per Dozen. Orders punctually attended to.—[ADVT.]

NOTICES OF BOOKS, TACKLE, &c.

MESSRS. J. WARNER AND SONS, wholesale manufacturers only, of Hewell Works, Ridditch. Their goods are sold by all tackle dealers, and at the Midland Counties Angling Repository, 121 and 122, Broad Street, Birmingham.

MESSRS. J. WARNER and SONS have sent us some flies for notice, and also some of their patent needle-eyed hooks and their new illustrated price list.

The flies sent are three shades of the invincible blue upright, with one shade of which, the lightest hackle, we had first-class sport last spring. We can most strongly recommend these three shades of the upright to all fly-fishers who fish rapid streams in any part of the kingdom—they will kill, if anything will. They are very neatly tied and will stand an immense amount of wear. We caught over thirty trout with the same fly of Messrs. Warner's, and it killed even better at last than at first.

We have never actually tried the needle-eyed hooks, but they seem to us to be better, because neater, than any other kind of eyed-hook we know. We would recommend Messrs. Warner to send a printed note of directions for fastening on the gut (which is done by a knot). The hooks are of the finest steel and a good shape, they are well worth a good trial from practical anglers. They are well spoken of by Greville Fennell, H. Wade, and other first-class authorities.

Messrs. Warner's illustrated catalogue and price list is quite a splendid affair, consisting of many hundreds of beautifully drawn and coloured illustrations of every conceivable form of fishing apparatus and tackle. It is for wholesale purposes only, and a glance over it amply proves how deep and widespread the love of angling must be. The illustrations are on stone, or we should much like to have borrowed some to print in this paper, as they are so well drawn.

MESSRS. F. T. WILLIAMS AND CO., FISHING TACKLE MAKERS, OF 10, GREAT QUEEN STREET, LINCOLN'S INN FIELDS, LONDON, send their new catalogue of prices, which also contains much information useful to anglers. We can speak from long personal acquaintance most highly of the goods supplied by Messrs. Williams and Co., and their moderate cost. They have several specialties, and any of our friends who have not been there will find it well worth while to look at their stock of artificial minnows, flies, fly-rods, &c. Their guinea fly-rod is a splendid article. We bought one many years ago, and never had a better. Unfortunately a friend—a novice—completely spoilt it by straining the wood in attempting to get the joints apart when wet. It is the greatest mistake in the world to get a friend to catch hold of one joint and then twist the joints apart. It strains the wood, and the rod soon gets limp and out of shape. In taking a rod apart the ferrules only should be grasped, and if this hold is insufficient a little heat will soon put matters straight. A lighted wax match held under the metal is sufficient to heat it and start the moisture.

A LADY'S OR BROOK FLY-ROD.

Speaking of rods reminds us that we have not noticed a most beautiful little rod, which Messrs. Williams and Co. make, and of which they have sent us a specimen. It is in three joints, about nine feet long, and weighs only eight ounces. It is just the very thing for a lady, or for whipping udder bushes on a narrow trout-stream. Its price is very moderate, and it is made of thoroughly-seasoned greenheart, the best wood now in the market for making rods of. Hickory is not to be had—worth having.

MR. JAMES GREGORY, OF VYSE STREET, BIRMINGHAM, is one of the neatest and best makers of artificial baits in this country, and therefore, in the world; and he is always devising something new. His last is what he calls the "Wheeldon Salmon and Trout Bait." It is a beautifully-made metal bait, made to spin on the "Archimedean" principle. We should prefer a darker colour for the back than gold, as we have frequently found these very brilliant spinning baits not half so deadly as more "quietly" coloured ones. A dark brown or blue back, and white belly, is the nearest approach to the colour of the natural bait, and it is impossible to improve on *that*. For beauty of finish Mr. Gregory's baits are unsurpassed.

DEATH OF MR. HARRY WIX.

OUR Lea fishing friends will be very sorry to hear of the death of the veteran roach-fisher of the Lea. Henry Wix was born in the year 1804, and was the son of the Rev. Samuel Wix, who was the Rector of Inworth, Essex, and Vicar of St. Bartholomew-the-Less, London. Mr. Wix served his apprenticeship with the Messrs. Rivingtons, of St. Paul's Churchyard; and afterwards commenced business on his own account as a bookseller and publisher, in New Bridge Street, Blackfriars, where he published several valuable works. He took an active part in the establishment of the Booksellers' Provident Institution, and acted for twelve years as one of its directors. He also advocated the shortening of the hours devoted to business; and formed one of a deputation to wait upon the leading booksellers and publishers, with the view of inducing them to close their establishments at an earlier hour, so that the young men employed might have greater opportunities for self-improvement. His house being required for the extension of the premises of the London, Chatham, and Dover Railway, he retired from business altogether. Being a member of the Stationers' Company, he has latterly for some years been upon the Court of the Company. He died at his residence, Clay-hill House, Walthamstow, on March 27, 1881.—*Publishers' Circular*.

NOVEL USE OF THE TELEPHONE.

L'Electricité states that M. Dohrn has introduced the telephone in connection with his scientific explorations of the bed of the Bay of Naples. By its use the diver and the boatmen overhead are able to communicate with each other quickly and intelligibly, a hint which might be taken advantage of by British divers.

SPRING-FED POOLS.—I was walking with a friend a few years since in some meadows to the north of London, when seeing some small permanent pools of water (fed from springs, most likely), the question was asked as to whether fish would be found therein? Not long after we took a small meshed bait-net, and, to our great surprise, out came several small carp, bright in the scale, and in good condition. This was repeated at another pool, with the same result. My friend returned most of the fish to the water, but took home a couple or so and placed them in an improvised aquarium. We tried some water where we had often seen water efts (male) and newts (female). No carp were here, although several of the former creatures were brought to bank. Now, are these little carp indigenous (so to speak) to these spring-pools, or were they dropped there by herons or other water-birds? No such fish are to be found in the New River, but it is just possible that the "ancestors" of these carp might have been placed in the pools in Queen Elizabeth's time, when a great portion of the north of London was covered more or less with woods, and where the great "Virgin Queen" hawked and hunted.

THE HERO OF THE "GREAT JACK" OF NEWBURY.—Mr. Thomas Newton, a cheery angler, and otherwise very popular with all classes in Newbury, has unfortunately had a paralytic stroke. Mr. Newton caught the big pike that weighed close upon 26 lb., baiting with a live roach of 2 lb. weight. This bait, singular to note, was uninjured—the rush of sharky driving the roach up the gut or gimp. An attendant got into the water to help out the big fish. The capture was made in Sandleford Priory Lake, belonging to Mr. W. Chatteris, and an extra-parochial district in the borough of Newbury.—SPOTS.

A FISH "STICK."—People in the West of England seldom sit down to breakfast or tea without a bit of fish. They procure a holly "fork," or limb with the forks left upon it, on which they hang small dabs, or joey whiting, or other cheap fish, over which they throw some salt, and cook a fish as it is wanted. If any readers of the FISHING GAZETTE should go to the west—say to Dartmouth or Slapton Sands, let them try the clotted cream, and if possible the Dittisham plum-jam. Neither will be soon forgotten.—F. H.

CORRESPONDENCE.

[We do not hold ourselves responsible for opinions expressed by our Correspondents.]

THEORY OF ARTIFICIAL FLIES.

SIR,—When I read "Blue Dun's" first communication on this matter, I felt a great inclination to reply to him, yet I thought it would be unprofitable, and a waste of time explaining one's knowledge and experience to one who seems to be fast wedded to Pennell's theory of "three flies" for all practical purposes.

I and others who have for thirty or forty years toiled with the rod, and studied the natural history of the many flies trout are partial to, whether land or water bred, their particular seasons, their colour, shape and make up, and the times they are in greatest request—whether morning, noon, or evening—don't care a fig for Pennell's or "Blue Dun's" theoretical stuff. If we chose to select three or even four flies of general merit to fish with exclusively through the season, we could easily do so; but would they satisfy us? I rather think not. We will suppose I have been fishing almost every day since the opening of the season, and it is now say May, and I suddenly resolve to adopt Pennell's theory of three flies, and select them accordingly; the trout are not stirring, but I cast away, of course. Presently a warm drizzling rain sets in, and I know, from study and practical observation, that it is about the time for a certain little fly to be on, or must make its appearance at any hour, and I keep a sharp look out. The fish are beginning to "tumble up," but not at my three "chosen ones," and I stop and scan the water carefully, for the fly I am looking for is a minute little object, with pale blue upright wings and dumpy pea-green body. Yet there he is to a certainty—the little green cowler fly. My heart gives a thump, for I know what is in store for me. "Lucky!" I have the fly dressed (if I had not I could have planted myself in a sheltered corner and dressed it in a few minutes, and this accomplishment has often rewarded me with a creel full of fish, which the "theory flies" would not have brought me), on a No. 00 hook, pale pea-green silk, and smallest feather from the sea swallow's wing dressed hacklewise, and I never think it a "great trouble" to change a fly, especially when it's an uncertainty for a certainty; for look you, sir, trouty is now dancing and "coming home" fast and furious. This is one instance out of many which occur through the season, and to my thinking the only effect which "Blue Dun's" argument can have will be a pernicious one for all young aspirants to the art, for, if persevered in, it can only end in disappointment and disgust. The system of the "three-fly theory" is only adapted to the cockney sportsman, who can't be "troubled" with changing his fly to something, he is too lazy to learn what. Gutting a trout to find out what he's had for breakfast, would be too "dirty a job" for him; whereas, were I to meet with a man engaged in such an operation, I should pal in with him at once, as a man after my own heart. See him poising on the point of his penknife the "greatly disfigured" atom from amongst the "dirty job" lot in the trout's stomach. Disfigured it may be, and crushed and minus legs and wings; but he knows what it means, his mind is made up, and if he has not its representative ready made, he's got the materials at hand, and the "colour won't die out" before it has earned its just reward. Of course, that man don't angle in kid gloves—such people are better at home with their mother and sisters, if only to save them from catching cold.

In conclusion, I would advise "Blue Dun" to carry out his theory to the end of the season, and keep the result a profound secret, otherwise I think he will find if he sums up that he might with propriety transpose his *nom de plume*, and write himself "Dun Blue."—I am, &c.,

J. F. HORSLEY.

Southport, March 15.

SIR,—"Blue Dun," in his reply to my former letter on the above subject, characterises my argument as "a courteous one," and I am very glad to think that he feels that my remarks were made in no unfriendly spirit, but that I wrote what I did simply from a wish to represent that vast body of anglers who believe in the other side of the question, who follow nature as their pattern, and who are guided entirely by the seasons, and the flies that are upon the stream. There was once a time, many years ago, when I held the same opinions as he does, but I was not long in discovering my error, and every season that now passes serves to convince me more and more that the only reliable way of taking fish with the artificial fly is to match the flies that you are using with the living ones upon the water, and not only that, but your imitations must be as perfect in size and colour as it is possible to make them.

It is an old saying, but none the less true, that "if a thing is worth doing at all it is worth doing well," consequently I argue that, if it is necessary to imitate a fly at all, that fly must be a more deadly agent if dressed exact to nature; in fact those two essential points, viz., colour and size, form the very keynote of the art of fly-fishing, for, however neatly dressed a fly may be, unless it be the exact shape and the exact size of the fly upon the water, it will be found next to useless. Ask any noted professional fly-dresser, say Mr. Eaton, of Starkholmes; Mr. Ogden, of Cheltenham, Mr. D. Foster, of Ashbourne, or Mr. Cummins, of Bishop Auckland, whether I am correct in this assertion or not, and I will guarantee that their answers will be "yes" in each case. I name these four because I know them all to be thoroughly practical fishermen, and therefore competent judges. Our worthy Editor's opinion I am already acquainted with, and therefore do not include his name.

"Blue Dun" goes on to say that, although my argument sounds well in theory, I must admit that artificial flies are only imperfect imitations of the real insect. To this I reply that I am not content with theory, but base my remarks on actual practice, and have found, during an experience extending over fifty years, in which I have devoted the whole of my spare time to fishing, mainly with artificial fly and almost exclusively for trout and grayling, that, by adhering closely to nature and using imitations of the very flies that the fish are feeding upon, you kill about three fish to every one that you take fishing haphazard. I do not mean to say for a moment that a man cannot kill fish by following out "Blue Dun's" theory, but I do most emphatically say that the other plan answers the best; so that, although he and his friend killed a good dish on the day that he names, he does not know whether he might not have doubled his take if he had only taken the pains to discover what the small fly was that the fish really were feeding upon.

Now as regards "trouble." I consider that such a word should be unknown to the "born fisherman," and when I tell "Blue Dun" that frequently, during the summer months I rise at 4 o'clock a.m., in order to catch the 5 o'clock train, travel thirty miles, and then walk another seven before I reach my water, wade all day against a strong current, and return home the same night,

he will be able to understand that "trouble" never enters my mind, where a day's fly-fishing is concerned.

With regard to examining the contents of a fish's stomach, it is not nearly so dirty an operation as "Blue Dun" seems to think, but often proves exceedingly interesting; a basin of water, or failing that the hollow in a rock filled from the river, and a small pair of scissors, is all that is needed. You cut your fish open, turn the contents of its stomach into the water, and when thus diluted it is easy to distinguish the various flies, larva, or beetles that have been recently swallowed. I have sometimes taken from a trout's stomach a solid mass of flies larger than a wood pigeon's egg.

Sometimes, as "Blue Dun" remarks, you cannot discern any flies upon the surface of the water. When this is the case, you must use your own judgment, and most likely you will discover that it is some water-bred fly that the fish are taking, such as the water cricket, the sand fly, or the spider fly.

I will just mention another proof which I consider a most conclusive one. We will suppose that you are starting for a day's fly-fishing, say in April or May, then put on your cast a March brown, a blue dun, and a red spinner, you will find that the fish will show the preference to the first-named flies, which are in the habit of frequenting the streams in the daytime, but as the afternoon wanes and evening advances you will see the browns and duns gradually disappear, and in their stead comes the beautiful transformation of the blue dun and the red spinner. Now you will find that the flies that have yielded you good sport in the daytime are almost wholly neglected, and the imitation of the new comer will be prime favourite. Now I would ask "Blue Dun" why this should be, if the fish cannot distinguish the difference. Let him just try this simple experiment during the coming season, and I think that he will find my words correct, not only as regards this fly, but also with the yellow dun, and its imago, the brown spinner, the iron-blue dun, and its imago, the Jenny spinner. In a case of this kind I immediately take off the other flies, mount three different shades of the respective spinners (in order to hit the right colour), and usually great has been my reward.

And lastly, as the Editor so truly remarks in his footnote to my former letter, what would become of those pleasant chats around the cosy fire, when drawn together by that mystic bond of union so characteristic of true anglers, you compare notes with your neighbour, and pulling out your fly books you show each other the different patterns of flies, all of which have some tale of their own to tell? A man once remarked to me on one of these occasions, "I should think that you would not take a sovereign for that book." "I would not take ten," I replied—not so much for its intrinsic value, but on account of the memories treasured up in it.

In conclusion, I can only say that "Blue Dun" has as much right to possess a theory of his own as I have—and he may be, for anything that I know to the contrary, both an older and a more experienced angler than myself—still, I must acknowledge that I hold totally opposite views to his, that they are based on experience derived from facts only and that "facts are stubborn things.—I am, &c.,

FRANCIS M. WALBRAN.

"THE FISHERMAN'S MAGAZINE."

SIR,—In answer to your correspondent, "Blue Dun," I beg to inform him that a magazine called "The Fisherman's Magazine and Review" was published monthly in 1864-5, at 1s. 6d. each, by Messrs. Chapman and Hall, London, and was edited by Cholmondeley Pennell; but was discontinued after reaching the second volume. It is to be regretted, as it contained a deal of valuable information for the angler, as well as pleasant day chit-chat; besides, the plates were executed in gold and silver. The first twelve numbers I shall be happy to show any angling friend calling at the Free Library.—I am, &c.,

CHARLES LINGS.

Leicester, March 28.

TROUT-FISHING NEAR GODALMING.

SIR,—I should be much obliged for information whether there is any good trout fishing near Godalming or Guildford, and if the water is free or available by subscription for the day. If not there, where could I go for a day's fishing on Easter Monday within forty miles of London that would not be greatly crowded?—I am, &c.,

T. A. W.

[We should advise Winchester; but Easter Monday is a bad day for getting quiet fishing anywhere.—ED.]

THE THAMES MUST BE FREE!

SIR,—Last summer an angler, while fishing from a punt in the upper Thames, near the residence of a well-known baronet, was interfered with, if not rudely insulted, by stones being thrown into the water close to where he was peacefully trying his lures. I forget whether these stones were actually thrown by a lady who is now in Africa, but at all events, a sort of complaint was written to the *Field* that anglers would fish in the said part of the river; but the editor of the journal in question most unhesitatingly declared that the angler had a perfect right to fish at the spot indicated, or anywhere else in the Thames. Bravo, Mr. Francis! Stick to your text!

Another person—or, at least, another landowner—has, it seems, set up an exclusive right of fishing in a certain part of the river. It was therefore high time that these pretentious claims should be settled once and for all; and it was with this object that Mr. Francis Francis, Mr. Brougham, and others sought an interview with the Finance Committee of the Corporation at the Guildhall. I believe few anglers need be uneasy as to the ultimate issue of the steps being taken to search the ancient charters of the City of London.

The River Thames forms the great heritage of all anglers. The village lad, who hardly dares even to look over the parish bridge at the spotted "fly-catchers" at home, will most likely, in time, add another unit to the Great City. He will then fear no magnate, nor magistrate either, so long as he does his duty well and truly. But he will most likely take to angling—in the Thames especially. That the "Thames must be Free" there is no manner of question. These are days of liberal concessions to the noble army of anglers—not of attempted repression. It would, indeed, be a pretty business if every landowner on either side of the Thames set up an assertion of "private rights" of fishing where his land was bounded by our river, to the detriment of everybody else. No. Such a claim will never be set up by His Grace the Duke of Westminster for his beautiful Cliveden property; nor by the young Squire Grenfell for his Taplow estate; nor by the head of the ancient Roman Catholic family of Scott-Murray, at Marlow; nor by the equally historic family of the Catholic Blounts, of Mapledurham; nor by the wealthy Crawshays, of Caversham Park; nor by Mr. Palmer, of Holme Park, Sonning—among many other

higher and lower resident landowners on either side of our beloved Thames, from its very source to the tideway at Teddington.

The Corporation of the City of London is all-powerful in protecting the people's ancient rights. The Corporation wrested that splendid heritage—Epping Forest—from the rapacity of the Essex "land grabbers," and gave back to the people what really was their own, for ever! The Corporation of the City of London in its municipal capacity will in like manner protect and defend the rights of the people, especially of all its many thousands of anglers in fishing everywhere and anywhere in the Thames, for ever, without asking any man's leave. And no matter what these alleged "private rights" may be, they cannot and must not, by any figment of a bold or reckless conveyancing attorney, be allowed to over-ride the ancient public rights. As the mist of the valley disappears before the morning sun, so, I make bold to predict, will these "private rights" the dissipated once and for all.—I am, &c.,

AN OLD ANGLER.

WHO MAKES SILVER CUPS FOR CLUB PRIZES?

SIR,—Could you oblige me by letting me know where I could get a silver cup to give as a prize to our No. 5 Angling Lodge Society?—I am, &c.,

Neptune Hotel, Blackburn.

JOHN HARGREAVES.

[Perhaps some club secretary will kindly answer this.—ED]

FISHING AT TUNBRIDGE WELLS.

SIR,—Can any reader of the *FISHING GAZETTE* kindly inform me whether there is any fishing to be had at or near the above town; not particular as to sort, but should prefer pike.—I am, &c.,

THAMES SPINNERAL.

FISHING AT LANCASTER.

SIR,—Can any of your readers kindly give me any particulars of fishing in the rivers in the vicinity of Lancaster?—I am, &c.,

VORTEX.

FLY-FISHING FOR ROACH.

SIR,—I have great pleasure in giving your correspondent, "Caxton," a few hints in natural fly-fishing for roach. The common house-fly is best, or yellow cowdung fly, if the house-fly cannot be got. The best time is June and July, in which months roach swarm in mid-water. A small shot on the line is best, so that the fly sinks an inch or two below the surface under trees or bushes, in about three or four feet of water. I have taken roach with the house-fly on the bottom when they would not take any other bait. The roach has a very quiet way of taking a fly; he does not dash at it like a dace, and he has not the caution of the chub. I have taken rudd with the same bait in still water, and in rivers on the surface and on the bottom.—I am, &c.,

CAS.

FOSTER FUND.

I beg to acknowledge with thanks receipt of the following subscriptions towards the above fund:—Penge, 10s.; Hampstead, 16s. 3d.; United Brothers, 7s.; Hammersmith United, 17s.; Mrs. S. Williams (fishing tackle manufacture), 10s.; Thos. Spreckley, Esq., 5s.; Stepney, 6s.; Cobden, 3s. 6d.; the Duke of Norfolk A.S. 10s. 6d. Secretaries are respectfully requested to send in their lists at once to Mr. Ghurney or myself.—T. HOOLE, hon. sec.

THE MUNDELLA ACT.

SIR,—There are many more anglers of the same opinion as "Shut Out," who think the Mundella Act an annoying farce; but if anything is said against the Act you are to think the angling clubs were the cause of it. I am a Thames angler, and belong to an angling club held in a well-known town ten miles from London, on the banks of the Thames. That club had a match on March 13th. The fish that were weighed-in consisted of barbel, bream, dace, jack, perch, and chub. All these fish were as full of spawn as they could hold. There happened to be a large meeting that night, and all the members present were of the opinion that we ought to have back the old fence months—from 1st March to 1st June for all freshwater fish except trout and jack fish; for trout from 1st April to 1st September, and commence jack-fishing 1st September, and fish for them right through the winter to the 1st March. I consider the Mundella Act a complete robbery to our rivers, because anglers are allowed to take the fish about a fortnight before spawning time, and deprived of angling when no harm could be done. It wants a combination of anglers to submit their views to the Home Secretary, for him to bring the matter before Her Majesty in Council, to have it altered. Let us hope something will be done before another season.—I am yours, &c.,

H. E. G.

CLUB REPORTS.

ANCHOR AND HOPE ANGLING SOCIETY.

The next Central return visit will take place on Tuesday, April 5, at the Anchor and Hope, William the Fourth, Canal Bridge, Old Kent Road.—A. SHAKEL, sec.
March 28.

CITY OF LONDON ANGLING SOCIETY.

Our return visit (Eastern District) took place on Tuesday evening, 22nd ult., our large room being well filled with company, Mr. Fowler, of the Sir Hugh Myddleton, in the chair, faced by Mr. Barr, of the Little Independent, Mr. Dudmarsh pianist. We had some excellent harmony by the following gentlemen:—Messrs. Fowler, Barr, Parkins, Langdon, Bonvoisin (recitation), Latch, Wells, Muddiman, Jennings, Head, Small, Plumstead, jun., Shearman, Scarrott, Hyde, Dear, Boyle, G. Oram, and Sparrow. At the roll-call the following clubs were represented:—Amicable Brothers, Alliance, Amicable Waltonians, Hoxton Brothers, Reform, Convivial, North-Eastern, Alexandra, West Central, Norton Folgate, Hearts of Oak, Eustonian, Little Independent, Sir Hugh Myddleton, and City of London. Also the following clubs not on the Eastern District list:—Anchor and Hope, Bostonian, Bridgewater Brothers, Cadogan, Clerkenwell Piscatorial, Duke of Norfolk, Knights of Knightsbridge,

North-Western, and Westbourne Park Piscatorial's—twenty-four in all; also Messrs. Ghurney, Bonvoisin, and Stebbings, representing the three associations. After the roll Mr. Ghurney made an earnest appeal to the anglers present on behalf of the widow and family of the late George Foster, recalling to the memory of some of our old members the doings of bygone years, when they, in conjunction with Foster, met in our present club-room to form the City of London Society. He spoke of the many good qualities of the man, and the share he took in the work of obtaining the privileges which all club anglers now enjoy. He urged them to contribute their mite for the widow as a small recompense for his past services. Mr. G. Oram, bailiff of the Lea, was present, followed by his four-footed assistant. He gave us some interesting facts relating to netting. Let us hope his efforts to prevent it will be successful. We thank our brother anglers who attended, and will return their visits at the first opportunity. The next will go to the Sir Hugh Myddleton.—CAS.

THE GRESHAM ANGLING SOCIETY.

A meeting was held on Friday evening last, at the City of London Larder, 19, Throgmorton Street, Bank, E.C., in order to form an angling society, which it was resolved should be called "The Gresham," and which was designed to meet the wants of City and professional gentlemen. The room was crowded, and the greatest interest evinced in the proceedings, several eminent piscatorial authorities being present. Mr. T. Crumplen was voted to the chair, and was supported by Messrs. George Austin, J. Aveling, G. Bennett, C. T. Beattley, T. Cooper, S. C. Harding, W. J. Haye, J. Thompson, &c. Mr. G. Austin having read the minutes of two previous meetings, the chairman remarked that these gave a good indication of the purpose and objects of the society. They might briefly be stated to be for congenial social intercourse, the dissemination of useful knowledge, the promotion of a higher standard of angling than commonly prevails, the society encouraging the taking of large fish, rather than the competitions for gross weights, the latter being an sportsmanlike system, detrimental to the true interests of the honest angler. They also contemplated renting water and offering numerous facilities only to be obtained by mutual combination. At the close of the proceedings, Mr. Alfred Jardine, who had previously offered several welcome suggestions, and wished success to "The Gresham," proposed a hearty vote of thanks to the chairman, remarking that he was clearly the right man in the right place, and that if the society's business were always conducted as it had been begun, it would soon rank as one of the first in London. A large number of gentlemen handed in their cards and joined the society, Mr. Jardine and other well-known anglers being among them.

HAMMERSMITH UNITED.

Our district visit will take place at the club house, Builders' Arms, Bridge Road, Hammersmith, on Thursday, 7th of April, when we hope to have a good muster, as every angler is cordially invited, whether in the district or not. We trust the landlords of the various club houses will take the hint given by Mr. Bonvoisin, in the FISHING GAZETTE, last week. The Builders' Arms is within two minutes' walk of the three Hammersmith Stations, from whence trains run every few minutes to Richmond, Westbourne Park, Battersea, Clapham Junction, Mansion House, Moorgate Street, Victoria, Waterloo, &c.

—VORTEX.
March 28.

SILVER TROUT ANGLING CLUB.

This society ranks amongst the oldest angling clubs in London, and time has added strength to its operations. The number of members are on the increase, and the funds are in a most satisfactory condition. In its establishment the late Mr. F. T. Williams was one of its chief originators, and the fishing-tackle establishment carried on by his widow bears the designation of "The Silver Trout." It is no wonder, then, that its annual dinner is always looked forward to with no ordinary interest. This event took place on Tuesday evening last, in the club-room, Star and Garter Hotel, St. Martin's Lane, Charing Cross, and very pretty it appeared on that occasion. The walls were well covered with a splendid collection of stuffed specimens of fish, and the tables were tastefully laid out with some choice floral embellishments and other ornaments. The presidential chair was worthily occupied by Mr. Edward Hawkins, one of its oldest members, and who looked exceedingly happy on the festive occasion. He was supported on his right by Mr. W. H. Brougham, and on the left by Mr. J. P. Wheelton. In other parts of the room were Messrs. J. H. Stead, W. Randall, A. Allison, W. Griffiths, J. Butler, Pike, Upton, Grace, Collins, &c. When all were comfortably seated, the worthy host, Mr. F. C. Hatfield, entered the room carrying a magnificent salmon of 25 lb. weight, followed by a splendid cod-fish, both of which he served up to the guests in first-rate style, then came some prime roast beef and a beautiful boiled leg of mutton. These were succeeded by a nicely-flavoured boiled ham and some capital veal, rich plum-puddings, all on fire, and other sweets, with a choice Gorgonzola cheese, made up a superb dinner, the service of which, under the direction of Mr. Hatfield, was perfection, and the cooking by Mrs. Hatfield was deserving of the highest commendation. There could be few diners more thoroughly enjoyed and more highly appreciated. The catering of Mr. F. C. Hatfield has become thoroughly established. After grace had been said, the chairman gave usual loyal toast, and then called upon the company to drink "Success to the Silver Trout Angling Club," which, he said, was in every way prosperous. This was succeeded by a report from the indefatigable secretary, Mr. W. Griffith, which stated that the first prize for gross weights had been won by Mr. Grace, and the second prize by himself. Mr. Holman took a prize for the heaviest pike, Mr. Davis for bream, and Mr. Edwards for chub. The prizes given by Messrs. Hawkins, Davis, Roebuck, Lake, Holman, Dumenil, and Windeye, had been won by Messrs. Grace, Edwards, Davis, Dumenil, Griffiths, Holman, and Lake. Mr. J. H. Stead, who as a singer, is "the perfect cure," and as an angler is one of the best, gave "Success to the Thames Angling Preservation Society," and spoke on its merits, making special allusion to the recent addition of one ton of fish to the river, concluding by coupling the name of Mr. W. H. Brougham, whom all anglers held in the highest esteem. Mr. W. H. Brougham, after speaking on Thames preservation, the necessity of maintaining a stock in the river, and the proposed revision of the bye-laws, recognised the assistance he had always received from the Silver Trout Angling Club, and especially at the time when he first took up the movement of preventing the slaughter of unsizable fish. He believed that club was the first to adopt the Thames rules, and he should always prize and value the society for that assistance. They could not be in better quarters than where they were, but that they all knew, for his friend, Mr. Hatfield, was a thorough angler, and one of the best of men. Other toasts followed, but there was no special toast-list, and when that one came of the "Host and Hostess," it was a scene of

the greatest excitement, each being anxious personally to evidence their sincere regard for Mr. Hatfield. The demonstration was perfect and complete, and the respected host most feelingly replied. There was some splendid harmony, in which both Mr. J. H. Stead and Mr. W. Randall took great prominence, and were rapturously applauded, the other vocalists coming in for a due share of honours. It was a most enjoyable evening. There was no hitch of any kind, and on leaving Mrs. F. T. Williams and Mrs. Hatfield's sister assisted the guests in putting on their overcoats, which were greatly needed on a bitter cold night; and with such union of effort on the part of all at the hostelry, the whole proceedings were highly satisfactory.—B.

The small sturgeon which was caught in angling with a worm at Charlton, near Woolwich, in June last, by Mr. Thomas Howlett, a member of the Woolwich Piscatorials, has been preserved, and is now on view at Mr. Hatfield's, Star and Garter Hotel, St. Martin's Lane, Charing Cross. It measured only 9 inches from the eye to the end of the tail.

THE STANLEY ANGLERS.

I have much pleasure in sending you a very good report from the Stanley Anglers on the finish-up of their fishing and financial season. The last week in the season we had some capital shows of fish—amongst them two shows of very fine roach by Mr. J. Duncan, and weighing respectively 20 lb. 2½ oz. and 25 lb. 9½ oz.; and amongst them 13 roach, averaging 1 lb. each; also a show of the above fish by Mr. C. Scull, weighing 32 lb. 2 oz., which were very nice fish, though not up to the average weight of Mr. Duncan's fish. I may mention that Mr. Scull is one of our very best roach fishermen. We also had very nice shows from Mr. J. Thompson, Mr. T. W. Harris, and Mr. R. Humby. The total weight of fish shown in by the members of the society for the past season amounts to 1031 lb. 9½ oz., out of which our worthy president, Mr. C. R. Wheatstone, shows in 334 lb. 11 oz.—but, still, he has fallen very much below his regular season's average, as have also several members, and likewise the collective gross weight. I suppose it is a general complaint with most societies, and can easily be accounted for when we look back to the unfavourable fishing weather we have had. I am very pleased, however, to inform you that our financial year has been a success, as we have got a good balance in hand. Our annual ball took place in the middle of this month, and was—as usual—a great success. As before, it was a private ball, and was conducted on the principle of friendship—in fact, it was more like a family party than anything else. Over 100 sat down to supper, and everything passed off satisfactorily. Mr. Jarvis, our president, was a very successful caterer—Mr. Johnson, as usual, showing his superior abilities as M.C., and Mr. F. Roberts supplying us with a first-class band. Great credit is due to the stewards, viz., Messrs. C. R. Wheatstone, T. Godsell, J. Duncan, J. E. Lawford, Gow, Paramor, U. F. Pistrucci, Rix, Thompson, and Lieut.-Col. Crauford, for the manner in which they vied with each other to procure the greatest amount of pleasure for their clients. I must admit that their labours were not arduous, as every one appeared to have made up their mind to thoroughly enjoy themselves—and in which, I am happy to say, they were successful. Apologising for the length of this report, I am, &c.,—C. LAIDLAW, hon. sec.

SURREY PISCATORIALS.

At the general meeting of the members of the above society, held at the St. Paul's, Westminster Road, Walworth, the Rules Revising Committee submitted their revised copy for the approval of the members, who received it with great satisfaction. Among the alterations is that the meeting nights be every second, fourth and fifth Wednesday in the month, and not Thursday, as hitherto. It being the wish of the society to make a collection of the different species of fish, members catching fish of or above the following weight can have them preserved by the society:—Salmon, 10 lb.; Thames trout, 6 lb.; trout, 2 lb.; grayling, 1 lb. 8 oz.; pike, 15 lb.; perch, 2 lb. 8 oz.; barbel, 7 lb.; carp, 5 lb.; crucian carp, 3 lb.; tench, 4 lb.; chub, 4 lb.; roach, 2 lb.; dace, 12 oz.; bream, 5 lb.; rudd, 2 lb. The time allowed for taking fish in this society is according to and agreeable with the Acts of Parliament for the regulation of the same. The minimum weight of each fish permitted by the society is as follows:—Thames trout, 2 lb.; other trout, 8 oz.; Thames grayling, 1 lb.; other grayling, 8 oz.; pike, 2 lb.; perch, 3 oz.; roach, 3 oz.; chub, 12 oz.; barbel, 12 oz.; bream, 12 oz.; tench, 12 oz.; dace, 2 oz.; gudgeon, 1½ oz. The following gentlemen were elected as officers for the season of 1881—82:—Dr. Carpenter, as president; Dr. Maples, as vice-president; Mr. Medway, as chairman; and Mr. Weekly, as vice-chairman. Committee of management, Messrs. Boalch, Duck, Linstead, Murray, Beckett and Pugh. Auditors, Messrs. Boalch and Haywood. Treasurer, Mr. C. Bansbach. The annual dinner will take place on April 27th. Tickets 5s. each, which can be obtained of the stewards, Messrs. Beckett, Boalch, Duck, Linstead and Haywood.—PIXIE.

March 30.

TRAFALGAR ANGLING SOCIETY.

NOTICE.—Members of the above society are requested to attend at their club house on Wednesday next, April the 6th, at 9 o'clock sharp, it being quarterly night, when the distribution of prizes will take place.—R. GAZE, sec.

March 29th.

WALWORTH WALTONIANS.

At the general meeting of the members of the above, held on March 25, it was agreed that all prizes won during the past season should be assessed at 5 per cent., and that the annual dinner takes place on May 11. Mr. Evans, assisted by Mr. S. J. Weatherhead, will preside. Stewards for this occasion are Messrs. Bayley, Piolaine, Fox, Grigg and Sutcliffe, of whom tickets can be obtained. In consequence of the amount of time it would take to distribute the prizes on this occasion, it was unanimously agreed that the distribution be postponed until May 20.—PIXIE.

March 30.

WEST CENTRAL ASSOCIATION OF LONDON AND PROVINCIAL ANGLING SOCIETIES.

NOTICE.

In consequence of the 15th being Good Friday, a special meeting will be held on Friday, April 8th. A circular will be sent to every society enrolled,

secretaries are requested to inform me if they do not receive one. P. Geen, Esq., hon. president, will preside. Election of officers for the coming twelve months and other important business will be brought forward. Delegates are earnestly requested to attend. A new list, containing the names and address of over 120 angling societies in London, will be presented to each society represented.—T. HOOLE, hon. sec.

March 29.

AN EXTRAORDINARY WHITING.—Brixham, South Devon, is perhaps the most important fishing town upon the English coast. A number of whiting were brought in here on Saturday, March 5, and amongst them was one very large and heavy fish. This whiting measured 2 feet 6 inches long, and weighed 6 lb. 2 oz. The Brixham trawlers go to the North Sea, and down to Cornwall at certain times of the year. Of late the fishing interest has been much depressed, with the exception of one week about a month ago, when quantities of best and other fish were landed, and disposed of in Brixham market, the best to go away to large cities, the inferior being sold to local hawkers. No wonder best fish is so dear, when orders from distant places cannot be executed. It was at Brixham where William of Orange landed; and hard-by lived the late Rev. Mr. Lyte, who wrote "Abide With Me," and other beautiful hymns.—RUSTICUS.

Mr. Arthur Norman, of the Bow Brewery, killed a fine pike when at Fritton Lake, near Yarmouth, recently. It was 40 inches long, weighed over 13 lb., and altogether a very handsome fish. Mr. Norman fished with Thames dace, which are no doubt by far the best bait. This splendid water is only just opened for fishing, after being closed for six months during the decoy season. It is nearly three miles long and very deep. The proprietors are Sir Saville Crossley, Bart., and Lieut.-Colonel Leathes, of Herringfleet Hall. Under Mundella's Bill, we should not be allowed to fish until the month of June, but being in Suffolk, we can fish as we please, and they cannot stop us in any way.

TIRED HANDS AND ARMS.—Edson's Electric Armlets and Wrist Bands. Invaluable for anglers and gun sportsmen and highly recommended for all persons having tiresome writing, sewing, or music practice. They give wonderful energy and strength, enabling the wearer to accomplish tedious work with steadiness and comfort. Price 2s. 6d. per pair, silk web and fine steel clasps. Sent to any address on receipt of P.O.O. payable to J. Edson, the Electric Fabric Co. Patentees, No. 1, Charlotte Street, Bedford Square, London W.C.—[ADVT.]

ANGLERS should always be provided with something to take away the swelling and poisonous effect of the bites of insects. They should also have with them something to apply to a cut or sprain. Pond's Extract reduces the swelling and inflammation, stops bleeding and pain, and hastens the healing process in case of any wound or sprain; and it has no equal for application to the bites and stings of insects. Therefore never go on a fishing excursion unprovided with a bottle of Pond's Extract. It is for sale at all chemists, at 2s. 3d., 4s. 6d., and 8s. 6d. per bottle.—[ADVERTISEMENT.]

TO ANGLERS.—W. J. Cummins, Fishing Tackle Maker, Bishop Auckland, is now prepared to forward to anglers his Illustrated Catalogue, which is not only a Trade List but is interspersed with practical hints, useful directions, and valuable information gathered by the river-side from twenty years' experience. The stock consists of his unrivalled Salmon, Trout, Grayling, and Pike Rods, Lines, Reels, Baskets, Artificial Baits, Fly-books, Landing Nets, Gaits, and last, but not least, his celebrated Trout Flies, which for killing powers stand unequalled. Every article kept in stock is of the very best description.—[ADVT.]

THE VALUE OF FOGS.

THE author of "Life in Normandy: Sketches of French Fishing, Farming, Cooking, and Politics, drawn from Nature"—2 vols. p. 800. Edinburgh, 1863—a rare book now unfortunately, shows how a fog may be a great boon to anglers. He was fishing one day in the river Colne with the May-fly when a thick fog came on after a bright morning, with the fish rising well. With the fog fled the fish and flies. He was about to give up in despair, when he saw an old fellow, whom he knew to be a desperate poacher, watching him. He gave him a drink, when the old fellow said, "I can give you a wrinkle that would make you stay by the river." A half-crown was promised. "The fish are feeding just as fast as ever below, and they don't require to rise to the surface. The May-fly be a-coming out of their cases just now as before. When the sun is bright them creturs is up and away in a jiffy; but when the day is dark, one as does come out of his case either crawls up the reeds at the side, or if they do rise in the stream they gets on but slowly, and the fish nabs them afore they reach the surface, as I will soon show you." He thereupon proceeded to collect several flies, which were clustered round the stalks close to the edge of the water. He then arraged the line in this manner: First he took off the flies, and put on in their place two small bait hooks, the one about a foot above the other. Then he took two large split shot out of his own pocket and fastened them on the casting line, three feet above the upper hook. The hooks were baited by running them through the tails of a couple of the May flies, and all was ready. He proceeded to the head of a weir where the stream was very deep, but there was a rush of water through two or three places where the sluice-boards were drawn. He cast the line across one of these small rapids, let it sink for a minute, and then drew it gently towards him through the rush. No sooner had the line reached the rush than there was a fine fish hooked. The author adds that he caught more fish by that method on that day than he ever caught before or since in the same river.—Globe.

ERRATUM.—The writer of the article, "Weight, &c. of Freshwater Fish," in last week's GAZETTE, writes to say that the memory of a good day's sport is always living treasured upon the tablets of the memory—obviously not the "table."

GREGORY'S SPINNING BAITS.—"The Gregory," the "Flexible Cleopatra," the "Oxford," and the "Colorado," pronounced by all Anglers and the Press the best baits invented for salmon, trout, pike, and perch. To be obtained from all respectable fishing-tackle shops in the world, and wholesale from Messrs. S. Allcock and Co., Standard Works, Redditch. Flattering testimonials speaking of the efficiency of the baits have been received from the Right Hon. John Bright, M.P.; Mr. William Bailey, Nottingham; the Rev. E. C. Holt, Teddington; Sir William Calder, Kingston-on-Thames, &c. Gregory's registered Archimedeal spinning tackle for pike and trout, now ready, is pronounced by the press the best ever invented. For use with dead bait. The tackle is complete in every respect, and can be adjusted to suit bait of any size. Has been tried with remarkable success.—See that the name "Gregory" is impressed on the Archimedeal fins, as inferior imitations are offered for sale, and people are thereby disappointed and deceived. Address, James Gregory, Vyse-street, Birmingham.—[ADVT.]

MRS. F. Y. BROCAS, Artificial Fly Dresser, 4, Mill-street, Conduit-street, Hanover-square, London, W. A stock of best flies always on hand. Flies made to-pattern. Lessors in fly making given.—[ADVT.]

FISHING GAZETTE OFFICE, 12 AND 13, FETTER LANE, LONDON.

NOTICE.

Communications relating to the Literary Department, Fishing Tackle for Notice, Books for Review, &c., must be addressed to the Editor of THE FISHING GAZETTE, No. 12, Fetter Lane, London, E.C. and should reach the office not later than Tuesday morning.

Contributions are solicited, but the Editor will not undertake to return rejected MSS., unless accompanied with a stamped addressed envelope.

Correspondents are requested to write on one side of the paper only and give their real names and addresses, not necessarily as signatures to their letters, but as a guarantee of good faith. Unless this rule be adhered to no notice will be taken of such communications.

THE FISHING GAZETTE is published every Saturday, and can be obtained at Messrs. W. H. Smith and Son's Railway Bookstalls, and of the following, amongst other Fishing Tackle Dealers in London and the Provinces:—

Messrs. Alfred and Son, Moorgate-street.
Messrs. Price and Co., 8, Seymour-street, Euston-square, N.W.
Messrs. Williams and Co., Great Queen-street.
Messrs. Gee and Co., St. Andrew's-street, St. Martin's-lane.
Messrs. Gee and Co., Gray's Inn-lane (near Holborn end).
Messrs. Little and Co., Fetter-lane, E.C.
Messrs. C. Kewell and Sons, 197, St. John-street-road, E.C.
Messrs. Kewell and Co., 14, Conduit-street, Regent-street, W.
Mr. J. Richards, 97, Church-street, Paddington.
Mr. W. Leader, 30, Upper Marylebone-street, Portland-place, W.
Mr. — Clark, 35, Wells-street, Camberwell.
Mr. Geo. Read, 91, Goldsmith's-row, Hackney-road, E.
Mr. A. Hulmer, 62, Wandsworth-road.
Mr. F. Oliver, 184, Great College-street, Camden Town.
Mr. J. E. Gold, 284, Waterloo-road.
Mr. D. W. Willoughby, 21, Lombard-market, Battersea, S.W.
Mrs. F. Y. Brocas, 4, Mill-street, Conduit-street, Hanover-square, W.
Messrs. Gillett and Co., 40, Fetter-lane, London.
Mr. Alfred Young, "The Golden Perch," 174B, Oxford-street, W.
Mr. T. Barnett, 26, Church Street, Lisson Grove, N.W.
Mr. J. Smith, 7, Tottenham Court Road, London.
Mr. Edwin Stevens, Newsagent, 22c, Kentish Town Road.

or

Mr. B. R. Barabridge, 74 and 75, High Street, Eton, Bucks.
Mr. Cowan, 33, South Frederick-street, Edinburgh.
Mr. H. Whitty, 15, Basnet-street, Liverpool.
Mr. C. J. Greene, 54, London-street, Norwich.
Mr. R. Ramsbottom, 81, Market-street, Manchester.
Mr. James Gregory, Vyse-street, Birmingham.
Mr. Wm. Bailey, Jun., 29, London-road, Nottingham.
Messrs. Nutting and Co., 70, Edgbaston-street, Birmingham.
Messrs. W. C. and J. Penny, Booksellers, Froome.
Mr. E. Perks, Evesham-street, Redditch.
Mr. J. Walsh, Bookseller, 5, Harpur-street, Bedford.
Messrs. H. and C. Treacher, Booksellers, Brighton.
Messrs. Gaynor and Son, 10, Royal-terrace, Richmond, Surrey.
Messrs. O'Handlen and Co., 48, Victoria and Temple-streets Bristol.
Mr. Wilkes, Gunmaker, Leeds.
Messrs. Cayless and Sons, Midland Tent Works, Loughborough.
Miss G. Wells, 1, Sussex-street, Nottingham.
Mr. Wm. Atkinson, Fishing Tackle Maker, Lancaster and Kendal.
Mr. John Wells, 4, London-road, Nottingham.
Messrs. M. Tchell and Co., 50, Market-street, Manchester.
Mr. J. Croisdale, 56, Brigate, Leeds.
Mr. John Keeling, the Golden Salmon, 7, Digbeth, Birmingham.
Mr. John Heywood, Manchester.
Mr. John Cocks, Baker Street, Weybridge, Surrey.
Mr. Wm. Reid, Northgate, Darlington.
Mr. R. Pearsall, 11, Great Western Arcade, Birmingham.
Mr. G. T. Gibbons, 10, Bridge Street, Salisbury.
Mr. Thos. Heppleston, Manchester.
Mr. J. Perry, Minster Parade, Reading.
Mr. S. Dale, 7, St. John Street, Nottingham.
Mr. H. Booth, 88, Prospect Street, Hull.

Newsvendors can obtain the journal through their London Agents.

The Fishing Gazette.

SATURDAY, APRIL 9, 1881.

FLAM, ON THE DOVE.

By FRANCIS M. WALBRAN.

TO the tourist angler, who wishes to enjoy the beauties of nature, and perhaps indulge in a little sketching or botanising in addition to his favourite sport, few places yield greater

scope for the fulfilment of his desires than Dovedale, that pleasant valley along the bottom of which meanders that crystal stream from which it takes its name, and which every true angler holds sacred to the name of dear old Izaak Walton.

It was approaching the end of September in last year, and I began to think that it was about time for me to spend a few days among the grayling, but could not quite make up my mind where the appointed place should be. I had been on a similar expedition in the previous year to the Derbyshire Wye and Derwent, and had then heard a great deal about the beauties of Dovedale, so after a little further consideration, I decided to go there, and forthwith wrote to Mr. Prince, landlord of the Izaak Walton hotel at Flam, to know whether the river was in proper order. His reply being favourable, I started off on the following Saturday, and after a somewhat tedious journey found myself and belongings on the platform of Ashbourne station on the North Staffordshire line, at 8.30 p.m.

The night was bitterly cold, and as I was aware that a five-mile drive awaited me, from Ashbourne to Flam, my feelings, for the previous half hour, had been the reverse of cheerful; however, my fears were unfounded, for Mr. Prince had thoughtfully sent a neat little closed 'bus to meet me at the station. In this I was soon ensconced, and was being driven to my destination as rapidly as a couple of post horses could take me. The distance was soon accomplished, and the hospitable doors of the Isaac Walton opened to receive me. A comfortable meat supper was in readiness, which soon dispelled the weariness consequent upon my long journey, after which I spent half an hour in the consumption of a drop of the "cratur" and a pipe of reflection, and then to roost.

I was up betimes next morning, eager to see the prospect from my bedroom window, and indeed I was not disappointed, for it was a beautiful one. The hotel is a long, low built building, forming two sides of a square, and is situated at the summit of a lofty hill; from one side of the house you obtain a splendid view of the entrance of Dovedale; two lofty mountains, named respectively Bunster and Thorp Cloud rise abruptly on either side, and I could just catch a glimpse of the winding river flowing between them, and glancing in the rays of the bright morning's sun like a thread of silver. The appearance of the whole scene from this side of the house is wild and rugged in the extreme, but on going round to the other side quite a different aspect meets your eyes. The road from the hotel slopes down to green fields and pastures, through which the more impetuous tributary stream, the Manifold, runs murmuring, joining the main stream about 200 yards from the road. In the extreme distance are waving woods and green hedgerows, while on the right hand you catch a glimpse of the lofty gables and chimneys of Flam Hall, rising above the trees, and nestling at the foot of the hill are the few neat cottages that constitute the village of Flam.

The day being Sunday, of course there was no fishing to be done, so I took a long ramble down stream and prospected the river. For some distance below the confluence of the Manifold and the Dove, and also along a portion of the former, the whole of the fishing is strictly preserved by the Okeover Angling Club, which is a very exclusive one, consisting of a limited number of members. Much I envied those fortunate individuals as I wandered along the banks, for the stream looked perfection from an angler's point of view, and here and there a little dimple in the water marked the spot where some newly-hatched fly was sucked down by the watchful fish. I met the river watcher some distance down the river, and after a long chat with him, *de omnibus rebus*, I returned to the hotel.

Monday morning came at last. Not one of those soft, hazy September days, most welcome to the ardent grayling fisher, but

a cold, uncompromising sort of day, with a dull leaden sky, and a sharp north-east wind, which foreboded anything but good sport. However, about 9 o'clock I sallied forth, descended the hill, crossed a field or two, and was soon on the spot where the Manifold joins the Dove, this being also the place where Mr. Prince's right of fishing commences. The river here is somewhat contracted, and thickly fringed on the banks with willow trees and hazel bushes. My rod was soon together, and wading in under the near side, I started to whip up stream, with no apparent results, however, until I came to a place where a strong stream ran under the near bank, whilst the river widened out at the far side and formed a drinking pool for cattle. Here I saw a good grayling follow my top fly, which was one called locally the "October dun." Twice he came in that gliding way peculiar to this fish, but at his second attempt I pricked him, and, consequently, saw him no more.

After this I fished on for some distance, over some grand looking water, until I came level with the hotel; but beyond basketing a brace of trout, and rising a few more, nothing else did I see. I now approached the entrance of Dovedale proper, and here the angler will find some grand haunts for grayling; quiet eddying streams from two to four feet in depth, and flowing over a combination of loam and sand. I felt certain, as soon as ever I saw the stream, that there must be grayling here, but as I obtained no rises in it, I felt equally certain that unless they changed their mood I was not going to kill many grayling that day; and as the time wore on my expectations were fully verified. A high iron gate guards the entrance to the valley on the hotel side of the river, and just below it is a fall, with a nice pool below. In it I saw a good fish rise, but he laid in dangerous proximity to some submerged thorns; however, I determined to risk it, so after a preliminary cast, just to measure the distance, I let my end fly drop about a foot above him. He came with a regular dash at it and hooked himself; as soon as ever he felt the hook, as I anticipated, he at once made for his fastness under the thorn bush, but I was a trifle too sharp for him; and before he was aware of the fact, had run him down below it. Three or four minutes' sharp play, and he was in my landing net—a beautiful golden trout just under $\frac{3}{4}$ lb. I next fished along a deep piece of water just above the fall and gate alluded to before, and which I was subsequently informed is one of the best bits of grayling water in the river; but on this occasion they were clearly not in the humour, so that beyond a trout or two I got nothing out of it. From this point the surrounding scenery is extremely fine; lofty mountains rise up on either side of the valley, between which the river flows peacefully along, broken here and there by miniature falls, with grand pools below them; then you suddenly come upon a clump of trees forming a small wood, with scattered rocks and boulders interspersed. The bed of the river here is more rocky than it is below, and therefore forms a succession of fine rattling streams, which are perfection for the trout fisher. In order to fish this part of the river properly, the angler will have to wade pretty deeply under the overhanging branches of the trees that line the near bank, casting up stream with a short line. The trout season being almost over, I did not do much myself, but I felt none the less sure of the fish being there. I wandered along, casting here and there, until I fished about $1\frac{1}{2}$ miles up the river; I then began to retrace my steps and had just got in sight of the hotel when suddenly the heavens opened. I quickened my steps at once, but got almost wet through before I could get indoors, my total for the day being $2\frac{1}{2}$ brace of nice trout, but not a single grayling. On looking out of the window next morning, I saw at a glance that there would be no fishing that day, as the wind was blowing a regular tornado down the valley, accompanied by torrents of rain; so there was nothing else for it but

to put a good face on the matter, and, consequently, spent the day in overhauling my fly hooks. The storm continued until about 4 o'clock p.m., when the weather suddenly brightened up, whereupon I donned my mackintosh, and started off to inspect the river. I found it, as I fully expected, in full flood, and felt very doubtful about the morrow; but on my return, Mr. Prince told me that, providing no more rain fell, he thought that the river would be fishable—at all events upon the shallows; so I retired to rest about 10 o'clock hoping against hope.

I awoke early, and was greatly delighted to find the sun shining brightly, so that half an hour only elapsed before I was again on the banks of the stream. It had run down considerably during the night, and the bottom was plainly visible in places here and there; I mounted larger flies than I had previously employed, and by carefully fishing the edges of the streams I soon began to take fish, but not the ones I was in quest of. To-day, however, I was not surprised at this, as grayling invariably rise badly in either a rising or a falling water. The trout, however, made up for them, and soon had a couple of brace of nice bright fish in my basket. About 200 yards or so, perhaps rather more, above the iron gate is a fall, and just above it a small island encompassed by a lagoon of rushes. Throwing a long line between the bottom end of this island and the top of the fall, saw I a wave in the still water, which I suspected was caused by a fish following my flies; accordingly, I struck at once. Whirr! went my reel as a splendid trout of at least $1\frac{1}{2}$ lb. sprang into the air, and before I could determine what was the best course to pursue, away he went over the fall below. I followed him up as quickly as I could, and much to my delight found the line still taut; but, *miserabile dictu*, my top fly had caught on a projecting stone covered with moss, so that the trout, suddenly making another dash, took nearly the whole of my single hair cast and three flies, leaving me to bewail their loss and that of the best fish I had yet seen. I went on hooking and getting trout until I had a nice little dish of $4\frac{1}{2}$ brace, but it was not trout that I had come in search of but grayling; and as they were evidently not inclined to stir, I determined to waste no more of my time, but return to Yorkshire and see whether "Salmo Thymallus" was in a more amiable mood in that county. Accordingly I packed up my belongings, and returned home that same evening.

This was my first visit to the Dove, but I trust not my last, as it certainly is one of the prettiest and most picturesque rivers that I have ever fished. Owing, no doubt, to the clearness of its water and also to the great number of anglers who frequent its banks, the fish are remarkably well educated, and, as we say in Yorkshire, "know a hawk from a hernshaw." It is therefore imperative for the angler to use the finest of casts and the smallest of flies, throwing carefully up stream; but to anyone who can handle a fly-rod at all, I feel certain that a visit to the Dove will prove anything but a disappointment. The scenery alone is well worth a visit, and I was told that in spring it is something lovely; some very rare ferns and wild flowers may then be found by the enthusiastic botanist—in fact, they told me that in some sheltered places lilies of the valley grow wild.

As regards the accommodation, I cannot speak too highly of the manner in which the Izaak Walton is conducted, both Mr. and Mrs. Prince doing everything in their power to render you comfortable and "at home." The attendance throughout is first-rate, the cooking most excellent, the whiskey and cigars of the best brands, and the beds perfection as regards comfort and cleanliness. When I have said this much, I think that I have touched upon all the points likely to interest the angler. With respect to what flies to use, of course, they vary with the months; but I found the orange bumble and red Furness hackles answer the best, used conjointly with the October and the whirling blue dun.

The former were dressed for me by Mr. G. J. Eaton, of Stark-holmes, and the latter by Mr. David Foster, of Ashbourne, both of whom are masters of the art of fly dressing, and are also great authorities for the Derbyshire streams.

Mr. Prince will, I feel sure, be only too glad to furnish any further particulars to any one who may apply to him, and I feel certain that any one who pays him a visit during the coming months of April or May will not regret it, but will in after days treasure up the remembrance of it as being one of the pleasantest excursions in their angling experience.

PIKE-FISHING IN NORFOLK:

TO a lover of the rod, pike-fishing in the winter months is the very essence of exhilarating sport, and here, in the capital of the Eastern Counties, we are exceptionally favoured in the pursuit of this, the river pirate, our splendid broad meres and rivers affording sport worthy the consideration of all lovers of the craft. The early part of the present season was an exceptionally favourable one; never do I remember so many pike in our rivers. In autumn the number killed in the river Yare between Thorpe and Brundall must have been very large, some enthusiastic spinners wandering as far as Cantley and Limpenhoe. Takes of a dozen fish a day were nothing uncommon. The practice of trailing a spoon or any bait behind a boat, albeit not very sportsmanlike, is very destructive, and to those who cannot, from constitutional or other causes, brave the cold winter's fishing, it gives them a chance of sport without fear of ill results from exposure to wintry weather. Any autumn day when the water is in fair condition a number of boats may be seen on the river, with the necessary oarsmen in the fore part, and one or two eager fishermen in the stern, trying hard to catch Mr. Jack, every rodster apparently having an idea of his own as to the method of using his bait. Some simply pay out line and let the bait work with the motion of the craft; others give a succession of jerks, some quick, and again slow, communicating to the bait a peculiar and supposed eccentric motion. The number so caught some days is very large—as many as thirty have been taken by one boat—unfortunately, the fish so caught run small, scores being under two pounds weight. Many of these fish are returned to the river, but more we fear are kept; still there seems no lack of the supply. Now and then may be seen a more advanced member of the craft known by his dead natural bait on a flight of hooks, trying over some likely haunt for the second or third time; the objection is that in autumn the weeds are so much up that a natural bait, although very killing, soon gets damaged. The variety of artificial baits has so increased of late years that the finny tribe must really wonder at some of the peculiar strangers flashing through the water. My own experience has been that the old-fashioned spoon is the most killing of all, and if the water is a little cloudy, a bait with red on the concave part is very enticing. I am not a great advocate for trailing or spooning, and I know some of our metropolitan brethren speak out very strongly on the subject, but I must confess a row over several miles of our beautiful rivers on a fine autumn day is not without its recommendations.

“There is a beautiful spirit breathing now
Its mellow richness on the clustered trees,
And, from a beaker full of richest dyes,
Pouring new glory from the autumn woods,
And dipping in warm light the pillared clouds.
Morn on the mountain, like a summer bird,
Lifts up her purple wing; and in the vales
The gentle wind, a sweet and passionate wooer,
Kisses the blushing leaf, and stirs up life
Within the solemn woods of ash deep crimsoned,
And silver beech, and maple yellow leaved,
Where autumn, like a faint old man, sits down
By the wayside weary.”

In our local rivers in September and October the pike and perch take very freely to artificial baits, and this without any preparation or much effort on the angler's part is often a consideration.

The Fish Preservation Bill as applied to the Eastern Counties is already bearing good fruit, and in a year or two the fishing on our rivers must be very excellent indeed. The many broads we have in connection with our streams render their recuperative powers amazing, and now that illegal netting on the rivers is severely punished and the nets confiscated the most desirable results must follow. Had I been told five years ago that I should sit in a boat at Thorpe snap fishing for pike quite near the city, I should have deemed my informant a madman; yet such has been the case, and I have had excellent sport, too, catching some very good fish, whilst some who had more leisure time than myself have been most successful indeed. Next to salmon or trout we must consider pike the noblest quarry for the fresh-water angler. What a game rascal he is when hungry—or angry! The difference I think is very little; many a small jack I have had run away with my bait, and on coming near the side of the boat shake the unfortunate dace like an angry dog a bone, when obliged to part with it or be drawn out of the water.

The North River or River Bure must not be forgotten here; the scenery between Horstead and Horning is something worth a journey to see. Wroxham divides these villages, with a convenient railway station near the river, so that there are few difficulties to surmount to reach this haunt of the angler, two good river-side inns existing with every accommodation for the lovers of the rod. There is a reach called the Gravel Dyke just past Wroxham Broad, with a hard bottom, and fairly deep; here capital jack and perch are to be found. Immediately past this is a grand stretch of water called the “Black Currant Reach,” from some bushes of that fruit growing wild. This is a beautiful spot; at one side trees grow nearly to the edge of the water, with some bends in the river, forming natural basins, called by the aboriginals “pulsks.” These nature's harbours, if I may call them so, are partly covered with lily pads and other aquatic plants, and afford a rare spawning ground for fish. The other side of the river are rushes and tall reeds, flowering on the top, their stems kissed by the tide as it flows sluggishly by. Commend me to this spot when—

“Autumn bleak and sunburnt do appear
With his gold hand gilding the falling leaf.”

This charming reach of water is a perfect El Dorado to the pike fisher; the river is rather narrow, and in places fairly deep; the paternoster lover, skilled in the manipulation of two lively baits, may get plenty of runs; never have I tried this place with the water in any condition without satisfactory results.

“When Autumn scatters his departing gleams,
Warn'd of approaching winter, gather'd, play
The swallow-people; and tossed wide around,
O'er the curtain sky, in convulsion swift
The feather'd eddy floats, rejoicing once,
Ere to their wintry slumbers they retire.”

The various artificial lures are very killing on this the North River, we natives not giving the fish the credit for the education the finny tribe on the Yare have had. In brown October a row on this stretch of river is worthy of a place in the angler's memory; the change from growth to decay has begun, leaves assume a “russet hue,” and the first high wind that whistles through the trees will bring them down in a plentiful shower. The ruin of the year has commenced in earnest!

“But see, the fading many-color'd woods,
Shade deepening over shade, the country round
Imbrown; a crowded umbrage, dusk and dun,
Of every hue, from wan declining green
To sooty black.”

Passing on to the colder months of mid-winter, when the days

are dark and short, here the pike-fisher, the real veteran of the rod comes to the fore; the autumn fisher has had his sport in fine weather; has seen nature in her calmest moods. Let him not begrudge us our pastime.

"Each season has its special charm, each hour its special grace."

Now for a visit to one of our broads. We get the required permission and send a line to the keeper fixing a date to try our fortune on the water he so jealously guards. But we have a more serious matter before us now; we must be prepared to do battle with the elements, and a day on a large sheet of water without the necessary comforts of clothing and ammunition for the inner man is no joke. We don clothes that give one an idea of incipient suffocation, finishing with a pair of boots strong and water-tight. 'Tis a frosty morning, and a drive of a dozen miles in an "eager and a nipping air" tells us what to expect, but what of that? The air may be frosty—it chills not us, enthusiasm in sport affording such additional zest to its indulgence.

Mr. Leggings meets us at our destination. A most mysterious man is this gentleman of the gaiters, and knows every yard of the broad we purpose to fish and the likely haunts of some of these larger rovers in his waters; he fears, in answer to our enquiry as we row a short distance along the river, that the fine ice formed during the night will be troublesome amongst the reeds; however, we find there has been some wind during the night, and the greater part of the sheet is quite clear. To fit up and get to work does not take long; we are provided with a couple of dozen silvery dace and roach; the bait gleams like silver as it is cast into the most likely spots, attached to a pippin float and a snap hook. Ha! A run! The rapidity with which the float disappears argues well—what a charm there is in the electric-like motion with which it spins away! We give Mr. Jack no law, merely winding quickly up all slack line. I have him, and it is a battle royal between us. Cynics may preach what philosophy they please to me about fishing—let them see a handsome ten-pounder rush to his doom, and if I do not make a convert I have lost my faith in all mankind. What mighty struggles he makes for life and liberty! This is sport! Compared to which trailing—but no, that sportsman has had his share of good things; let us enjoy life while we can and fishing while we may. Steady, my friend Leggings, with the net! You are too impetuous for a stolid man of nearly three-score; We have him at last! How he fixes me with his eye as I unfasten the hook off the swivel; Mr. Leggings gives him what he calls a knap on the head with a short stick, and his troubles are at an end. But we must not stop to moralise. The winter's day wears on; a pull at the flask filled with whisky distilled in the land of the thistle, and once more we are fitted up, and with varying success pursue our efforts in search of sport till the welcome idea comes that luncheon would not be amiss. We run our craft into a likely spot in the reeds, and change our snap for a gorge bait; quickly our substantial viands disappear, and friend Leggings buries his face in the mug, after which he visibly relaxes, and sagely remarks that a drop of good ale "is very comforting like." Quick to work again; the day is short, and already the little sun there is begins to sink behind the clouds, and it is barely one o'clock yet. There is a heaviness in the sky denoting snow at no very distant period. We will have a change—and a dace on a neat flight of hooks is cast upon the waters. Now is the time to test the quality of the pike fisher; if he can spin this dead bait well enough to deceive our pirate that roves the waters, we may put him down as being able to take his own part against Mr. Pike; a firm wrist and sharp eyes are required for this purpose. In good waters the perseverance of the spinner will be soon rewarded, the heavy weight and sudden rush showing we are fast, always bearing in mind to keep him well in hand and give no quarter except your fish abso-

lutely takes it; play him cautiously yet firmly, keeping his head below the surface of the water till the gaff or landing net fixes its victim. A word on this: I used a gaff hook for years, and I may say I have lost a number of good fish by the frantic efforts of the different gentlemen in gaiters to secure them. A very large folding net has solved all my difficulties, since the use of which I have hardly lost a fish. The day is waning fast; a coldness in the air and a fleecy fall of light snow warns us to commence our homeward journey. Once more the flask does duty for ourselves, Charon preferring the product of malt and hops. A rich red melancholy by this time pervades his honest features; he grows very confidential, and tells us how the water was let down very much in Mr. So and So's time, but that his present governor spares no pains or expense to have the fishing well looked after. We have another enemy, said he (as I was doing up my rod) that "I never hear you fishing gentlemen talk on, viz., the salt tides. Why," said he, "I have seen bushels of fresh-water mussels turn up by the salt water, and have seen dead fish by thousands as far as Horning Ferry." This is a state of things that I myself fear no Fishery Protection Bill can remedy. What an alteration in the aspect of the sky and water during the last hour! The air is cold and frosty, but everything is still and calm as we watch the receding lake.

"Its silver face,

Veiled by the wintry gloaming: silent voiced,
Cold, calm, and still as soft sweet maiden sleeps
A dreamless slumber in her virgin shroud.

"The alder boughs are fringed with diamond drops,
Rich pendant sparks that in the gloaming glint,
And glow, and glitter with a thousand fires,
Nature unsullied gems, chaste icicles.

"The heavy clouds enwrapped in leaden gloom
Grow thick with gathering snow. The sobbing wind,
In low dull angry murmurs o'er the fens,
Brushes their reedy armies, whilst the boom
Of the lone bittern, hermit of the waste,
Sounds o'er the mash, as sounds the knell of doom.

"The purple-crested mallard, from the sedge,
Whirls whirring upward, with a clarion shrill,
That bodes his quick alarm: The snow-flakes fall,
Fall thick and fast; and fast and faster still
Comes onward black robed night: The landscape pales,
The last faint gleams of sunlight die away
A death-like stillness falls upon the fens,
And all is silent as the reign of Death."

Gradually we near our homeward destination. I have sat musing over the description of the salt tides that I have heard from my companion, and I enquire the cause. It is soon given—"They will open Yarmouth Bar," said he. I ask no more questions, and we soon part. Sundry half-crowns change hands, and mutual expressions of good will are exchanged as well. What effect Yarmouth Bar has on our tidal rivers is as much a mystery to me now as ever.

G. G. W.

PRIVATE PIKE FISHING—THE BAIT QUESTION—AND RAILWAY CONCESSIONS.

THE thirty-first of March was a bright cheerful-looking morning above, but it was bitterly cold below. It was an idea of mine to test the character of jack-fishing in some private water thus late in the season, as, in the experience of many anglers, they are not so forward as in rapid streams and flowing rivers. I know that many of my good friends would be shocked in discovering my attempt to catch jack after the fourteenth day of March; but for "scientific purposes" and "practical experience," there is no small degree of palliation in doing such a thing. But, as will be seen, the fates were against me, and I was unable to carry out my intentions. My journey lay in the direction of King's Cross, and on studying my South-Western time table, I found the train from my station was due at Gunnersbury at 7.3,

and there was a train from there to King's Cross at 7.2. I could not help thinking this was a bad arrangement, but when I mentioned the circumstance to the guard and engine-driver they told me they would run me there in time for the Metropolitan, and therefore that difficulty was removed, their promise being duly fulfilled. I succeeded in getting to King's Cross a little before eight o'clock, the train I was going by having to leave at the half hour. I wanted to get some little information from the platform officials, and there was no difficulty about this, as the men employed by the Great Northern, as a rule, are experts at civility—very different to some lines I know, where it is impossible to get a courteous reply. The train I had to travel by starts from the local platform, but I could see nothing of my two friends who had arranged to accompany me, and in my anxiety about them the inspector and the guard feelingly took up my ideas, and were as anxious as myself for them to put in an appearance. The lower bell on the main line sounded "all right," but before giving the signal for the train to start I was kindly asked whether my friends were in sight, and giving a negative reply, away went the iron king. The inspector then informed me there would be another train at 9.5, and as I was ignorant of any other approach to the local platform, I calmly resigned myself to a seat on the main line platform, waiting with intense eagerness to catch a sight of my friends, as I was under the impression they must pass that way, but here again I was sadly disappointed, for I saw nothing of them, and after the bell had rung to start the train, I returned homeward. It has since transpired they had no idea of finding me on the main-line platform, as there was a separate approach and booking-office to the local platform; that one of the pair did not arrive for the 8.30, but both left by the 9.5, wondering where on earth I was, as I was never known to disappoint any one, little thinking if they had come under the arch which connects the two platforms, I was within a stone's throw, and full of anxiety about them. I had a glass of sherry with one of them the next morning as he said "To show there was no ill-feeling between us." And now, as to result, the paucity of sport gave evidence the fish had other duties to perform, and at the end of March it was unreasonable to suppose they would be found at large on the deeps. There is some good fish in the water, but only two of about 3 lb. each came to the bait and the landing net, in addition to a perch of 1½ lb. It is very clear, therefore, as far as this water is concerned, that jack-fishing in March has no legitimate or sportsmanlike character about it. I saw a fish of 8 lb., about a month ago, taken out of this water, and brought to the club-room of the Piscatorial Society, as full of spawn as possible. The members present expressed a regret that it had not been returned to the lake again, as it was bad to kill a fish in such a condition. Still, there may be other places, and I know of one at least where the jack during March are always in a good condition, and the proprietors willingly recognise the time; but there is one great difficulty attending this, and that is the bait question, for, according to the Fresh Water Fisheries Act of 1878, the fishing-tackle shops have no legal right to sell even a single minnow between the fifteenth day of March and the fifteenth day of June, both days being inclusive. It is doubtless a hardship on the respectable tackle shops, and I expect the argument against any relaxation in this respect would be an opening for the sale of freshwater fish under the pretext of being used for bait. This objection could easily be obviated by licenses for the sale of bait, such licenses having a merely nominal charge, and I am satisfied no respectable dealer would take unfair advantage such relaxation would assign to him. Then, again, now that the trout season has commenced, what have the anglers to do for bait? The law must be evaded somehow or other, as they cannot fish altogether without it. There are plenty

of private waters where bait could be obtained if the sale was recognised. The Bill to which I have referred does not prevent angling in private waters, or where Boards of Conservators have claimed exemption from it, but it prohibits the sale of freshwater fish wherever they have been caught. If the counties of Norfolk and Suffolk are exempt from angling under the Act, it is clear they are not as regards selling of the fish. No Act of Parliament will ever be complete that generalises one entire close period. It is a difficult question to legislate upon, inasmuch as some kinds of fish are much later than others in spawning, and in some waters the fish spawn at a different time to others. A complete and perfect law would, if it could be drawn up, almost give all the year round fishing, and the tackle shops and anglers would then have no period of suspension. The rivers and broads of Norfolk and Suffolk at the present time are open to the anglers. There is there no recognised close period, but there is one drawback to be removed, and that is this—the distance and necessary expense of getting there. I am perfectly satisfied with the liberal policy of the Great Eastern Railway, if the three associations of angling clubs would approach the management and directors, and point out the growing desirability of concessions of railway fares being made to Yarmouth, Lowestoft, and Norwich—the three great centres—facilities would willingly be granted. There are something like one hundred and forty London angling clubs connected with these associations, representing at least a constituency of eight thousand anglers, and it would be on behalf of these the Great Eastern Railway would be asked to benefit; and whilst benefiting them they would without doubt benefit themselves. Distance would be no object to the angler when the access to travel is made easy; and the boundless character of the fish farms of Norfolk and Suffolk will supply unlimited sport to the thousands who would avail themselves of it, especially at a time when all our metropolitan rivers are closed against them. I am satisfied this is just the time to deal with the question. It may be new to the present active general manager, but I am certain with his determined and enterprising spirit in conducting the management of the Great Eastern Railway, he will give the question his most serious consideration, and being satisfied with the mutual advantages to be derived from it, he will gladly recommend his Board of Directors to give a favourable response. B.

TIRED HANDS AND ARMS.—Edson's Electric Armlets and Wrist Bands. Invaluable for anglers and gun sportsmen and highly recommended for all persons having tiresome writing, sewing, or music practice. They give wonderful energy and strength, enabling the wearer to accomplish tedious work with steadiness and comfort. Price 2s. 6d. per pair, silk web and fine steel clasps. Sent to any address on receipt of P.O.O. payable to J. Edson, the Electric Fabric Co. Patentees, No. 1, Charlotte Street, Bedford Square, London W.C.—[ADVT.]

ANGLERS should always be provided with something to take away the swelling and poisonous effect of the bites of insects. They should also have with them something to apply to a cut or sprain. Pond's Extract reduces the swelling and inflammation, stops bleeding and pain, and hastens the healing process in case of any wound or sprain; and it has no equal for application to the bites and stings of insects. Therefore never go on a fishing excursion unprovided with a bottle of Pond's Extract. It is for sale at all chemists, at 2s. 3d., 4s. 6d., and 8s. 6d. per bottle.—[ADVERTISEMENT.]

TO ANGLERS.—W. J. Cummins, Fishing Tackle Maker, Bishop Auckland, is now prepared to forward to anglers his Illustrated Catalogue, which is not only a Trade List but is interspersed with practical hints, useful directions, and valuable information gathered by the river-side from twenty years' experience. The stock consists of his unrivalled Salmon, Trout, Grayling, and Pike Rods, Lines, Reels, Baskets, Artificial Baits, Fly-books, Landing Nets, Gaffs, and last, but not least, his celebrated Trout Flies, which for killing powers stand unequalled. Every article kept in stock is of the very best description.—[ADVT.]

GREGORY'S SPINNING BAITS.—"The Gregory," the "Flexible Cleopatra," the "Oxford," and the "Colorado," pronounced by all Anglers and the Press the best baits invented for salmon, trout, pike, and perch. To be obtained from all respectable fishing-tackle shops in the world, and wholesale from Messrs. S. Alcock and Co., Standard Works, Redditch. Flattering testimonials speaking of the efficiency of the baits have been received from the Right Hon. John Bright, M.P.; Mr. William Bailey, Nottingham; the Rev. E. C. Holt, Teddington; Sir William Calder, Kingston-on-Thames, &c. Gregory's registered Archimedean spinning tackle for pike and trout, now ready, is pronounced by the press the best ever invented. For use with dead bait. The tackle is complete in every respect, and can be adjusted to suit bait of any size. Has been tried with remarkable success.—See that the name "Gregory" is impressed on the Archimedean fins, as inferior imitations are offered for sale, and people are thereby disappointed and deceived. Address, James Gregory, Vyse-street, Birmingham.—[ADVT.]

GEORGE JAMES EATON, of Starkholmes Matlock-Bath, Derbyshire, respectfully invites Noblemen and Gentlemen to try his standard FLIES for the present season. No flies sent or made up but what he himself has proved sure killers. A trial is all that is required from gentlemen who can fish to prove whether they may be genuine or not. Patronised by some of the best fishermen of the day. All flies dressed on the best Kendal hooks. Prices: Point Flies, 2s. 6d. per Dozen; Dropper Flies, 2s. per Dozen. Orders punctually attended to.—[ADVT.]

SPECIAL NOTICE.

Friday, the 15th inst., being Good Friday, the publication of the **FISHING GAZETTE** will take place on Thursday, the 14th inst. Notices and Advertisements must be delivered on Wednesday, the 13th inst.

RIVER REPORTS

MID-THAMES.

"The nature of bad news infects the teller."

—SHAKESPEARE.

I had hoped to have reported some big catches of the spotted leopards, but this *bête noir* of a wind has upset the feeding proclivities of the scaly beauties, and I am left lamenting, not having any news worth ink to report or any prognostications of a favourable character to indite. At Marsh Pool, Humbledon, Newlock, Marlow and Boulter's Weirs, anglers possessed with the "faint heart never won fair lady" principle, have been paying their matutinal and vespertine devoirs; but no flight of imagination or reality would induce the full-blown beauties to be tempted from their aqueous homes, and many an angler, after tailing and spinning in vain, has wished himself *any weir, any weir* out of the wind, and has eventually gone home heavy in heart and lighter in pocket. A river-trout angler, who has hitherto been very successful, tells me that he, in a twenty years' experience, never remembered such a continuous, marrow-freezing, and sport-destroying wind, and that it was positively dangerous in some exposed situations to be on the water. My advice to Thames troutists is to wait until some warm showers enter an appearance, and the wind is S. or S.W., and then take the 12.1 a.m. train to a favourite *weir*-about, and sport will most assuredly result.

THURSDAY EVENING.—The river is low and bright, but otherwise in every apparent good trim for spinning, but a strong gale is blowing from the N.E. to E., and under this condition of affairs successful trouting is almost hopeless.—MARLOW BUZZ.

Thames (Windsor).

No one would think it possible to walk from Windsor Bridge to Cookham Bridge, a distance of 11 miles 2 furlongs, without, in April, seeing a few fish or a few anglers knocking about, but such is the state of the Thames this season up to the present, owing to this piercing wind, which we have had now for nearly three weeks. I walked the towpath yesterday, calling at Bray, Maidenhead and Cookham, and the whole distance was more like a sea than a river. To notice a fish moving, even if one had done so, would want sharper eyes than I am possessed of. At Bray, the Rev. Fardell, of Jesus Hospital, had a pretty little fish on Monday, going 2½ lb., and at Maidenhead I could hear of nothing beyond four small fish taken by Harry Wilder, with a patron, and doubtless Wycombe fish. At Cookham that well-known fisherman, E. Codder, has his eye on a brace of something larger than "brownies," and as soon as it turns to the balmy will introduce some of his patrons in the hope of closer acquaintance. James Gray, who is daily on the water, tells me he has not seen a fish move since the close season. I have not wetted a line, and do not intend till this wind shifts, and consider it next to useless, to say nothing of the misery. Thames trouting is bad enough at the best of times. The members of the Windsor and Eton Angling Club, held their annual dinner at the Royal Oak, Windsor, on the 1st inst., when prizes were awarded to Messrs. Parsons (five prizes), Bambridge, of Eton (three prizes), Stevenson, of Windsor (two prizes), and Linford (one prize) for heaviest and gross weight of fish.—B. R. BAMBRIDGE.

Dove (Derbyshire).

The easterly winds have had the effect of both driving the anglers away from the river banks, and also the fish off the rise. I never knew a severer week than this in April. We might have been in the Polar regions, and still at the same time the sun has been out every day. I hear that the protracted piercing winds are doing much injury amongst the trout fry. I regret to state that Mr. David Foster, the well-known naturalist-angler, of Ashborne, on the Dove, is seriously ill, and not expected to recover. Mr. Foster has been celebrated for many years throughout the country as a fly-tier.

Exe (Tiverton).

Fly-fishing, trout. Very little is being done during this dry, cutting N.E. wind and rising barometer. The river has shrunk away very much; fine tackle and small flies and a hardy constitution is what is required just now. The flies that are killing best are the blue and red upright, hare's flax, and iron blue. There will be no good sport until we have had some rain, and the wind shifted to the opposite quarter, which will make it more pleasant by the river side.—WM. MUDFORD, Tiverton.

Exe (Exeter).

"Jack Frost," who has been with us more or less since last October, still sticks to us, and there has been plenty of ice nearly half-an-inch thick, every morning during the past week, which is vastly different to last season, when the hedges were budding out, and now, even in the most sheltered parts, have they made but very little progress in that way. I wish I could reiterate my statement of last week, in the way of sport, for the sake of those who face these cold east winds, in which quarter "Boreas" still reigns supreme, and

were it not for the bright sunshine we might once more imagine that the winter was just commencing over again, which is not a very pleasant feeling after so many months of cold sport. Very little has been done in the trout way, and but few salmon have been banked, although the gentleman, as reported last week, who had secured eleven fish to his creel, has increased that number by two more splendid fellows. By the way the three fish taken by him last week should have been one 8 lb.; one 9½ lb. and one 12 lb., instead of as they appear in the **FISHING GAZETTE**, as 1 lb. 8 oz., 1 lb. 9½ oz., and 1 lb. 12 oz. Of course any one can read it is a mistake. I believe there were two or three others taken, but have not had particulars, so must report next week. A quantity of roach and perch have been seen here, exposed for sale, all full of spawn. They had been netted, but from whence they came I could not ascertain. Flat fish, &c., from estuary more plentiful, and as the tide serves more favourably this week, we may hear of some good sport, especially if the wind shifts more southerly.—FRANK GOSDEN.

P.S.—Mr. C. Blake, of the Museum Hotel, Exeter, has just informed me that trout fishing on the Torridge has been very good, and that several salmon have taken the trout fly.—F. G.

Suir and its Tributaries, Clonmel, (Ireland).

The cold easterly wind still prevails, with bright sunshine, but notwithstanding that there have been some salmon caught. The Cahir Club have had pretty good sport, Mrs. Grubb landed two fine salmon on Ballybacon stream; on Tuesday, James O'Donohue killed the first salmon on Dudley's stream this season, 10 lb., and fresh from the sea; Thomas Phelan killed one on Monday, 9 lb., and one on Friday evening at 7 o'clock, 17 lb., on Lord Donoughmore's preserves; Bryan Connors got two at Poul-ma-quorish, weighing 30 lb. and 10 lb. The cotmen got fifteen last week, the corresponding week last year they got but ten. The price of salmon at present is from 1s. 10d. to 2s. per lb. There is great poaching going on on the river between Thurles and Cashel, men with nets sweep the river on every opportunity, and sell the fish in and about Thurles for a ridiculously low price. There's a gang of stroke-haulers at Roultrough almost every day when they get the bailiff's back turned; they place spies on the Bridge, so that they can kill with impunity the fish trying to get over the weir. The trout fishing is not at all good this week; water so low in every place, and sun so bright, fish won't rise.—DORA.

Swale.

Another heavy mantle of snow has fallen in the Yorkshire dales, which will again postpone the opening campaign against the finny tribe. I, however, according to promise, send a list of six of the very best and earliest flies which anglers can hold in readiness for commencement. I furthermore put them in the regular order in which they will probably appear. They can all be made on hook, No. 2, Hutchinson's manufacture:—No. 1, early brown, "Inside woodcock;" body, yellow silk; legs, red hackle; wings, woodcock's quill from underneath the wing. No. 2, red brown, "Old Joan;" body, peacock's harl; wings and legs, dark red hackle. No. 3, "Royal Charley;" body, orange silk; legs, freckled hackle, from red or golden dun hen; wings, partridge grey feather tinged with brown from side of breast. No. 4, light brown, "Outside woodcock;" body, orange silk; legs, red hackle or mohair; wings, dark woodcock. No. 5, blue drake, "Blue dun;" body, orange silk tinged with fox-cub's down; legs, a few fibres of amber mohair; wings, starling's quill. No. 6, brown drake, "March brown;" body, grey hare's ear ribbed with straw coloured silk; legs, partridge's back; wings, grey partridge's tail. Some fishermen vary the above details a little, but I venture to think that in the main they cannot be greatly improved. The female march brown is made as above, but with wings from the hen pheasant. I have always killed better with the partridge dressing.—THOMAS FORD.

Trent (Nottingham).

Owing to the close season now being on of course I have little to say as regards rod-fishing, but I might make one remark, that it is the general opinion here that the time is too long. Mr. James Goegory's time is considered right and all that is necessary—from the 15th of May up to the 15th of June, and no fish to be exposed for sale during that time, which, of course, will put a little check on the netters taking the fish at the spawning season. Pike have been seen going through their usual work at this season, and dace in the shallow streams were busy, but owing to the cold east wind neither fish have shown in any quantities. The anglers on some of our small streams commence fishing for trout on the 1st of April, which I think is a little too early, as most of the fish that have been caught up to now were not found to be in such good condition as they would have been a week or two later on. The 1st of May, for small streams, I think is the proper time to commence trout fishing. They will then take cadbaits, the cockspur, on the bottom, and on fine days the fly on the surface—all of which are then taken freely. These few hints the proprietors of certain waters might watch for the next season.—W. BAILEY.

Tweed and Teviot.

Another week of very inauspicious weather has rendered angling both for trout and salmon a very trying one for the patience and perseverance of the disciples of the rod and line. On the Sprouston water on Monday last Mr. Ferrand landed one unseasonable fish, and in the Kelso district a few good baskets of trout were got the same day, but, of course, the speckled beauties were in anything but the best of condition, being still far from firm, and in a lanky state. On the Teviot, a little below Jedburgh, Mr. Valentine Knight, Orchard House, Jedburgh, killed a clean fish of over 10 lb. On Carham water, in the Tweed, Mr. James Moffat, Edenhall, Kelso, has had the good fortune to be the most successful angler as far as the season has gone, as he in one day killed three clean salmon, besides landing some half-dozen of unseasonable salmon on the same at Sprouston water. Mr. Ferrand killed a sea trout and landed some kelts on the Twizel water, in Tweed. Mr. Etty has had good sport, killing four clean fish with his own rod—all being taken with the minnow, the fish utterly refusing to look at fly, although put over them for half a day. The Teviot, which is teeming with fish, both clean and foul, has also yielded up its quota to the number of clean fish killed. The reports from the netting stations are not very encouraging, as the cold and bleak weather is very much against the fish entering the river from the sea, and the takes, consequently, are very moderate. Some of the stations are doing better than others, the takes at the more favoured places being reported as from five to six fish at a haul, but this only occasionally. The fungus disease is very rife in both rivers, some hundreds of dead and diseased fish having been taken out of both Tweed and Teviot by the water bailiffs, and buried. It is no uncommon sight to see in one pool as many as half a dozen large-sized salmon together, nearly covered with this loathsome disease; but we are informed by those who are in authority that the disease was a good deal worse last season, when, out of a stretch of nearly fifty miles under the surveillance of the Tweed Commissioners, their bailiffs took out

nearly 5000 diseased fish or those that had died through the effects of such disease."—*Edinburgh Daily Review*.

Waveney (Beeches).

The water has now cleared nicely from the snows and floods of winter, and is in about as good order as can be desired, but with the wind at E. and N.E. there is not much pleasure to be derived at the river-side. Should the wind veer round, however, to a warmer quarter, anglers might have an exceptionally fine time, as the fish appear to be more numerous than has been known for many years, owing, no doubt, to the operation of the Fisheries Act, which has made the immense nets at one time so common here already things of the past. A few good takes of roach and perch have been had, and a goodly number of pike have within the last few days been secured, varying from 3 lb. to 10 lb. in weight. Smelts have just made their appearance in the rivers, but not in very great numbers at present, and while smelts are about pike will hardly look at anything else, having, I suppose, a weakness that way. Perch appear to be getting very full of spawn now, but roach are still rather backward. —C. B.

Wye and Derwent (Derbyshire).

Both weather and water are now in excellent condition for fly-fishing on both the above rivers. If it were not for the nasty easterly winds that have been prevailing the whole of the week, no doubt good sport would have been had, for there has been very many natural flies, and on both rivers during the week, principally browns, but very few trout rising at them. I have noticed now for very many years that wherever the wind is from the 21st March to the 25th inst., it generally prevails nearly the whole of the spring in that quarter. Trolling with the "Derby Trout Killer" has been followed with fair success near Matlock, and several young trout have been killed. The bottom fishers have done very little this week. The night-line party still keeps killing a few trout between Darley Bridge and Matlock, with large lob worms for baits. I have just seen Mr. T. Ford's, Caistor, Lincolnshire, "Little Shilling Manual of Flies," and to any angler meditating a visit to any of the Yorkshire rivers, I can strongly recommend this book to them as a guide as to the best kind of flies to be used, and the proper way to make them. I sincerely wish him every success with his book, which is worthy of a place in any gentleman angler's library. —GEORGE JAMES EATON.

P.S.—All anglers fishing in Derbyshire on either the Wye or Derwent are required to get a trout license. The price is 1s. for the whole season.

Yore (Yorkshire).

The winds still keep in the north, so that very little improvement has taken place in fly-fishing. I have only heard of one decent dish of trout having been killed, and that numbered ten fish. Easter is a great carnival among Yorkshire fishermen, but I am sadly afraid that it will prove a disappointment, unless there is a change during the next week. There have been a few March browns on the water, and the best dressing for this fly at present is the following:—Wings, from the tail of a partridge; body, red silk ribbed with olive; legs, grey feather from a partridge's back; tail, two strands of the same. Both the Yore and Wharfe, at the time of writing, are excessively low and clear; so that, to ensure success, the angler must fish well up stream with the finest of tackle. —FRANCIS M. WALBRAN.

NATIONAL FISHERIES EXHIBITION AT NORWICH.

In our advertising columns will be found the announcement of the train arrangements of the Great Eastern Railway for the opening of the National Fisheries Exhibition at Norwich, on Easter Monday. Apart from its own intrinsic merit as a rare exhibition, the fact that it is to be graced by the presence of the illustrious and beautiful Princess of Wales, must tend to intensify the interest attaching to the opening of it by the Prince of Wales, and we are sure that large numbers will avail themselves of the Easter holiday to make a trip to Norwich for the opening of the National Fisheries Exhibition, and take advantage of the liberal arrangements offered by the Great Eastern Railway.

NORTH-WESTERN RAILWAY.—Easter Holiday Arrangements.—We beg to call the attention of our Readers to the detailed announcements of the Easter holiday arrangements of this Company to be found in our advertising columns. We may mention, that for the convenience of the London public, with the usual forethought and courtesy indigenous to the officials of this line, the ticket offices at Euston, Broad Street, Kensington, and Willesden Junction, will be opened throughout the days of the 13th, 14th, and 18th of April, so that intending travellers can obtain tickets prior to the day of starting, and have the tickets dated to suit their requirements. Tickets will also be issued at all the town receiving offices of the Company on all days except Easter Sunday and Monday.

A NEW MINNOW NET.—Nashville, Tenn.—Editor *Chicago Field*:—This simple contrivance astonishes all who see it, because they naturally ask the question, how it was that no one ever thought of it before? A globe of wire netting split in two, fastened at the bottom by hinges, and attached to a stick by strings from the top: this is the whole affair, save a small place in the centre for bait; the two hemispheres are so arranged as to open partially from their own weight, if allowed to touch bottom; or they can be separated by pulling one of the strings above mentioned. As minnows are generally found in shallow, clear water, it is easy to see when enough have entered the trap, to close and draw it out. This invention does away entirely with seining, and the disagreeable necessity of wading in the water. The pole or stick upon which the trap is hung, may be made of any desired length, and jointed, thus permitting the entire apparatus to be packed in a small space. Those of our Nashville anglers who have seen it, are of the opinion that nothing else will be used for catching minnows, once they become known. —CLIMAX.

A GOLDEN EAGLE.—On Thursday, Mr. Hood, principal gamekeeper to the to the Baroness Willoughby d'Eresby, trapped in Turleum Forest a large and beautiful specimen of the golden eagle. It measured from tip to tip of wing 7 feet 10 inches. The bird was caught by the claws, and it is now safely caged at Drummond Castle.

A FISHERIES EXHIBITION IN EDINBURGH.

A SHORT time ago, the propriety of holding a Fisheries Exhibition in Edinburgh in 1882, similar to that to be held at Norwich in the course of next month, and to that which proved so great a success at Berlin some time ago, was advocated in these columns. It is said that a suggestion has since been made to the Highland Society to have a fisheries exhibition in Glasgow along with their show in 1882. There are, however, many strong and cogent reasons for holding the first fisheries exhibition in Scotland on a great scale—if it is to be held at all—in Edinburgh. In the first place, all the boards and associations which have the supervision of our fisheries, or any connection with them, have their headquarters in Edinburgh—such as the Board of White Herring Fisheries, the Board of Northern Lights, the Salmon Fishery Commission, and the recently-formed Scotch Fisheries Improvement Association. In the second place, our most productive fisheries are on the east, not on the west, coast. The herring fishery—the most valuable fishing industry in the United Kingdom—has its chief seat on the east coast, the Aberdeenshire ports alone receiving more herrings than the whole stations on the west coast. The cod, ling, haddock, and other hook-and-line fisheries on the east and north coasts are also far more valuable than those on the west; while, as regards the salmon fishing, the rental of the Tay and Spey only, taken together, is equal to the rental of all the salmon rivers on the west coast, from Cape Wrath to the Mull of Galloway. In the third place, it may be doubted whether there is any place in Glasgow so suitable for a Fisheries Exhibition as the Waverley Market in Edinburgh, which has not only a most advantageous situation and a vast area, but also possesses the further advantage of having the aquarium beneath its roof, from which supplies of salt, as well as fresh, water might be had for the purposes of such an exhibition. In the fourth place, the Highland Society's Show in Glasgow will last, we believe, for three days only. But three days is entirely insufficient for a Fisheries Exhibition, which should remain open for a fortnight at least. That to be held at Norwich next month will last for a fortnight, and that at Berlin was open for at least as long a period. Without insisting, therefore, on what may be thought the more sentimental argument, that Edinburgh is the capital of Scotland, it seems to us that the practical reasons brought forward above are amply sufficient to prove that Edinburgh is the natural and proper place for the first great Fisheries Exhibition that is to be held in Scotland.

With regard to the means of meeting the expenses connected with such an exhibition, it should be borne in mind that, besides the sums derived from single and season tickets of admission, a considerable revenue may be expected from the sums paid by exhibitors for space to display the articles which they exhibit. At Norwich, the charge made is 15s. per superficial yard for ground space, and 10s. 6d. per superficial yard for wall space. It is stated that the space at the disposal of the Committee has been pretty well taken up; and the belief is that no less a sum than £600 will probably be derived from this source alone. —*Scotsman*.

THAMES ANGLING CONVICTION.

AT the Chertsey Bench on Wednesday last, Alfred Harris, fisherman, Laleham, was fined £2 and one guinea costs; and two anglers who were with him were each fined £1 and one guinea each costs, for fishing in the Thames in the close season at Borough Head. The defendants all pleaded guilty, and the fines were paid. The proceedings were instituted by the Thames Angling Preservation Society upon the evidence of Alfred Thompson, one of its wholly-paid keepers.

AMATEUR SEA-FISHING.

(Continued from page 135.)

ALTHOUGH we are coming now close to the end of our tether, we cannot refrain from an allusion to dear friend Buckland's graphic description of his cruise with "An old man-of-war's-man, Robinson Crusoe, an outing with whom will be found in his "Log-book of a Fisherman." We do not intend to reproduce that admirable Charles Lamb-like sketch of the veteran George Buller, then living in a little by-way of Gosport, but rather to supplement the anecdotes given of him by the "Missing Link," by one which appertains to our text.

We were well on board, with all ready for deep-lining, and had dropped anchor, waiting for the tugs which did not come, when it was suggested that Robinson Crusoe should give us a yarn.

He was nothing loth, so, shifting his quid from one side of his mouth to the other, while sending forth over the gunnel an amber jet, he commenced :—

"I was a bit of a boy at the time, in a frigate laid up in the Chatham lines. My master was the bo'swain of her, and there was only the three warrant officers on board of her. Well, the guard-boat of the commodore's ship was rowing about all night, and if they passed a ship that did not hail them, they would go alongside and steal anything they could get hold of, and carry it ashore in the morning to the commissioner's office in the dockyard. One night my master, the boatswain, had the first watch; and, having been ashore all day on duty, felt very tired. He told the boy (Toby) to keep a good lookout while he went down into the galley to smoke a pipe, and he went down and fell fast asleep. The boy, not accustomed to keep his eyes open, fell asleep, too, and the guard-boat, passing, hailed them; when, receiving no answer, they went alongside, and actually unshipped the bell from its place, carrying it quietly over the side without being found out. At twelve o'clock the bo'swain awoke from his sleep, and, going to strike the bell, found it gone. He immediately knew who had taken it; so, calling to the boy, and after bestowing a good deal of 'Latin' upon him, said to him :

" 'Now, there's only one thing can save my warrant and your back, and if you don't get it for me I'm done. I must have the commodore's broad pennant before to-morrow morning.'

"He accordingly got into the punt alongside and took the boy with him, and, pulling quietly ahead of the commodore's ship, got under her bows, and the boy, laying hold of the mooring chain, swarmed from thence to the bobstays, and getting up to the bowsprit, went quietly along the forestay into the foretop, and from thence to the main-topmast-stay to the masthead, finally to the truck, where, unbinding the flag, he stuffed it into his bosom. Being the night pendant, it was not very large—so, returning the same way unobserved, he got down the mooring chain, and giving a low whistle, the bo'swain, who was some little distance off, dropped under the bows and took him in. The bo'swain was highly delighted with his success, and the next morning, giving the boy directions, when he should wave his pocket handkerchief, to hoist the captured flag at the ensign staff, he went ashore to the dockyard to answer the signal that was made for him. He went boldly to the commissioner's office, having just made the sign to the boy to hoist the flag, and there was the commodore, who always attended to such complaints as might be made, sitting with all the gravity on his countenance which such a case demanded. The bo'swain was called, and, with his best bow, wished to know what he was wanted for. 'Mr. So-and-so,' said the commodore, 'I am very sorry, very sorry indeed, that such a gross neglect should be laid to your charge, as that now preferred, sir. The guardboat went alongside your ship, sir, last night, sir, and during your watch, as is proved, took away the ship's bell, sir. Now, sir, you must either have

been drunk or turned in, both of which are very great crimes, sir; and I am sorry, truly sorry, that I shall be obliged to report your case to the navy board, when you will be sure to lose your warrant, sir.'

" 'Very sorry, your honor,' said the bo'swain; 'shore; knocking about in the dockyard all the day; not asleep a minute.'

" 'No excuse, sir, no excuse at all for such a gross neglect,' replied the commodore. 'Why, sir, if such a thing was to go unpunished, we should have the commodore's ship as bad as yours.'

" 'Why, your honour,' said the bo'swain, 'your ship has got a full complement of men on board, and sentries in both gangways, and, for all that, ain't so much better after all.'

" 'What d'ye mean?' exclaimed the commodore. 'Not keep a good look out on board my ship? What d'ye mean, sir?'

" 'Why, sir,' replied the bo'swain, 'when I found my bell gone at twelve o'clock last night, I sent aboard your ship, and got your broad pendant to save my warrant.'

" 'My broad pendant!' cried the commodore, as blue as a bursted gooseberry.

" 'Yes, your honour; and if you will just step outside, I will show it you, flying at the flagstaff of my ship.'

"Accordingly the commodore and all his officers went out, and sure enough there was the pendant, as the boatswain had said. The flag had, it seems, been missed in the morning, and they had put it down as blown away.

" 'Oh!' exclaimed the commodore, 'the boatswain has quite weathered me—I had better say no more about it.'

" 'So you see,' added Robinson Crusoe, 'the boatswain, after all, bore off the bell.'

It must not be supposed that the old salt's yarn interfered with our fishing, for he went on with his story as he took off the fish and re-baited the lines of a lady who was with us, and who, by-the-bye, far excelled us in the number of codling and whiting which fell to her share.

Upon one of our party asking Crusoe whether there were not several sorts of flounders, he told him that there was the dab, the rough dab, and the smear dab, as well as the true flounder; then there is the top-knot flounder. "But here," he observed, taking out a greasy pocket-book, "is what Mr. Buckland wrote with his own hand. Besides what I have told you, is the sail fluke, the carter, Muller's top-knot, Block's top-knot, and Elstrom's top-knot, the long flounder and the megrim or scald fish; so there's a pretty good lot to tell tother from which, but he could do it (meaning Mr. Buckland), and if he was in doubt he'd make the fish tell him before he had done with it." But we must part company with our old friend here, as our own description must be more concise. Still we should like to know whether George Buller the old man-of-war's-man is still living. His address when we last profited by his services was, 3, Willow Place, Mill Lane, Forton, Gosport.

The dab is a little thicker than the plaice, but much inferior to it in dimensions, and the scales are larger in proportion to its size, but it is without spines, the dark side is of a pale brown, sometimes clouded with a darker colour and speckled with spots of a dusky yellow, the lower side of a pearly-white by it may be distinguished from any other flat fish. The dab, as we have already stated, although smaller than the plaice, is far superior in goodness, being almost equal to the sole. The Southampton waters are famous for them, and we have there frequently hauled them on board two at a time as fast as the lines could be let overboard. The hooks should be small, and whipped to stout silkworm gut—for there is little or no fear of meeting with fish of formidable calibre in this estuary—and the baits kept just clear of the bottom. Off the pier, at Southend, used to be a

good situation, but you should visit the ground when the tide is out, and picking a spot free from weeds and stones and of a sandy soil; mark the rail of the pier over it, that you may find it again when the tide is up. They bite best during the time of slack water, or when there is little tide running. Like the plaice, they prefer deep water, seldom venturing near the shore between high and low water mark.

The rough dab is of a much longer form than the common dab, and grows to as large a size as the plaice. The form of the body is an elongated oval, almost equally pointed at both ends; the parts of the mouth are capable of some protrusion. The eyes are large, the upper one a little before the other; the orbits separated by a long ridge. The dorsal and anal fins extend almost to the tail, which is slightly rounded; the cheeks and body are covered with rough scales, the lateral line straight, or very slightly inclining as it approaches the operculum; the upper side is a pale brown, the fins lighter, the lower side white. This fish is rarely met with on our coasts. They are, however, frequently taken on the coast of Heligoland with a hook and line. Their usual food is small crabs and lobsters.

The smear dab: This fish has many aliases in different parts of the kingdom. In London it is known by the name of the smear dab, at Bath by that of lemon sole, at Plymouth it is called a merry sole, and at Penzance a queen. It is, however, by no means so common, nor, in our humble opinion, so good a fish as the common dab. The head is very small; the dorsal fin begins very near the mouth, and extends almost to the tail; the dark side is of a light brown colour, spotted with yellow; the eyes are rather close to each other; the irides pale yellow; the mouth is full of small teeth; the lateral line slightly incurved at the origin, and then continues straight to the tail and the upper side is covered with small scales. The margin of the gill covers is yellow, the lower side white, although it is sometimes marked with large dusky spots. It takes the same bait as the plaice, but it is much more frequently caught by trawlers than with hook and line.

FISH-CULTURE AT CHERTSEY.

MR. JAMES FORBES may well be complimented upon his indomitable perseverance in the laudable attempt to multiply the number of sportive fish in the Thames, for which the hearty thanks of all true anglers are due. Still, I am, in common with many advanced pisciculturists, in great doubt whether valuable time and cost is not ill-directed in the task of producing hybrids. Mr. Frank Buckland did this more from a desire to render the process of fish-hatching at South Kensington popular and attractive; for he did not hesitate to say that there existed grave doubt whether or not he was breeding a colony of fish which would be unable to comply with the command of nature—to increase and multiply. There is, however, consolation in the fact that the hybrids—although they may be doomed to a life of celibacy and single blessedness—have an equal chance of attaining the same age as their fellows, the amorous and vigorous Benedicts. B.'s hopes of the Thames being ultimately stocked with the several lesser orders of salmonidæ will, I think, appear to many to be somewhat cloudy, and shrouded in anomaly. He writes, "For several years Mr. James Forbes, of Chertsey Bridge, has been actively engaged in the culture of various species of salmonidæ; and although the river which he intends to benefit has not, at present, received any material advantage from his work, the prospect is not far distant of its obtaining an increase of one of the best kinds of fish—the real Thames Trout. There is nothing in the way of speculation as to the result being realised, &c." Thus B. jumps to the conclusion that because Mr. Forbes will succeed in hatching out troughs of eggs from trout caught at Sunbury,

"there is nothing in the way of speculation as to the result being realised." That is, the consummation of "material advantage" to the Thames. Indeed, it would seem that B. makes this tremendously venturesome leap into the future from premises consisting only of ova "approaching vivification, in which the eyes are plainly visible, and the eggs look strong." There is an old and familiar adage respecting the counting of eggs which would aptly apply here. The fact is, this sanguine language, almost word for word, has been applied to the infancy of every experiment since pisciculture took root in England, and the mere assertion, from a view of the ova, that such and such happy consequences must tend to an accomplished certainty, no more removes the present experiment (for such only can it be considered), from the possibility of those failures attendant upon others regarding trout ova of various kinds. And I have little doubt Mr. Forbes, with his long experience, looks upon the chances, despite the flattering unction thus administered, in this light.

It is highly praiseworthy in Mr. Forbes to leave no thought untried, but an unqualified pronouncement of certain and unalloyed success, founded upon such unstable grounds, if it encourages hope, cannot but add to the poignancy of disappointment should such be the fate of the trial.

I am quite prepared to admit, with the Rev. J. J. Manley, in his "Notes on Fish and Fishing," that the Thames trout is "one by himself," as the country folks say, and I further quote "He differs from all other kinds of trout. He is not of any distinctive species yet recognised by naturalists, yet he is very distinctive. He is not of the family of the great lake trout, *Salmo ferox*, nor is he a bull trout, *Salmo eriox*; nor a white or sea trout, *Salmo trutta*. Ichthyologically he is certainly a brown or common trout, *Salmo fario*, but truly an uncommon common trout." But in conceding this much, I am far from being disposed to acquiesce in the notion that there is anything in the nature of the Thames trout to justify the *ad captandum* declaration that a different and more congratulatory result will follow the vivification of the ova of the Thames trout than that which has been the case with the eggs of its congeners. The reverse, I take to be dogmatic and presumptuous.

I have every reason to believe that Mr. Forbes' reward is not to be looked for about Chertsey, and that those juvenile trout which have survived the ordeal of the rapacity of every fish in turn, are now far from the scene of their birth. The nature of trout is to head up against the current; small fish seek shallow, colder, and sharper waters, which are not to be generally met with until the higher portions of a river are reached. Indeed, we have evidences, year after year of late, that in the pools of the disused weirs, even above Oxford, a marked increase of trout is to be found, and as there exist no artificial breeding operations in those districts, it is but fair to attribute this augmentation to the most reasonable cause, and that cause may be (I do not positively say it is), the breeding operations of Mr. Forbes at Chertsey. Ere long, when the trout in the upper reaches have outgrown their quarters, it may be found, as elsewhere, that they will drop down into deeper waters, and then, perhaps, again visit the locality of their nativity, grown in "strength and stature."

But, whatever may be the ultimate consequences of Mr. Forbes' unselfish and noble efforts to add value to the resources of the Thames, one thing is clear, that neither he, nor I, nor B., can foretell, with any claim to attention, that there is nothing in the way of "speculation" as to the results of "material advantages" to the river. In B.'s case, the only reliance on which appears to rest upon the fact that the germ from which the blessing is presently to flow, is now in a healthy condition, with eyes plainly visible, and awaiting vivification. Would that, for the nonce, B. could truthfully claim the gift of sacred prophecy!

I am quite in accord with B that "it is incumbent to maintain a stock of the finny tribe for the largely-increasing number of anglers, whose constant visits must decimate its numbers to a terrible extent." But would it not be well occasionally to trace effects to causes—to ignore the parrot-cry that fair angling can never injure a fishery, and denounce fearlessly and outspokenly, which but few writers as yet have done, the "terrible extent" of decimation occasioned by the demoralising and pot-hunting system of gross weights?

CONSISTENT.

COMING EVENTS CAST THEIR SHOWERS BEFORE.

Past is the Winter numbing;
 The Spring-time fast is coming;
 Soon in each nook,
 My babbling brook,
 By thee will bees* be humming,
 Half-hid in flowers—now growing—
 Then blooming—whilst, on-flowing,
 Thy charming stream,
 Thro' changing gleam
 And shifting gloom, keeps showing.
 How—glancing in the glory
 Of Sol's rays, raining o'er thee—
 Bright brook, thou'lt shine!
 His light divine—
 Half-veiled—will, *con amore*,
 Thy trouts bring on their rising
 At March-browns appetising;
 I'll hook a lot—
 If *Luck* I've got—
 The deadly lure disguising.
 Last Monday—by the Powers!
 That seventh of March of ours—
 There fell that day
 (As Pat would say)
 Our first of April-showers.
 I said "You'll make, old fellow,
 The primrose yet more yellow,
 And violet, sir,
 Peep purplier,
 You are so soft and mellow!
 "And if snowdrop and crocus
 Within my muse's focus
 Come not, you know
 Those blossoms blow
 Ne'er where you seek to soak us.
 "Nurselings of Art—not Nature's
 Free-born, wild-floral creatures
 That to yon skies
 Our thoughts bid rise—
 The angler's moral teachers.
 "Good day! sweet Angling-weather;
 But when, with fur and feather,
 Me on the feat
 You chance to meet,
 We'll chat again together."

A. R. I. E. L.

March 12th, 1881.

* Umble-bees, as Uriah Heep would say.

Mrs. F. Y. BROCAS, Artificial Fly Dresser, 4, Mill-street, Conduit-street, Hanover-square, London, W. A stock of best flies always on hand. Flies made to pattern. Lessors in fly making given.—[Advrt.]

CORRESPONDENCE.

[We do not hold ourselves responsible for opinions expressed by our Correspondents.]

ANSWERS TO CORRESPONDENTS.

A LOVER OF THE SPORT.—You had better get Stewart's "Practical Angler"; it can be had of Mr. W. J. Cummins, fishing-tackle maker, of Bi hop's Auckland, for 2s. 8d. in stamps.

J. C., Little Tower Street.—The only place we know of that would suit you is Winchester. The trout run large, are very numerous, and a skilled hand will always make a fair basket. You cannot get good trout-fishing by paying for it nearer than Winchester.

H. T. H.—In the GAZETTE for 1879 and 1880 we published some recipes for varnishing rods.

THEORY OF ARTIFICIAL FLIES.

SIR,—Verily I am overwhelmed with all the opprobrious epithets and inuendos that have fallen on my head for having set forth an opinion on the use of artificial flies which does not fall in with that of Mr. G. F. Horsley. His letter, written in answer to mine (after second thoughts, I suppose, as "it would have been a waste of time, and unprofitable to explain his knowledge (?) and experience to one who seems fast wedded to Pennell's theory of three flies," which is untrue, as, though I use only four flies, they are not Pennell's)—his letter, I say, deals with a subject on which there are dozens of widely different opinions, and having found some one who does not hold the same theory as himself, he forthwith proceeds to pour forth his invectives against him with totally unnecessary warmth. However, I will try to answer some of his wrathful arguments (?) in as mild a tone as my ruffled spirit will allow. I suppose that Mr. Horsley is a well-known and widely celebrated angler, or else he would hardly have the "cheek" to call Mr. Pennell's theory on flies "theoretical stuff," as Mr. Pennell asserts in his "Practical Angler," that he has tested his "three-fly system" (here called "theoretical stuff") in nearly every river and lake of Great Britain and Ireland, and by their use has always secured a larger and heavier basket than any other anglers that accompanied him. I presume, therefore, that his opinion on flies is worth something, and not merely "theoretical stuff," as Mr. G. F. Horsley is pleased to call it. He next cites an instance of which I don't see the point at all, as it is a well-known fact that when trout are rising at any particular fly on the water, they will usually rise far better at an artificial one of an entirely different species. Mr. Horsley next remarks that the "three-fly system" is only adapted to cockney sportsmen; here, I think, Mr. Horsley's "cheek" reaches a climax, in coolly calling such great authorities as Mr. Pennell and Mr. Stewart cockney sportsmen, for holding opinions opposite to his own. The latter gentleman, who advocates the use of six flies only, is under Mr. Horsley's ban, I suppose, and his opinion on this subject merely "theoretical stuff"! In stating that the "colour of a fly does not die out before it has earned its just reward," I think Mr. Horsley must have been wandering in his mind. As a matter of fact the colour dies out of a fly almost immediately, or very soon after it is put into the water (by that time, I suppose, it has earned its just reward), and this is one of the great arguments against the "many-fly" system.

In conclusion, let me state that it is now three seasons ago since I became an adherent to the three-fly, or rather four-fly system (for I use four only); and far from "keeping the result a profound secret," as I am gratuitously advised to do by Mr. Horsley, I am now convinced that it is as sound a theory as the other one, since I have nearly always equalled and often times exceeded the takes made by my brother anglers. Of course I don't deny that the opposite theory is a good one, also, but mine saves time and trouble, and fly-fishing thereby loses none of its charm for me; but I hold that Mr. Horsley ought at least to allow others to have opinions as well as himself, and not write an angry letter against the theories of people which may be just as good as his own.—I am, &c.,

BLUE DUN.

April 3rd.

FEEDING OF SPAWNING FISH.

SIR,—I don't quite agree with your correspondent, Mr. William Bailey, when he says fish never bite, only when they are in condition. For instance, roach will take the fly off the weeds, they are at the same moment depositing their spawn on; and chub will take the locust on the very gravel they are spawning on, and barbel will take the cod bait when the spawn is running from them, and dace will take fly when rough as a file; and, all the world knows, old kelts will take anything from a spoon to a knife or fork.

Nottingham.

FISH AND SPORTSMAN'S FRIEND.

AN EXTRAORDINARY INCIDENT.

SIR,—A rather curious incident occurred to an acquaintance of mine while fishing in some private water near here. He was fishing for trout with the worm, and had, as he supposed, hooked a fish, but what was his astonishment in pulling out the line to find, instead, a half-digested frog attached by the leg to the hook. Evidently the fish had taken the frog some time before, and, in swallowing the worm, the hook instead of fastening in his throat, caught the frog's leg.—Yours truly,

A. WELLESLEY WARNER,

Midland Counties' Angling Repository,
121, Broad Street, Birmingham, April 2, 1881.

(We have read scores of curious fish stories, but we think this beats all.—ED.)

A NEW REMEDY FOR PARALYSIS.

SIR,—I see by your paper (which I take weekly) that Mr. Thos. Newton has had an attack of paralysis. As I do not know him, I venture to write to you about what I know from personal experience is a sure cure for the same.

I feel that when any one is aware of that which may be the means of saving valuable lives it is his duty to make it known.

I send you a book about this treatment (it is adopted in most of the French hospitals), which only requires to be tried to make a convert of any sufferer from almost any form of malady, for you will see that it promotes equalisation of circulation and breaks up congestions. And what is disease but congestion?

I can answer for the truth of all the cures given in the book I send, but they are only a very few out of many.

I may just mention that, in my own case, I had been suffering for years with chronic indigestion and nervous prostration and then creeping paralysis, all of which are nearly gone. I have a set of instruments, and use them at home when required.

I caught this season, at Wilstone, a pike of 17½ lb., which I have in my hall.

I trust you will make what use of my communication you think best. I enclose my card.—I am, &c., J. L. G.

[Our correspondent is a clergyman in Buckinghamshire, and the system he refers to is described in a pamphlet published by Mr. Christopher Hindle, 17, High Street, Dunstable, price 2d.—ED.]

FOSTER FUND.

SIR,—I beg to acknowledge the receipt of the undermentioned amounts from the following societies with thanks:—Izaak Walton, £14s. 6d.; Cavendish, 16s.; Walworth Waltonians, 11s.; North Eastern, 10s.; West Ham, 9s. 6d.; Reform, 12s. 6d.; Alexandria, 8s.; South Essex Piscatorial, 8s.; Woolwich Brothers, 6s.; Edmonton and Tottenham, 5s.; Bridgewater Brothers, 4s.; Burdett, 4s.; Alliance, 3s.; Carlisle, 1s. 6d.—I am, &c., R. GHURNEY.

United London Anglers' Central Committee,
Bald Faced Stag, Worship Square, Finsbury, E.C.

CLUB REPORTS.

ANGLERS' BENEVOLENT SOCIETY.

A special meeting was called on Friday evening last April 1, when the draw took place, on the Art-Union principle, for the two paintings presented to the society by Greville Fenwell, Esq., for the benefit of the funds. The amount paid in for tickets was £18 10s. The winning number is 375. The fortunate holder of the ticket may receive the paintings on application to the committee at their next meeting, Friday, April 22, between 9 and 10.30 p.m. The committee beg to thank those anglers and friends who have so kindly responded on this occasion. The tickets of membership to the society become due for the new year on May 1st.—R. GHURNEY, sec.

April 5, 1881.

THE CAMBRIDGE FRIENDLY ANGLING SOCIETY.

The annual dinner of the above society will take place on Wednesday, the 13th instant, at 8 p.m. precisely, when the favour of many members' company on the occasion is respectfully solicited.—W. SUTTON, sec.

April 5.

CANONBURY ANGLING SOCIETY.

The annual supper of the above society took place on Thursday, March 31st, at the Albion, East Road, City Road, and a very excellent repast was provided by the host, Mr. Riches. After the removal of the cloth, Mr. T. Wright, hon. sec., and Mr. Money were voted to the chairs. The usual toasts were proceeded with and drunk with much enthusiasm, "Success to the society, host and hostess," "The secretary and committee." Mr. Riches and Mr. Wright responded, after which commenced the harmony. There were some excellent songs sung by the following gentlemen:—Messrs. Wright, Money, Wood, Thomas, Bennett, Johnson, Webb, Edmonston, and C. Watling, jun. Mr. Thomas gave a few selections on the banjo. Amongst the visitors were the following well-known faces of R. Ghurney, J. Hackett, H. De Costa, C. Watling, jun., and J. Fitch. A vote of thanks to the chairman and vice brought a pleasant evening to a close, 1.30.—W. H. PEARCE.

April 4.

THE DALSTON ANGLING SOCIETY.

On Tuesday, March 29, an important meeting of the members of this society was held at their club-house, the principal business of the meeting being the election of officers for the ensuing year. The proceedings, although very animated, as was to be expected under the circumstances, were conducted throughout in a very decorous and dignified manner. The following is a list of the officers elected:—Chairman, Mr. Legge, re-elected; treasurer, Mr. Eagles, re-elected; delegate to the East Central Committee, Mr. Bunn; and the trustees are Messrs. Richardson and Wainwright, as before; and Messrs. Claydon, Fortercue, Lassetter, Long, and Richardson were elected members of the committee. Mr. Lassetter having expressed his determination not to stand again for the office of secretary, Mr. Malby was elected to fill that position. Owing to the time occupied by these proceedings the meeting was ultimately adjourned until the following meeting night, when other important business will be transacted.—W. L.

HAMMERSMITH UNITED.

On Thursday, March 31st, we had a good muster of members, and after the usual business and the election of two new members, the remainder of the evening was spent in harmony. Among those who entertained the company, the following gentlemen may be mentioned:—Messrs. Hoole, Penney, Toms, Howe, Watts, Franklin, Taylor, Page, &c. It is to be hoped that this will be an incentive to our members to attend in larger numbers.—VORTEX.

THE RICHMOND PISCATORIAL SOCIETY.

At the usual weekly meeting of the above society, held at the Station Hotel, on Wednesday, March 23rd, a fine pike of 15 lb. 10 oz., was sent as a present by Mr. Smith, Curator of Kew Gardens; it was one of those left behind a fortnight ago from the netting operations; it was while the weeds in the lake were being cleared out the fish was seen, and one of the men gave him a crack on the back, so that he should feast no more on the young ducks of Kew Gardens. After some discussion it was decided to have the fish preserved and placed in the museum of the above society, the secretary was directed to write Mr. Smith, thanking him for his present to the Richmond Piscatorial Society. Three new members were elected, making in all eighty-one.

There was a very large attendance of members and visitors at the weekly meeting, at the Station Hotel, Richmond, on Wednesday evening last, having been attracted there to inspect a collection of fish specimens belonging to the members, and intended for the Richmond exhibition, at the Castle Hotel, during the present month. Mr. F. C. Clench occupied the chair, and Mr.

Owen Davis the vice-chair. The energy and determination of these two gentlemen in making the society one of the most popular and largest angling clubs out of London is being eminently carried out. The attendance at the weekly meetings is always large. Every week there are new members elected. The proceedings are conducted in a business-like manner, and not a stone is left unturned to raise the character and position of the society. Amongst the numerous gathering on Wednesday evening last there were:—Mr. Thomas Spreckley, chairman, and Mr. W. H. Brougham, secretary of the Thames Angling Preservation Society; Mr. P. Geen, president of the West Central Association of London and Provincial Angling Societies; Messrs. William Maxwell, Thomas Abbott, G. H. Knevet, W. Baker, J. Bagley, G. Nattrass, H. E. Gaynor, R. A. Rowe, H. W. Staveley, J. H. Ford, G. Lawrence, sen., H. S. Giles, F. A. Crow, J. Munro, Dickenson, A. Millar, G. Lawrence, jun., W. J. Holliday, F. J. Scrutton, F. C. Guido, &c., &c. The spacious club room presented an imposing appearance. The cases of fish were tastefully arranged; the tables were decorated with a profusion of flowers; and altogether the effect was most pleasing. After the ordinary business was disposed of, the remainder of the evening was spent in a jovial manner. There was some first-rate harmony, and sundry speeches by Messrs. T. Spreckley, P. Geen, and others. The attention of Mr. John Munro in supplying the wants of those present was highly appreciated. The Scotch whiskey, for which he is so famous, was in constant demand; and the alacrity with which orders were executed by the young ladies in attendance was of a superior character. The society is fortunate in possessing such accommodation, and this, together with the efforts of Messrs. F. C. Clench, Owen Davis and J. H. Gaunt, in their respective offices of president, vice-president and honorary secretary at the weekly meetings, makes the Richmond Piscatorial Society a permanent fact.—April 8. B.

SIR HUGH MYDDLETON ANGLING SOCIETY.

The annual supper of the above society took place on March 30th. Thirty-four members and friends sat down to a splendid spread provided in the usual sumptuous style by our worthy caterer, Mr. C. P. Flawson, late chef, London Tavern. We cannot give Mr. Flawson too much praise for the able manner in which he tried to please each guest. Mr. H. Crosier, our host and treasurer, supplied the liquors. His port and sherry were highly commended by the company. The club-room is spacious and well lighted, and capable of seating 200 people. I feel sure the members of the above society are well pleased with their new quarters. The remnants of the supper being cleared away, the Chairman, Will Fowler, commenced the harmony with "Will-o'-the-Wisp," which was received with applause. The vice-chairman, Mr. Edward Smith, followed with "Simon the Cellarer" and "The Village Blacksmith." Mr. Stead (formerly "the Cure," but now "the Curiosity") highly amused the members with his humorous songs, &c. Mr. Stead started with a medley; afterwards, "I Love my Love in the Morning" and "The Soldier's Tear." Mr. Charles Allard gave "The Man who first Planted the Vine," and "Jack Robinson"; Captain Dennis, "Nothing like Leather"; Mr. Thomas Allard, "Queen of my Soul" and "The Low-backed Car"; Mr. Lyons, of the Sadlers' Wells Theatre, by special desire, recited "The Battle of Killiecrankie," which was highly applauded; Mr. Mathews gave a nautical song; Mr. Walter Allard sang "The Whale" and "The Bold Cavalier"; Mr. Leo Bonvoisin made a nice little speech upon the advisability of a fine season, &c., and afterwards gave his usual recitation; Mr. Speaight sang "Before the Battle, mother" and "Balaclava's Heights." Mr. Thompson, an old angler of 42 years' standing, made a few remarks upon angling and anglers; how conducive to health was the sport; the picturesque scenery the angler would be sure to meet with in his rambles after the funny tribe would gladden the hearts and eyes of every peaceful disciple of old Izaak Walton. Mr. Thompson afterwards gave his old song, "To-morrow." The chairman then gave his Irish patter-song with great success. During the intervals in the harmony, the society received some substantial prizes. The names of the donors were:—Captain Dennis, P. F. Rebaut, Esq., T. Allard, A. J. Allard, Billings, Edward Smith, Duncombe, Pearce, Coborn, Rogers, Leo Bonvoisin, Speaight, and Thomas. The chairman thanked the visitors for their kind attendance, and proposed their health, coupled with our worthy host, which was drank with musical honours. Thus terminated a very pleasant evening. The next return visit will go to the above society on Wednesday, April 15th, eastern district.—J. CABORN, sec.

CENTRAL ASSOCIATION OF LONDON ANGLING CLUBS.

There was a special meeting of the delegates of clubs affiliated to this association on Friday evening in last week at the Star and Garter Hotel, St. Martin's Lane, Charing Cross, for the purpose of presenting to the Thames Angling Preservation Society a contribution of ten guineas as one of its first recognitions of Thames Preservation. There was a very large attendance on the occasion, presided over by Mr. J. C. Murray, the brother of the gallant hero of Laing's Nek, with Mr. W. Griffiths in the vice-chair. After the transaction of some ordinary business, Mr. Thomas Spreckley, chairman, and Mr. W. H. Brougham, Secretary of the Thames Angling Preservation Society, were introduced into the room by Mr. F. C. Hatfield, the influential treasurer of the association. Their appearance was the signal for an exceedingly warm greeting and hearty applause, and they took up their seats on the right hand side of the chairman. Very shortly after this ovation Mr. C. J. Murray rose and made some complimentary allusions to the work of the Thames Angling Preservation Society which had for so many years laboured so nobly and well in the protection of the Thames Fishery. He felt they were largely indebted to that society for what it had done in the interests of the anglers, not only in the way of Thames Preservation, but in increasing the stock of fish by the netting of private waters. The association had determined upon giving a donation of ten guineas—it was a small amount compared with the magnitude of the society's work—but it must be received as a trifling evidence of appreciation on their part, and as a pioneer to a larger sum on a future occasion. He hoped the time would soon arrive when they would be able to support the other associations in the upper Thames, which had been formed long after the establishment of the one to which Mr. Spreckley and Mr. Brougham are attached, and for the maintenance of which those gentlemen worked so hard. He then handed over to Mr. Spreckley the sum of ten guineas with great pleasure as a willing offering from willing hearts. Mr. Thomas Spreckley, in thanking them for their kind contribution, expressed the happiness he felt in coming amongst them, and assuring them that their support was a great impetus to future operations. He then noticed the work that had been done in reference to the heading up of the dace, as every arrangement had been made, as the state of the river needed, to facilitate their progress upwards, for the complete performance of their domestic duties above.

They had all gone up in undisturbed safety, and after seasons would prove the value of this unimpeded progress, as they all naturally knew before we could have large fish there must, in ordinary nature, be smaller ones. His remarks in reference to the movement as to the assumption of private rights in the Upper Thames were loudly applauded, and he assured them that a meeting of the Common Council at Guildhall, on Monday last, at which he and Mr. Brougham attended, was most favourable to steps being taken to put down all claims which had not the least foundation. The movement was made on behalf of thousands upon thousands of anglers, and not only for their sake but for thousands that were yet unborn. As long as he remained in the position he did with the Thames Angling Preservation Society, they might rest satisfied he should labour for their benefit, and there should neither be stint of time or money with him to make the Thames a noble river for all-round angling. He took from Kew Gardens the previous week nearly one ton of fish for distribution in the Thames for next season's angling, and after again thanking them for their support, resumed his seat amidst loud applause. Mr. W. H. Brougham observed after Mr. Spreckley's exhaustive remarks on the Thames, he felt inclined to roam away from his favourite river and to find himself amongst the anglers representing the Central Association. The room in which they were then assembled gave birth to the West Central Association, and it was the clubroom of the Silver Trout Angling Club, which had taken prominent part in its growth. One of its parents they had then amongst them in the person of his friend, Mr. F. C. Hatfield, whose energy and determination were indisputable, whether in the clubroom or on these occasions, whether in the practice of angling or assisting in a day's netting, he always shone with great brilliancy and displayed the greatest perseverance. It might be said there was no need of the Central Association, but he did not think so. He felt there was room enough for all, and this was substantially proved by the success of the association, some addi-

tional clubs even that night having become connected with it. He trusted it would go on prospering and to prosper, and all the rest would prosper with it. The suggestion of railway concessions was first mooted by him in an article in *Bell's Life*, of June 17, 1871, and he held in his hand a letter from the late Mr. Kingsland, secretary of the Silver Trout Angling Society, asking him to receive a deputation to confer with him on the subject, thus the Silver Trout were then keenly alive to the real object of these associations. Mr. Brougham then referred to some proposed alterations in the present Thames bye-laws, and for which the meeting expressed itself most favourably, and then sat down with enthusiastic applause. The retirement of Mr. Spreckley in order to catch his last train was another signal for immense cheering, which continued during his progress out of the room. Mr. W. H. Brougham claimed permission to propose the health of their chairman, who was evidently the right man in the right place, and after some humorous remarks and some praiseworthy observations to Mr. R. Stebbings, their hard working honorary secretary, and to Mr. F. C. Hatfield, their undaunted treasurer, he concluded by calling upon them to do all honour to the toast. Mr. J. C. Murray, in his reply, referred to the great success of the Central Association, which, he said, was fixed on a permanent basis, and continually increasing in strength. It was now, beyond all doubt, firmly and solidly established. Several other toasts were given, and when that of the treasurer, Mr. F. C. Hatfield, was proposed, it would be impossible to describe the hearty manifestations of good feeling that were exhibited towards him—the cheering was long and loud—and such warm expressions of feeling must, to say the least of it, be highly gratifying to Mr. Hatfield. A very pleasant and harmonious evening was most agreeably spent. It was announced during the meeting that the Association had received additional concessions from the Great Western Railway on tickets to Windsor and Moulshurst, and from the Midland Railway on tickets to Bedford and St. Albans.

SATURDAY, APRIL 16, 1881.

THE NATIONAL FISHERIES EXHIBITION.

EASTER MONDAY, which from time immemorial has been distinguished for its annual election of churchwardens, and in more recent times for its big Volunteer Reviews, will this year earn additional renown as witnessing the first National Fisheries Exhibition held in England. The ancient city of

Norwich, the capital of East Anglia, whose marine fisheries are of such enormous extent and value, and whose vast inland waters are so attractive, has the honour of introducing and welcoming the disciples of Izaak Walton to a feast of fish and fishing-tackle, boats, apparatus, and gear, which may equally intoxicate them with pleasure and invigorate them with information and instruction.

No better exemplification of the great results which may follow upon modest intentions can be afforded than by the exhibition which opens on Monday next. Its originator was Mr. W. Oldham Chambers, of Lowestoft, a devoted pisciculturist, the honorary secretary of the Norfolk and Suffolk Fish Acclimatisation Society; a society which, as its title implies, seeks to supplement the coarse indigenous inhabitants of the waters of Norfolk, such as pike, bream, roach, rudd, and perch, with some of those finer and more delicate varieties at the head of which stand the salmon tribe. But Mr. Chambers, when he suggested a local exhibition, with the laudable object—for this was his practical intention—of developing the system of acclimatisation, cannot have entertained the remotest suspicion that he was destined to be the parent of an undertaking unique in the fishing annals of the three kingdoms. This suggested local exhibition it was proposed to hold last autumn, but the Fates beneficently decreed a postponement till the spring. Meanwhile, that most devoted fisherman, the ubiquitous and inexhaustible member for North Norfolk, Mr. Edward Birkbeck, with Mr. Gurdon, a county member, and Mr. J. J. Colman, one of the members for the city, considered that the sphere of the exhibition might be enlarged, and its aspirations partake of a national, rather than of a local, character. Application was made to the Government, who favourably regarded the proposal, and made a small grant in the shape of medals; whilst H.R.H. the Prince of Wales graciously consented to become the patron of the exhibition and to open it in person, accompanied by his illustrious and ever-popular consort; by his brother, Prince Leopold, and other distinguished personages; the murder of the Czar, alone preventing the attendance of the Duke and Duchess of Edinburgh.

It was originally intended to hold the exhibition in St. Andrew's Hall, one of the noblest municipal buildings in the country, but when even to "the Blackfriars, solemn and grand old nave" was added the adjoining Plain, it was found that the space was wholly inadequate to cover the dimensions of the exhibition. The promoters, therefore, applied to Lieut.-Colonel Boileau, the commanding officer of the 1st Norfolk Rifle Volunteers, for the use of the Drill Hall, a large Tudoresque building of brick and flint at the south-west end of the city, situate at one corner of the Chapel-field Gardens—the old "field" having, within the past two years, undergone a great transformation, and besides its well-designed and tastefully laid-out grounds now containing in the centre a magnificent pavilion exhibited by the well-known firm of Barnard, Bishop and Barnard's, at the Paris International Exhibition. The Drill Hall, however, could only afford accommodation in part for the numerous and manifold exhibits entered by anglers, collectors, and makers from all parts, and an extensive annexe has been projected in the gardens themselves by permission of the Chapel-field Gardens Committee. Mr. Hawes is the contractor entrusted with the building, Mr. Holborn with the decoration, and Messrs. Nevor and Page with the furnishing of the reception-rooms for the Royal visitors. No expense has been spared in making the affair a great success, and the completeness of the arrangements may be inferred from the fact that the exhibition is to be lighted in the evening with the electric light.

The list of patrons and guarantors would occupy too much of our space to give in detail, but it includes dukes, marquesses, earls, the Lord Mayors of London and Dublin, and the Lord

Provost of Edinburgh, civic representatives, and noblemen and gentlemen, to the number of more than 200. E. Birkbeck, Esq., M.P., is the President, and the general committee consists of the following gentlemen, those marked with a * forming the Executive Committee:—R. T. Gurdon, Esq., M.P., J. J. Colman, Esq., M.P., *C. L. Buxton, Esq., *L. O. Howard Taylor, Esq., *J. H. Gurney, Jun., Esq., *R. R. B. Norman, Esq., H. Lee Warner, Jun., Esq., H. Stephenson, Esq., Rev. E. Dowell, E. Field, Esq., W. Brown, Esq., *J. B. Pearce, Esq., W. G. Sandford, Esq., John Gunn, Esq., J. Stanley, Esq., F. Sutton, Esq., F. Norgate, Esq., G. C. Davies, Esq., *E. A. Field, Esq., J. D. Farrer, Esq., *A. J. N. Chamberlin, Esq., *W. S. Everitt, Esq., *Jethro Hornblower, Esq., Prime Warden of the Fishmongers' Company of the City of London, J. H. Crossman, Esq., F. J. Mann, Esq., Hyde Clarke, Esq., D.C.L., V.P.S.A., Edmund Johnson, Esq., E. W. Peto, Esq., E. Jex, Esq., C.C., J. L. Sayer, W. H. Williamson, Esq., G. Stevenson, Esq., C. C., T. Balls, Esq., R. Sayer, Esq., J. W. De Caux, Esq., H. Fenner, Esq., Capt. Coleman, J. D. Thew, Esq., F. Cresswell, Esq., Colonel F. Custance, Captain Feilden, F.G.S., C.M.Z.S., *T. Southwell, Esq., *C. Clowes, Esq., and H. W. Stafford, Esq. The other officers are: Treasurer, G. F. Buxton, Esq.; Hon. Curator, A. J. N. Chamberlin, Esq.; Hon. Commissaire Délégué, Edmund Johnson, Esq.; Hon. Secrétaire, W. Oldham Chambers, Esq.

Having said that an amply sufficient guarantee list has been subscribed, let us now invite the attention of our readers more particularly to the exhibition itself, and its prizes, amounting in value to upwards of £1500, with the £100 worth of medals granted by the Government. The President offers a prize of £25 for the best plan or model of fish-culture established; the Exhibition Committee are donors of numerous prizes for fish-hatching apparatus, appliances, and implements for trawling and drifting gear, nets used in deep sea drift fishing, and for essays on different subjects. The Worshipful Company of Fishmongers of the City of London are very liberal prize-givers. They seek, among other things, to bring out the best approved trawl net, capable of allowing immature fish and refuse to escape therefrom; to learn the best way to improve the breeding of the oyster; and to get some fresh light thrown upon the migrations and spawning of sea fish, as well as the most effectual way of establishing mussel beds and protecting those at present existing for the purpose of the long line fisheries. To sum up the 'general character of the exhibits as entered in the catalogue and received during the week, the exhibition will illustrate the complete history of the finny inhabitants of the waters from their birth, as shown in the hatching troughs of Mr. Capel, Mr. W. O. Chambers (the Hon. Secretary to the Exhibition), Mr. Andrews, Mr. Guy (the Howietoun Fishery), the Marquis of Exeter, Mr. Andrews, of Guildford, Mr. Armistead, of Dalbeattie, and others—to their full development in those magnificent specimens, the trophies of the skill of Mr. Jardine, Mr. Sachs, and many notable Norfolk and Suffolk, as well as more distant anglers. The grand collection of the London Piscatorial Society is exhibited, and we need scarcely say is alone worth a visit. The art and mystery of fish capture are made clear by a multifarious assortment of nets of every description for deep-sea and trawl fishing, including the latest inventions, as well as by full-sized fishing boats and models; amongst the latter being a variety of models of steam fishing vessels, for which Mr. Duff, M.P., and other gentlemen give a prize of £50—and by rods, lines, hooks, and every other imaginable appliance, in which makers from all parts of the kingdom compete. Nor is the social condition of the fishermen themselves forgotten, entries of improved dwellings for them, and improved dresses and life-saving apparatus occupying a satisfactory

amount of space in the catalogue. Perhaps one of the most popularly interesting features of the exhibition will be the illustrations of the aquatic *fauna* of Norfolk and Suffolk, which are to be exhibited in a series of aquaria, specially prepared for the occasion, and furnished with live specimens of every fish, indigenous to the local waters, as well as others that have been acclimatised. The display of preserved aquatic—or rather fish eating birds, for to these the entries have been restricted—are likewise particularly rich and attractive; the two counties being specially favourable for the pursuits of the naturalist as well as the sportsman. Not less so, locally, is the splendid collection of casts of fish, &c., made by the lamented Frank Buckland, which have been allowed to be transferred for the time from their *locale* in South Kensington Museum to the Norwich Drill-hall; and the picture gallery to which Mr. Rolfe, the eminent fish painter, is a leading contributor. Then the Board of Trade have sent the latest improvements in life-saving apparatus with men to exhibit them in operation, whilst the Royal National Life Boat Institution is worthily represented.

Earl Ducie, Viscount Powerscourt, Lord Lovat; Mr. Spencer Walpole, and Professor Huxley, H.M. Inspectors of Fisheries; and Mr. Calcrafft, the Permanent Secretary to the Board of Trade, have been appointed by the Home Secretary to act as Her Majesty's Commissioners; and, in addition to a large number of special money prizes, the Government gold, silver, and bronze medals, and diplomas of honour, to which we have previously adverted, will be awarded by the following jurors:—

CLASS I.—Pisciculture: Lieut.-Colonel F. Custance, C. L. Buxton, Esq., and T. J. Mann, Esq.—Shell Fish Culture: F. Wiseman, Esq., W. H. Williamson, Esq., sen., and W. H. Williamson, Esq., jun.

CLASS II.—Models: J. Vere, Esq., and J. C. Hoad, Esq.—Trawling: E. Jex, Esq., C.C., Geo. Fellows, Esq., and J. Alward, Esq.—Drifting: R. Sayer, Esq., H. Fenner, Esq., and J. Murray, Esq.—Canvas and Ropes: B. M. Bradbeer, Esq.—Inland Fishing Tackle: J. P. Wheeldon, Esq., H. Ffennell, Esq., and J. Barwell, Esq.

CLASS III.—Life-Saving Apparatus, Lamps, Fog Horns, Signalling, &c.: Vice-Admiral Phillimore, R.N., and Captain Prowse, R.N.—Architectural Plans: J. B. Pearce, Esq., and E. Boardman, Esq.—Fish Markets, Fish Curing Establishments, Fish Vans, and Fishermen's Clothing: E. Jex, Esq., C.C., and M. Dunn, Esq.

CLASS IV.—Pictures: James Webb, Esq., and H. G. Barwell, Esq.—Utilisation of Condemned Fish and Fish Refuse as a Manure and Rendering Innocuous Polluted Streams by Sewage: F. Sutton, Esq., F.I.C., F.C.S., and P. P. Marshall, Esq., C.E.

CLASS V.—Dried, Salted, Smoked, and Tinned Fish: R. Sayer, Esq., H. Fenner, Esq., and E. Seaman, Esq.—Shell Fish: F. Wiseman, Esq., W. H. Williamson, Esq., sen., and W. H. Williamson, Esq., jun.—Fish Oils, Manures, and Disinfectants: F. Sutton, Esq.—Aquatic Flora and Fauna and Birds that Prey upon Fish: Rev. E. W. Dowell, J. J. Gurney, Esq., jun., and H. M. Upcher, Esq.

CLASS VI.—Loans: C. L. Buxton, Esq., J. Vere, Esq., and E. Bidwell, Esq.

We turn now to the imposing ceremonial that may be anticipated on Monday.

The Prince and Princess of Wales, Prince Leopold, and the other distinguished visitors, will enter the city at noon by the Thorpe Railway Station, the more frequented of the two railway entrances to Norwich. The mayor and sheriff and other civic dignitaries will, as a matter of course, be in attendance to offer the formal but hearty welcome. But this will by no means repre-

sent the more brilliant part of the pageantry. The military will be represented by a guard of honor, consisting of the local volunteer corps and an escort of the 3rd Hussars, now stationed in the city. Received and accompanied in this fashion, the Prince will once more traverse what he must now regard as the familiar route to the Drill Hall. For the visits of his Royal Highness have been neither few nor far between, and more than one local event—from the founding of a new hospital to the opening of an annual cattle show—has been graced by his presence and honored with his patronage. Let us take a glance at the line of streets through which he will pass, for it is replete with objects of interest and attraction. The Royal party will leave on their right the charming suburb of Thorpe, with its picturesque residences, breezy heights, and its well-wooded copses, between which flows the devious stream of the Wensum. The entrance to the city will be by the Foundry Bridge, a perilously-narrow structure which exists as a reproach to our railway company and a wonder to the outside world. Passing along Prince of Wales-road—finest and broadest of Norwich streets, and the scene of many a loyal welcome in the past—the Prince and Princess will come in full view of the Castle, strikingly situated on an eminence and overlooking the Cattle Market. The castle is a Norman structure, and, with its lofty position, imposing castellated front, and massive architecture, makes a grand centrepiece to the city buildings. The Cattle Market—now partially closed owing to the outbreak of cattle disease—is every Saturday a scene of busy life, and, during the great annual fair held in the present week, is crowded with many thousand head of sheep and cattle. But the *cortege* then enters Bank Plain, the principal objects in which are Messrs. Gurney's old establishment and the fine new restaurant known as "Cooper's." In London Street, the next thoroughfare traversed, the signs of the "improving" spirit of the age at once become manifest. Old Norwich is, in fact, disappearing, and a fine modern city is springing up in its stead. Wood pavements take the place of the abomination known as "petrified kidneys," and handsome shops and wholesale establishments stand where, at one time, everything was dingy and old-fashioned. From London Street Prince and party will pass on to St. Giles Street, skirting the noble square, which serves as a market place, on their way. Directly in their line of route lies the Guildhall—the seat of the corporation and magistracy, and the battle-ground of many a tough party fight on "Mayor's Day," the 9th of November. St. Giles Street—another fine thoroughfare—leads to the Drill Hall, where, of course, the real work of the day will begin.

The Royal party will be received at the Hall by the president, Edward Birkbeck, Esq., M.P. An address will be presented and replied to, the exhibition will be opened, and their Royal Highnesses, after making a tour of inspection, will proceed to St. Andrew's Hall, to be entertained at a *dejeuner* by the Mayor. This will conclude at once the work and the pleasure of the day, and the Royal visitors will leave for Sandringham at four o'clock in the afternoon.

As we write, these arrangements in connection with the great exhibition are being rapidly pushed forward. Workmen are busily engaged in bringing the Hall and the annexe up to the required state of completion and adornment, and the spaces allotted to the various exhibitors are now nearly all occupied. The police arrangements and traffic regulations will be all that can be desired, and nothing will be left undone to ensure the success of the occasion. Special efforts have been made by the Great Eastern Railway Company to meet the convenience of passengers travelling from the metropolis. On Easter Monday, in addition to the ordinary service, a train will leave Liverpool Street station at 8 a.m., will arrive in Norwich in time for the opening ceremony, and will return to London by 9 p.m. Tickets at single

fares will also be issued for the double journey, and tickets of admission to the exhibition may be purchased at Liverpool Street. Strangers and visitors will, we think, be assured of a cordial welcome, and a pleasant sojourn in the old city during the twelve days for which the exhibition will remain open. The beauties of the Cathedral, the historic associations of St. Andrew's Hall, and the archæological remains in which Norwich abounds, will provide ample material for enjoyment and reflection to the seriously-inclined. The angler will find ample opportunities of enjoying his favourite sport on some of the picturesque broads of the Bure or North River, and the quiet reaches of the Yare and Wensum. The lover of nature will be more than recompensed by a visit to the beautiful hamlet of Thorpe—"the Richmond of Norwich,"—and for the pleasure-seeker pure and simple, Yarmouth, Lowestoft and Cromer will furnish all that he can well desire.

M. GAUCKLER ON PISCICULTURE.

THE French have distinguished themselves by several excellent works on the science of pisciculture, the latest of which has just been published by M. Gauckler, who was for ten years at the head of the famous fish-breeding establishment at Huningue. His book embodies not only the results of his own experience and studies at Huningue, but also contains a condensed account of what has been done in France and other countries to improve and develop the art of fish-culture.

Pisciculture has been practised from the most remote antiquity. Two thousand years before the Christian era, there were laws in China regulating the periods for collecting fish eggs for artificial incubation; and even at that early date they appear to have had recourse to processes similar to those practised in our own days. In India, Persia, and Egypt, natural and artificial lakes were used for fish culture; and among the Romans artificial fish-hatching was carried to great perfection. Lucullus, that celebrated patron of luxury and extravagance, had a mountain pierced through, and a canal constructed in order to admit the sea-water into his vivaria or fish-ponds. Varro enlarges on the advantages of economic fish-ponds, and describes fresh and salt water tanks for fish cultivation. Many of the owners of these ponds appeared to have derived a considerable revenue from them. Sergius Orata made a fortune by turning fishmonger on his own account, and assumed his second name from the popular fish (orata)—a favourite side dish on the tables of the rich—which had raised him to wealth. C. Hirrius, the first who established ponds for lampreys, derived from them an annual income of £4800; and several other proprietors who had sunk capital in fish-ponds found them by no means a bad investment. The Romans occasionally brought fish from a great distance for the purpose of stocking their preserves; but in general their fish-ponds were supplied with species caught in the immediate neighbourhood. A well-known Latin writer tells us that they turned lakes and rivers into natural vivaria by carrying to and depositing in them not only fresh-water fish, but also the spawn of all those species of sea fish which are in the habit of penetrating some distance up rivers and estuaries; and he mentions several rivers, such as the Velinus, Sabatinus, and Volsinius in which the experiment had been successful. The Romans were very fond of fish, and the rich and luxurious among them sometimes gave enormous sums for their favourite delicacy. The mullet was held in great esteem, and the seemingly incredible prices of £48, £64, and even larger sums, are said to have been paid for a single choice fish. To be rich, in short, and not to have the best fish on your table was to be without taste. A Roman named Cassiodorus sold his slave in the morning that he might sup on a lamprey in the evening; and Veditius Pollio caused offending slaves to be thrown into the ponds where his

lampreys were kept. A broken decanter or a shattered dish sent a slave to be food for fishes, till Augustus, on the complaint of a slave doomed to feed the lampreys, caused the fish-ponds to be filled up, and Pollio's stock of glass and crockery to be smashed on the spot.

The title of M. Gauckler's book is "Fresh Water Fish and Pisciculture" (*Les Poissons d'eau douce, et le Pisciculture*). The first part, of about 100 pages, consists of descriptions and plates of fish, beginning with the salmon and ending with the lamprey; while the second, nearly twice as long, treats of Pisciculture. This science has for its objects the multiplication of the most useful kind of fishes, and it also aims at introducing and propagating them in waters where they have not previously existed. In order to carry out its objects, various processes are necessary, such as the stocking of waters by the introduction of adult fish capable of reproducing their species; rearing in fish-ponds; the collection of the spawn which fish deposit in the natural way, and its transference into the waters which it is wished to stock; the appropriation and adaptation of streams to the different kinds of fish by the formation of spawning beds and places of refuge, by the construction of fish ladders, and by the extermination of their natural enemies; artificial breeding, in which man intervenes and assists in the fecundation and incubation of the eggs, and afterwards in sheltering and watching the young fry. To these various piscicultural processes M. Gauckler devotes several chapters.

Almost from time immemorial, fish have been transferred from the rivers and waters of one country to those of another. To this we owe the introduction of the carp, now so common in Europe, which originally inhabited the waters of Persia and Asia Minor; of the gold-fish, a native of China; and of the shad, which was brought, about a hundred years ago, into the rivers of North America, where it had not previously existed. The choice of new species, however, requires great care and discretion; and the introduction of such fish, for example, as the *silurus glanis*, which some have proposed to bring into the rivers of France and Great Britain, would be a great mistake, as it is exceedingly voracious, and its flesh of only mediocre quality.

M. Gauckler has an interesting and instructive chapter on fish-ponds. The celebrated Lake Mocris, in Egypt was a vast fish-pond, which served at once for irrigation and fishing. In ancient India, many tanks were constructed and stocked with fish. The Romans, as already mentioned, were famous for their love of fish and fish-ponds. The monks of the middle ages were great fish cultivators; and in France at the present day there are about 500,000 acres occupied by fresh-water fish ponds, without counting the rivers and lakes. In Austria and Bohemia, also, large tracts of country are covered with artificial pools. The district of Wittengau alone has 250 of them, occupying about 1,200 acres, which have been used for supplying fish for 600 years. Bohemia at one time had no fewer than 22,140 fish-ponds, but now has not above a third of the number. Northern Germany possesses a great many; and in the single domain of Peitz-Cottbus there are 82, which produce annually about 220,000 pounds weight of marketable carp.

M. Gauckler gives many useful and practical details concerning the position, the soil, and the water most suitable for fish-ponds; the formation of the dams that retain their waters; the various apparatus used for emptying them; the construction and dimensions of the *poele* or *pecherie*, that is the part of a pond sunk below the general level to which the fish retire when the waters are drawn off; and the precautions to be taken in severe frosts and sudden thaws.

Some fifteen pages are devoted to an account of fish-ponds for rearing carp, the fish which has most generally and for the longest time been thus cultivated. The carp is a hardy and very prolific

fish. It grows most rapidly during the first four years of its existence, after which its growth is much more gradual. At four years old it commonly attains the weight of 4 lb.—a good marketable size. Dame Juliana Berners mentions the carp in England in her book on angling, published in 1486. It is there stated to be a dainty fish, but to be scarce, and to be so strongly armed in the mouth that no weak harness may hold him. In this country 12 or 15 lb. is considered quite an exceptional size for a carp; but in warmer climates he attains to a much greater weight. In the German lakes carp have been caught from 20 to 30 lb. In Prussia 40-pounders are not unfrequently heard of; Pallas speaks of one taken in the Volga which measured 5 feet; Valmont de Bomare of another, served at the table of Prince Conti at Offenburg, weighing 45 lb.; and a monster is said to have been caught in the Oder, near Frankfort, in 1711, of the incredible size of 9 feet long by 3 deep. Jovius speaks of carp in the Larian lake (Como) weighing 200 lb., which were assailed by arrows shot from a cross-bow, or by harpoons with lines attached. The carp possesses great tenacity of life, and occasionally attains a great age—according to some writers, 200 years. The following extract from Mr. Buckland's "Familiar History of British Fishes" will give some idea of how extremely prolific a fish the carp is:—"I have a fine cast," he says, "in my museum of a carp, lent for this purpose by Mr. Charles, of Arabella Row, Pimlico. This fish weighed 21½ lb. I have since, by carefully weighing the roe, discovered by average that it contained no less than 1,310,750 eggs. Another smaller fish, which turned the scale at 16½ lb., contained roe which weighed 52 lb., giving the total of 2,059,750 eggs. These weights and calculations were made by a professional accountant."

Fresh spring water, and a gravelly, rocky, or sandy bottom are most suitable for trout ponds, which should be bordered with trees to give shelter and coolness, and from whose foliage numerous insects, the favourite food of trout, will drop into the pond. Instead of flat banks, with a gradual and regular slope to the water, the sides of the pond should be irregular and broken up by fragments of rock, roots, and stumps of trees as places of retreat and shelter for the fish. On the bottom of the pond, too, artificial inequalities and refuges should be formed. It is of great importance, before stocking a pond with young trout, to make sure that it contains neither pike, nor perch, nor minnows, nor sticklebacks, nor predatory insects. The trout in the same pond should be as much as possible of the same size. If there be great difference in size, the larger will devour the smaller. If trout are to attain a weight of 2 lb.—a good marketable size—there should be three separate basins, each of which should contain trout of the same year. The depth of the pond for the trout of the first year should be from 18 to 20 inches; for those of the second year, at least 3 feet 4 inches; and fully five feet for those of the third. Under the most favourable circumstances with regard to the abundance of pure and well-aerated water, and the supply of food, a great many trout may be reared in a comparatively limited space. A pond between 60 and 70 feet in length, from 18 to 20 in breadth, and from 5 to 7 feet deep, can easily accommodate several hundred three-year-old trout. The stocking may be carried the length of two or three fish for every cubic yard of water. The plants best fitted for trout ponds are those which encourage most the production of insects and their larvæ, which they prefer to all other kinds of diet, and on which they thrive best. A special apparatus for affording a supply of such food has been invented in the United States.

M. Gauckler's closing chapters treat of the transport of the young fry and of the enemies of fish. In transporting fish, two conditions should be specially attended to with reference to the water in which they are conveyed—namely, a suitable tempera-

ture and sufficient aeration. The water in which the young fish has been brought up ought to be used in preference to any other during the process of transport, and various means may be employed for replacing the oxygen consumed in the course of the journey. Several forms of apparatus have been tried for securing the safe transport of fish; but that which M. Gauckler prefers, and which, he states, has always given the best results, is that constructed by M. Biennet, which has been in use in Huningue since 1865, and in which even large salmon have been conveyed without damage for hundreds of miles. He gives several drawings of this apparatus, and an elaborate description of it, which, however, is too long to quote. In the transport of fish, the water, though it should be aerated at intervals, should not be renewed, because the new water might be different in chemical composition from that to which the fish had been accustomed, and might possibly cause a mortality among them. We should also be careful that the air which we inject into the water has not been vitiated by deleterious emanations or by tobacco smoke. A very small quantity of these poisonous fumes is sufficient to destroy the young fry. Those charged with their transport should, therefore, carefully avoid smoking carriages. For success in this department of pisciculture, as in every other, the great point is to multiply precautions, and not to neglect the smallest detail. In fact, the true practical rule may be summed up in a few words:—"Attention, attention, and still more attention." The result will amply compensate any trouble that may have been taken.

At the head of the enemies and destroyers of fish, M. Gauckler places the otter, one of which, he says, will destroy, in a single night, half a dozen carp of a couple of pounds weight each. In the next rank, he places the heron, one of the boldest and most successful robbers of streams and fish-ponds. No doubt the heron is a daring and prosperous fisher, but we never before heard that he had stored up within him an infallible means of fascinating and attracting the fish on which he feeds. M. Gauckler tells us that M. Noury, puzzled by the sort of madness which brought the fish to the very point of their enemy's bill, inquired into the matter; and proved that the heron has certain glands in his body from which he can exude a fluid which, on contact with the air, becomes a bluish powder, very fine and unctuous, and of an exceedingly fetid odour. This powder, by a peculiar movement of the heron's body, is shaken into the water, and slowly descends the stream where he is fishing. Its smell has an indescribable attraction for the trout; and scarcely have they felt it, when they begin to ascend the stream to seek for its source, add so fall an easy prey to the voracious heron. Poachers, M. Gauckler tells us, have long been aware of the peculiar attraction for fish which this heron odour possesses; and they compound heron oil, with which they anoint their baits. They prepare it in the following way. They pluck the heron without gutting him, and pound him in a mortar. The paste thus obtained is preserved in a bottle, hermetically sealed, from fifteen to twenty days in a warm place, until it becomes a sort of oily pulp. Any fragments of bone are then separated from it, and the remaining paste is mingled with flour, honey, or bread, and is carefully kept, in well-corked phials, until the moment arrives to smear with it the hooks and baits which are to be used in fishing.

In the United States and in Canada, the great importance of pisciculture is recognised as a means of increasing the stock of fish in rivers and lakes, and counteracting the effects of bad seasons, destructive modes of fishing, and other causes of decline; and in both countries, establishments for fish culture are supported by the Government, who have not been slow to appreciate the advantages to be derived from them. In Scotland, too, though nothing has been done by Government, we are glad to say that artificial fish-breeding is on the increase. Besides the Stormont-

field ponds, which have been in operation for more than twenty years, there are now the extensive hatcheries of the Duke of Sutherland and the Marquis of Ailsa, as well as several others on a smaller scale in different parts of the country; while Sir James Maitland's establishment at Craigend, near Stirling, is the most complete in Europe, and is, year by year, being extended and perfected. Illustrations of the various processes and apparatus in use in these hatcheries would form one of the most interesting departments of the fisheries exhibition which we hope to see held in Edinburgh, in the Waverly Market, in the spring or early summer of next year.—*Scotsman*.

NOTES AND QUERIES.

RARE AND CURIOUS FISHES OF DEVON.

SPINOUS SHARK.

Squalus spinosus

Turton's Linnæus.

Squale Bouclé

Lacepede.

„ „

Risso.

Echinorhinus spinosus Yarrell, British Fishes, vol. ii., p. 534.

ACCORDING to Couch, vol. i., p. 54, the spinous shark was not known to naturalists before the latter end of the eighteenth century, and at present little more is ascertained concerning it, besides the figure and the extent of sea through which it is distributed. Dr. Smith obtained it at the Cape of Good Hope; it seems scarcely rare in the Mediterranean; and in Britain it has been taken in Yorkshire, and Brixham, and three or four times in Cornwall. Its haunts, probably, are in very deep water, and consequently little of its peculiar habits can be expected to become known, except by some fortunate accident of uncertain occurrence. We must rest content, therefore, in collecting what scattered notices exist, with the addition of the very little obtained by observation. Mr. Charles Fox met with one that was taken towards the end of September, 1835, near Helford, in Cornwall, about a mile from land. Risso speaks of a specimen so large as to weigh about six hundredweight.

On March 7th, 1872, I received a magnificent specimen of the spinous shark from Brixham, this being one of the most curious fish I had yet seen, and the first of its kind. Knowing full well how pleased my friend Mr. Buckland would be to see it, I immediately telegraphed to him; an answer was quickly returned to this effect, "Pray send me the spinous shark as soon as possible." It was accordingly sent, and a splendid cast taken of it by Mr. Buckland, and is now to be seen in his Museum of Economic Fish-culture, South Kensington, S.W.

Mr. E. Parfitt, in his "Fauna of Devon," page 42, gives an excellent description of this particular fish, viz., that three specimens of this almost world-wide distributed fish have been taken on our shores. Two of these have been mentioned by Mr. Yarrell as having been taken in trawl nets off Brixham, and the other was hooked off Berry Head. The third one I saw at Mr. Gosden's, fishsalesman, High Street, Exeter; this was captured off Brixham, March, 1872. The form of this specimen was very much like the one figured by Mr. Yarrell at page 54, long and thin. Length, 5 feet 3 inches from apex of snout to tip of fleshy part of tail; breadth of head, from eye to eye, 7 inches; width of tail, 1 foot 2 inches, from tip of nose to anterior base of pectoral fin 14½ inches; from apex of nose to anterior arch of mouth, 5½ inches; transverse diameter of mouth, 6 inches.

FRANK GOSDEN, Exeter.

GEORGE JAMES EATON, of Starkholmes Matlock-Bath, Derbyshire, respectfully invites Noblemen and Gentlemen to try his standard FLIES for the present season. No flies sent or made up but what he himself has proved sure killers. A trial is all that is required from gentlemen who can fish to prove whether they may be genuine or not. Patronised by some of the best fishermen of the day. All flies dressed on the best Kendal hooks. Prices: Point Flies, 2s. 6d. per Dozen; Dropper Flies, 2s. per Dozen. Orders punctually attended to.—[ADVT.]

RIVER REPORTS

MID-THAMES.

"I know a bank where the wild thyme blows,
Where ox-lips and the nodding violet grows."
—SHAKESPEARE.

I know a great many of such banks, beside old Father Thames, where not only oxlips and violets may be gathered, but beauties of a more substantial character in the shape of trout, may be gathered by patient toiling and spinning. A grand change for the better has taken place in the weather, the river is perfection with regard to trout condition, and the troutist that now hesitates to visit some favourite haunt will be lost—it is now or never on the Thames, for it is useless to hang fire until the "madding crowd" has scared every respectable fish into unfishable quarters.

THURSDAY EVENING.—I have many interesting items to communicate with regard to trout doings within the past week, but your "special notice" has taken me off my feed. I had altogether forgotten Good Friday, but, with all my heart and soul, I trust it may prove a good Friday to all brother piscators; so, until next week, "o-river."—MARLOW BUZZ.

Thames (Goring).

Water very low and clear; we had a lot of rain here on Monday night. Prospects look better; wind in a better quarter, south-west. There have been a few trout taken round about here at Pangbourn; 8 trout were taken, largest 3 lb., at Newbury; a trout was taken, 8 lb., on the Kennet; a large trout has been feeding here last week, at Gatehampton Ferry.—JOHN RUSH.

Barle and Exe (Dulverton).

At last we have some fishing weather, after a long period of frost and cold north-east winds, with these rivers very low. However, last Sunday a change came, wind veering round to the south, and a gentle rain fell for twelve hours, which was not only received thankfully by agriculturists, but also anglers, and caused these rivers to be in fair order for fishing. At the present moment of writing they have got very low again (the few hours of rain not being sufficient), but it looks very likely for a change, and in the bad way the fish sported to-day indicate such; with more rain the water will be in first-rate order. Very good baskets have been made during the last two days. Baskets have averaged from from twenty to thirty trout in each. On Monday, I caught twenty-one, and on Tuesday twenty-two, average-sized fish, with small the blue upright, silver twist and sand-fly. I am sorry to see there are otters about, and I am sure we (anglers) would be pleased to see our old friend Mr. Collier bring up his grand otter hounds at his very earliest convenience, as he generally has a few pleasant days on the Barle and little Exe.—W.

Bure (Acle).

CAPTURE OF A FINE EEL.—A magnificent specimen of the stream eel, was taken at Acle last week, by Mr. Rose, landlord of the Bridge Inn, weighing 7 lb. and some odd ounces; the mode of capture being a small roach for bait on ordinary eel hook. This fine fish is still alive, and will probably be shown at the forthcoming Fisheries Exhibition. Mr. Rose informs me that owing to the absence of salt tides during the last few months, some good fishing may be expected here, as soon as the weather became more settled.—ANGLER.

Coquet (Weldon Bridge).

On March 31st, Mr. Foster, of Brinkburn, killed 2 trout, one 25 inches long, and 15½ inches girth, one over 7 lb. and the other 2½ lb., and 3 salmon; Mr. Mathews, 1 salmon and a dish of trout; Mr. Hedley, of Felton, 5 salmon; Mr. Dobson, of Felton, 4 salmon; Mr. Wood, of Lindon, 2 salmon and a dish of trout; Mr. Hilton, 2 salmon and a dish of trout; Mr. A. Hutchinson, of Bockesfield, a splendid dish of trout; Mr. Leighton, of Theslyhaugh, 6 salmon, from 2 to 9 lb. weight.—A. GLASS.

Fareham (Hants).

Trout fishing has commenced in this neighbourhood, but the takes are small, and owing to the cold spring fish are not in very good condition. Mr. E. Goble, the secretary of the Titchfield Club, fishing near Romsey, caught a fine salmon weighing over 25 lb., with a small silver-bodied fly.—RED PALMER.

Medway (Tunbridge).

The water is in splendid condition, but as we have no trout worth speaking of, no angling can be done at the present time. The dace have finished spawning, and the jack and perch in large numbers have been seen in the spawning beds during the week. The prospects for the coming season are most encouraging.—YE MEDWAY WATER RAT.

Yore (Yorkshire).

I am happy to say that we have entered upon spring weather at last—weather calculated to raise the fly-fisher's hopes, and make his heart feel light, at least so mine feels at the present time at the prospect of a clear week's good fishing. If the present weather continues great will be the slaughter of trout throughout England during Easter week, and many a golden monarch of the streams will flap his tail in his native element for the last time. I recommend the water cricket for point fly, sand fly for the second dropper, and blue dun and march brown for third and fourth, but of course neither I or any other angler can tell what fly will really kill until we get to the river side.—FRANCIS M. WALBRAN.

THE NATURAL HISTORY OF THE EEL.

By J. HARRINGTON KEENE.

(Continued from page 137.)

I PROMISED some further remarks in my article of March 19 on the above subject, and as during this comparatively "off season" the matter may be interesting, I proceed to fulfil the promise.

That, after this, no one of my readers may be in the least doubt as to the mode of generation in eels, I will take this branch of their natural history first. I have before me at this moment a private letter from a prominent American fish-culturist (on the United States Fish Commission), in which the following passage occurs:—

"Professor Baird has five specimens [of eels] with ovaries in the Smithsonian Institution. Professor Packard found a male and found spermatozoa, and I counted some eggs, and from that estimated the number in a 6 lb. eel as 9 millions."

Taking this as accurate—and I know my correspondent's scientific ability too well to doubt it—the 11½ lb. eel in Mr. Buckland's museum at South Kensington would represent about 18 millions of ova. (It is the cast of a female *anguilla mediostriis*—a silver eel.)

The probable reason why the ova and milt of the eel so long escaped detection in the animal was the expectation of finding appearances similar in a close degree to those of other fishes.

The likeness, however, is but slight; and, indeed, in some particulars, even distant. Two long, narrow sacs, continued beyond the vent, and throughout the entire length of the abdominal cavity, consist of membranes, secreting on the inner surface the milt of the male, and affording attachment, as in other fishes, for the ova of the female. They are, in the words of Jesse, "puckered or gathered along the line of junction to the peritoneal covering of the spine, and the free, or loose, floating edge, is therefore thrown into crevices or plaits like a frill." This writer, through Professor Owen, had an opportunity of seeing some drawings belonging to the collection of John Hunter, in which the peculiarities of the sexual organs of the eel were beautifully shown.

From the calculation referred to above, it is clear that the eggs of the eel are of microscopical minuteness. Indeed, one moment's glance at the convoluted fringe containing them is sufficient to show that the largest is scarcely definable by the unaided eye, and the smallest utterly undiscernable without high magnifying powers. The varying size lends itself to the supposition that the ova is shed continuously as it matures. According to Couch, "some of the tiny globules were a hundred times larger than others from whence the conclusion is that some are approaching maturity, and that their exclusion is in succession." I am of opinion that, during the winter season, the maturing process is arrested, and that it is in early spring that eels spawn in salt and brackish water, and in summer in fresh water.

The eel fare, or elvers, in earlier times so plentifully seen on the Thames, consisted of a dense, wriggling dark mass of tiny eels, making their way upward from the lower reaches of the river. This is seen to this day near Worcester, and other places on the Severn. At the Faithful City these tiny fish are mixed with a little flour and spice and baked, forming a sort of eel-cake, which is exceedingly delicious but very rich. Mr. Eden (Museum of Fish-culture) pointed out some of these cakes to me the other day, which were preserved in spirits; and, though cooked, they presented every indication of the nature of their composition. No such eel fare is observable in land-locked waters, as the young eels bury themselves in the soft ooze or traverse its immediate surface, feeding on the smaller annelids or mollusca, as well as the smaller crustacea and larvæ of insects.

It may tend to lessen the tediousness of somewhat dry ichthyological details if I recount some of the extraordinary accounts of the genesis of this fish, which have gained credence. Even now, it seems, there is a marvellous amount of ignorance existing on the subject. It is only a few weeks since our editor was asked if eels would be engendered by horse-hair soaked in water! "Might not such a popular superstition," writes Dr. Badham, of this very common belief, "have originated the singular tresses of Medusa?" These were composed of snakes, as all my readers are aware. Oppian thought the mud engendered eels, so did Aristotle. Pliny opined they rubbed themselves against the rocks, and that from the detritus issued a new generation. Other ancient naturalists ascribed them to celestial agencies making them the offspring of Jove and a white-armed goddess, Anguilla. Van Helmont, in later times, believed they came from May dew, and that they might be engendered by the following process: "Cut up two turfs covered with May dew, and lay one upon the other the grassy side inwards, and thus expose them to heat of the sun. In a few hours there will spring from them an infinite quantity of eels." Rondelet professes to have *seen* eels embrace, and Leuwenhoek, in the urinary, and Vallanieri in the swim, or air bladder, assert they found eel fry. The eel-lets, or elvers, are very light-coloured at first, but become greenish-brown later in the season.

Although I have not said as much, the attentive reader will have seen that in the matter of generation, I am inclined to the opinion that there is no difference from other fishes in the mode. It has been asserted that those species which are migratory spawn only in the sea, to which they make their way every autumn. Mr. Pinkerton says, that the sharp-nosed eel is migratory, and the broad-nosed species is not. This opinion he very substantially backs up from his experience of Irish eel-fisheries, and he would be entitled to his deduction being accepted as a fact were it not for the trifling circumstance that my observations in respect of English eel-migration are almost oppositely opposed to him. I have found the broad-nosed eel in certain localities to predominate over the other species, and quite as persistent in their efforts to pass down stream as their sharp-nosed congeners. Dr. Roots, of Kingston, held that the migratory eels (meaning all the species of the Thames) made two migrations each year, namely one up, and we may presume, one down, like the salmon; and, where this is possible, I am inclined to think his opinion a true one.

(To be continued.)

FISH CULTURE AT CHERTSEY BRIDGE.

I am very glad to find that your correspondent "Consistent" has considered it worth his while to notice my remarks in reference to "Fish Farming at Chertsey Bridge," although he is not altogether correct in all his conclusions. In speaking of "Mr. Forbes being actively engaged in the culture of various species of salmonidæ," he is not to infer that my idea is at all favourable to the introduction of foreign fish into the Thames. I have never spoken in favour of it, but at all times strongly advocated, instead, the increase of our own native fish, and particularly what is known as the Thames trout. I have all along considered it a mistake to propagate the different species of salmonidæ which was first taken up by the late Mr. Frank Buckland for the Thames, and afterwards carried on by his worthy successor Mr. James Forbes. I think "Consistent" is unnecessarily sharp in charging me with jumping at conclusions in regard to the hatching of the Thames trout; and he must know as well as I do, that the first, and most important stage of success, is in the character of the ova; and at the time I wrote upon the subject, the eggs were fast approaching vivification, and now, when I saw them last week,

they had satisfactorily passed into active life. I had, therefore, occasion to be sanguine in this respect, and I am so far sanguine of the ultimate result, that even if only one sixth of the young fry are raised to a good size for turning into the river, it will be a grand gift to our noble Thames. The arrangements that are being made at the present time to bring about such a result have never been adopted before, and when the time comes for placing the young fry in the rearing pond, I shall be in a better position for detailing the particulars. I hope then "Consistent" will feel that, instead of looking forward to disappointment, which is no principle of mine, there will be every chance of success: It is no use looking on the dark side of any question. Our hopes should always be bright and cheerful. Nothing to me in this life appears difficult. If there is a difficulty, it should be grasped, and it will be overcome. I look forward to success in everything I undertake, and so far I have never been disappointed. I am satisfied that the cultivation of the real Thames trout may be safely and satisfactorily carried on. Every one knows that there are great risks in the raising of the fry, and great care is needful in bringing them up—and if we can only get through the period of infancy, I do not anticipate—neither will I anticipate—the difficulty of raising a goodly proportion of the youthful stock. I only wish "Consistent" could see for himself at the present time the thousands of young fry in the fish-house at Chertsey Bridge! he would take a more cheerful view of what our good friend, Mr. James Forbes, is doing in the way of fish-culture. I lay no claim to "a gift of sacred prophecy,"—I look forward to hope, and it will carry me onward—not resting on hope alone, but that which leads up to it—the duty which is attached to the work in which we are engaged; and if the plans that are now arranged for future operations are rightly carried out, in the course of two more years the result will manifest itself. I may not be spared to witness it, but others may, "Consistent," I hope, amongst the rest; and he may, perhaps, then, with some satisfaction, exclaim "after all, 'B.' was right." Whether it may be so or not, I trust he will feel with me at the present time I am not using words in any bitterness of spirit, and I can, in return, assure him I do not regard anything of aggression in his remarks. I rather value correspondence written in a kind and courteous manner, whether I am differed with or not. We have all a right to private judgment, and I am not so wedded to notions as to be above being convinced.

B.

ANGLERS should always be provided with something to take away the swelling and poisonous effect of the bites of insects. They should also have with them something to apply to a cut or sprain. Pond's Extract reduces the swelling and inflammation, stops bleeding and pain, and hastens the healing process in case of any wound or sprain; and it has no equal for application to the bites and stings of insects. Therefore never go on a fishing excursion unprovided with a bottle of Pond's Extract. It is for sale at all chemists, at 2s. 3d., 4s. 6d., and 8s. 6d. per bottle.—[ADVERTISEMENT.]

TIED HANDS AND ARMS.—Edson's Electric Armlets and Wrist Bands. Invaluable for anglers and gun sportsmen and highly recommended for all persons having tiresome writing, sewing, or music practice. They give wonderful energy and strength, enabling the wearer to accomplish tedious work with steadiness and comfort. Price 2s. 6d. per pair, silk web and fine steel clasps. Sent to any address on receipt of P.O.O. payable to J. Edson, the Electric Fabric Co. Patentees, No. 1, Charlotte Street, Bedford Square, London W.C.—[ADVT.]

TO ANGLERS.—W. J. Cummins, Fishing Tackle Maker, Bishop Auckland, is now prepared to forward to anglers his Illustrated Catalogue, which is not only a Trade List but is interspersed with practical hints, useful directions, and valuable information gathered by the river-side from twenty years' experience. The stock consists of his unrivalled Salmon, Trout, Grayling, and Pike Rods, Lines, Reels, Baskets, Artificial Baits, Fly-books, Landing Nets, Gaffs, and last, but not least, his celebrated Trout Flies, which for killing powers stand unequalled. Every article kept in stock is of the very best description.—[ADVT.]

GREGORY'S SPINNING BAITS.—"The Gregory," the "Flexible Cleopatra," the "Oxford," and the "Colorado," pronounced by all Anglers and the Press the best baits invented for salmon, trout, pike, and perch. To be obtained from all respectable fishing tackle shops in the world, and wholesale from Messrs. S. Allcock and Co., Standard Works, Redditch. Flattering testimonials speaking of the efficiency of the baits have been received from the Right Hon. John Bright, M.P.; Mr. William Bailey, Nottingham; the Rev. E. C. Holt, Teddington; Sir William Calder, Kingston-on-Thames, &c. Gregory's registered Archimedean spinning tackle for pike and trout, now ready, is pronounced by the press the best ever invented. For use with dead bait. The tackle is complete in every respect, and can be adjusted to suit bait of any size. Has been tried with remarkable success.—See that the name "Gregory" is impressed on the Archimedean fins, as inferior imitations are offered for sale, and people are thereby disappointed and deceived. Address, James Gregory, Vyse-street, Birmingham.—[ADVT.]

BLUE POINT OYSTERS.

A FEW days since, I purchased from Mr. Gow, fishmonger, Broad Street, some Blue Point oysters that he had been feeding, for a period of four weeks, in the English beds at Colchester, and I am now able to report with satisfaction on the result. I found the oysters very fat—in fine condition—and thoroughly clean. I can strongly recommend them, and the prejudice I had against Blue Points has been thoroughly overcome by this process of cleansing and giving them a more wholesome flavour. Mr. Gow is, therefore, deserving of support, and the price is wonderfully moderate.

B.

FISH AS FOOD.

THE researches of German and American chemists into the character of fish as food have disproved many of the commonly accepted theories about its extraordinary qualities, especially its value for the building up of the brain.

According to their investigations there is no evidence to prove that the flesh of the denizens of the river and sea is any richer in phosphorus than other meats, and that, even if it were so, there is no proof that it would, on that account, be more valuable for brain food, as the nourishment of the brain and the sources of intellectual energy are too abstruse in the present condition of knowledge to enable persons to arrive at any positive conclusion.

Some one asked Mark Twain, when he was editing a weekly paper in California, how much fish he ought to eat in order to improve his brain, and the humorist replied, through the columns of the journal, that he could not exactly tell, but, judging from the character of the inquiry, that seven or eight dozen whales might have some effect on him.

Dr. J. W. Draper, of New York, has, evidently, no belief in fish as brain food, for he says: "Since during the acts of sensation and intellection phosphorus is consumed in the brain and nervous system, there arises a necessity to restore the portions so consumed, or, as the popular expression is, to use brain food. Now, as every one knows, it is the property of phosphorus to shine in the dark, and as fish is a certain stage of putrefactive decay often emit light or become phosphorescent, it has been thought that this is due to the abundance of phosphorus their flesh contains, and that they are, therefore, eminently suitable for the nourishment of the nervous system and an invaluable brain food. Under that idea many persons resort to a diet of fish and persuade themselves that they derive advantage from it in an increased vividness of thought—a signal improvement in the reasoning powers. But the flesh of fish contains no excess of phosphorus, nor does its shining depend on that element. Decaying willow wood shines even more brilliantly than decaying fish. It may sometimes be discerned afar off at night. The shining in the two cases is due to the same cause—the oxidation of carbon, not of phosphorus, in organic substances containing, perhaps, not a perceptible trait of the latter element. Yet, surely no one found himself rising in a poetic fervour by tasting decaying willow wood, though it ought on these principles to be a better brain food than a much larger quantity of fish."

According to other scientists, people who eat fish largely may, after awhile, approach Homer, Socrates, Tacitus, Juvenal, Virgil, Dante, Milton, Shakespeare, Macaulay, and other celebrated writers of the past in intellectual power, but they will learn in the course of time how fallacious are such fancies.

One thing may, however, be said about fish, and that is, that while it is much cheaper than meat, the better kinds are almost equally as nutritive; and are well adapted as food for all classes, but especially the poor, who have no money to waste on the mere pleasing of the palate, and only eat to live. And, as cheap and wholesome food is necessary to the progress, culture, and even morality of a people, it follows that fish is an important factor in our national welfare.

The taste for fish advances with civilisation, a fact which is apparent when we consider the attention now paid to sea and river fisheries, and the largely-increasing quantities of fish caught each year. It is estimated that London alone disposes of 80,000 tons annually, and that Paris and New York use at least as much more, making a total of 160,000 tons for three cities.

The Americans are greater fish eaters than the Europeans, and as they have many species in their waters, they are able to have fresh fish the year round. They seem to have inherited the taste of the Ancient Romans for fish, for we learn that some Roman nobles paid as high as 2,560 sesterces, or twenty pounds, for a single lamprey eel, and from twelve thousand to twenty thousand

sesterces for a six-pound mullet, and considered only the livers and gills of these creatures fit to set before a king. We also learn that they sent ships to foreign countries for the finny denizens of the deep; that they built ponds for breeding the freshwater species at home; that they fed them with veal soaked in human blood, and even with the remains of slaves sacrificed specially for that purpose.

Fish contains more water than beef, mutton, or pork, and the fatter it is the less water it contains. Thus fresh eels, trout, salmon, and shad are more nutritive than cod, halibut, flounders, and others, because they are fatter. Ere referring to the nourishing qualities of different fishes, it may be well to explain what the nutrients of food are, so that their character may be readily understood. These nutrients are divided into albuminoids, carbohydrates, and fats, each of which has its own specific work in supporting life.

The albuminoids, for instance, are nitrogenous, that is, they contain carbon, oxygen, hydrogen, and nitrogen, and are, therefore, the most important; for not only do they help in the formation of the fatty tissues of the body and in the supply of animal heat and muscular power, but they have a work of their own to perform in building up the nitrogenous tissues, muscles, cartilages, and tendons, in which none of the other substances, or ingredients, can share. We find the albuminoids in the gluten of wheat, the white of eggs, the serum of the blood, lean meat, and curd.

The carbohydrates are non-nitrogenous, and are made up of carbon, oxygen, and hydrogen. They are found in starch, sugar, and cellulose, and are supposed to be employed for the purpose of supplying fuel to produce animal heat and muscular power. Although they are important constituents of food, they are inferior to the fats and albuminoids.

The fats, which are also non-nitrogenous, occur in butter, fat meat, lard, tallow, linseed oil, olive oil, and other vegetable substances. These are mainly useful for storing fuel in the body, by giving the flesh the required amount of fat to sustain animal heat. The albuminoids are considered to be the flesh formers, and the other two nutrients the respiratory substances; but all these, undoubtedly, take part in producing muscular energy and respiration. It is evident from this that persons would starve in a short time if they depended solely on carbohydrates and fats, though they might live for days, if not weeks, on lean meat.

It is a well known fact that savages who live for any length of time on lean meat become so fond of fats that they will swallow raw oil without suffering any ill effects from it, and will eat fat raw pork as ravenously as a starving man would a piece of bread. Now the flesh of fish, like that of other animals, consists principally of albuminoids and a small portion of fats, but no carbohydrates; and as vegetables contain the latter nutrients, and only little of the others, it follows that a combination of meat, fish, and vegetables make the most wholesome and agreeable diet.

Professor Atwater, of the United States, has recently been analysing the nutritive qualities of various species of fish found in American waters, and from his researches we learn that they are far more watery than one would expect. He says that in a hundred pounds of cod, only one-sixth is composed of solids, but the solids amount to a third in the dense and lordly salmon. The following table will give an idea of how the species stand in order of merit.

In flesh of—	Water, per cent.	Solids, per cent.
Flounder	82.8	17.2
Cod	83.1	16.9
Cod	82.4	17.8
Striped bass	78.7	21.3
Striped bass	79.6	20.4
Bluefish	78.1	21.8
Halibut (lean)	79.4	20.6
Halibut (fat)	69.3	30.7
Mackerel	77.8	22.2
Mackerel	74.2	23.8
Shad	69.3	30.7
Shad	64.5	35.5
Eels (salt water).	70.4	29.6
Whitefish	69.6	30.4
Brook trout	75.7	24.3
Lake trout.	68.7	37.3
Salmon	66.4	33.6

These figures prove that the lake trout, the shad, the salmon, fat halibut, and salt water eels rank before all their congeners in nutritive qualities, and that, with few exceptions, fishes that feed on the bottom are not so good as those that frequent the upper waters. A good quality of lean beef, free from bone, contains about 75 per cent. of water, while fat beef contains as low as 55 per cent.; so that the difference between meat and fish is not very great. To judge from this, the person who would prepare fish extracts in

the same manner as beef ought to make a fortune in a short time.

To show how fish compares with other foods in nutritive qualities, I give the following table, which has been compiled with great care by Dr. König, of Germany, and Professor Atwater :—

COMPOSITION & VALUATION of ANIMAL FOOD. (Flesh free from bone.)	Ingredients.				Nutritive valuation compared with medium beef—100
	Water.	Albuminoids, Protein.	Fats.	Extractive matters, Mineral Ingredients.	
MEAT.					
Beef, lean	76.71	20.61	1.50	—	1.18 91.3
Beef, medium	72.25	21.39	5.19	—	1.17 100.0
Beef, fat	54.76	16.93	27.23	—	1.08 112.0
Veal, fat	72.31	18.88	7.41	.07	1.33 92.4
Mutton, medium	75.99	18.11	5.77	—	1.33 86.6
Pork, fat	47.40	14.54	37.34	—	0.72 116.0
Smoked beef	47.68	27.10	15.35	—	10.59 146.0
Smoked ham	27.98	23.97	36.48	1.50	10.07 157.0
GAME, FOWL, &C.					
Venison.	76.76	19.77	1.92	1.42	1.13 88.8
Hen	70.06	18.49	9.34	1.20	0.91 93.9
Duck	70.82	22.65	3.11	2.33	1.09 104.0
MILK, EGGS, &C.					
Cows' milk	87.41	3.41	3.66	4.82	0.70 23.8
Cows' milk, skimmed	90.63	3.06	0.79	4.77	0.75 18.5
Cows' milk, cream.	66.41	3.70	25.72	3.54	0.63 56.1
Butter	14.14	0.86	83.11	0.70	1.19 124.0
Cheese, skimmed milk	48.02	32.65	8.41	6.80	4.12 159.0
Cheese, fat	46.82	27.62	20.54	1.97	3.05 151.0
Cheese, very fat	35.75	27.16	30.43	2.53	4.13 163.0
Hens' eggs	73.67	12.55	12.11	0.55	1.12 72.2
FISH.					
Flounder	82.85	15.24	0.62	—	1.29 65.0
Halibut	74.31	18.20	6.38	—	1.12 88.0
Cod	82.78	15.67	0.34	—	1.25 68.0
Eels	70.44	18.66	9.80	—	1.00 95.0
Shad	66.93	19.19	12.51	—	1.36 99.0
Striped bass	79.13	17.59	2.13	—	1.14 79.0
Mackerel	76.02	18.28	4.60	—	1.09 86.0
Bluefish.	78.15	19.33	1.25	—	1.27 85.0
Salmon	66.41	19.72	12.71	—	1.10 104.0
Haddock	80.63	18.03	0.18	—	1.16 78.0
Lake trout	68.69	17.70	12.26	—	1.35 94.0
Brook trout	75.70	19.92	3.02	—	1.36 91.0
Whitefish	65.59	21.66	7.14	—	1.61 103.0
Red snapper	75.45	22.40	0.67	—	1.48 97.0
CURED FISH.					
Salt mackerel	48.43	20.80	14.40	0.38	16.27 111.0
Dried cod	16.16	78.91	0.78	2.59	1.56 346.0
Smoked herring	69.49	21.12	8.51	—	1.24 104.0

We deduce from these figures that beefsteak is about three-fourths water, and milk seven-eighths; so that a pound of the former contains only four ounces of solids, or about as much as a quart of pure milk. The difference between both as food is very great, however, and for the simple reason that the meat is mostly composed of albuminoids, which sustain life, while the milk consists of fats and carbo-hydrate, or sugar of milk. According to certain German chemists, beef is the most nutritive of substances, yet there is not much difference between it and fish, except that the latter have less fats. One pound of albuminoids is said to be equal to three pounds of fats; hence, if we take medium beef at 100, the following will be the ratios of other substances:—Milk 23.8, butter 124, medium mutton 86.6, fat pork 116, smoked been 146, flounders 65, cod 68, shad 99, whitefish 103, salmon 104, dried cod 346.

Fish is, therefore, almost as nutritive as meat, especially that which is dried or smoked, while it only costs one-third or one-half as much, and, what is more, it is always palatable. Why persons should waste so much money on beef and mutton is a mystery, and can only be accounted for on the ground that they do not know the value of fish as food, or that they have not educated themselves to appreciate it.

A careful survey of the preceding table will enable the prudent housewife to see which species of fish are the best and the most

economical for food, and if she does not pay for those which please the palate rather than those which are best fitted to sustain life, she will find that she can support her family much cheaper and better by buying fish occasionally than if she spent her money on meats alone.

NATURAL HISTORY.

(Continued from page 84.)

HERRING FAMILY.

WE come next to twelve specimens of the gizzard shad, whose minute fry swarm in countless numbers in the waters of our larger rivers in midsummer. These were taken in June and July from the Illinois river, from Ottawa to Peoria. The smallest of the group twenty mm. long by two mm. wide—as slender as cyprinoids and nearly cylindrical, although the adult is a high, thin fish. I was greatly interested by the discovery that the maxillaries of these smallest specimens are provided with teeth—a single row of nine or ten on the lower edge—although the mouth of the adult is entirely toothless and smooth. The internal structure also differs remarkably from that of the adult, especially in the much greater simplicity of the digestive apparatus. In a young gizzard shad, seven-tenths of an inch long, by one-tenth of an inch high, the intestine was found to pass almost directly from the anterior end of the stomach to the vest; and at this time pyloric cœca was entirely wanting. The intestine of this specimen was filled with various species of entomostraca.

On the other hand, in a fish three and three-fourths inches long, showing the general characters of the adult, the intestine passed upward and backward from its origin, running without flexure the whole length of the body cavity (this part being covered with an immense number of pyloric cœca) then turned forward to the stomach, and made a large number of intricate turns and doublings from side to side and end to end of the abdomen, extending in all to about eight times the length of the perivisceral cavity. This intestine was well filled with mud with only a slight sprinkling of unicellular algæ.

These twelve fishes, all under two inches, had eaten about 90 per cent. of entomostraca, 2 per cent. of chironomus larvæ, and the remainder, algæ.

MINNOW FAMILY.

A single minute minnow, three-eighths of an inch long, which I could not determine specifically, had eaten entomostraca (25 per cent.) and chironomus larvæ.

Three specimens of the common chub minnow (*Semotilus corporalis*), ranging from five eighths inch to one inch, indicate somewhat doubtfully an exception to the general rule respecting the early food of fishes. Only 7 per cent. of their food was entomostraca, and the whole remainder consisted of filamentous algæ. It should be noted, however, that 20 per cent. of the food of the smallest specimen, five-eighths inch long, was cyclops, and it may be that the chub minnow lives wholly on entomostraca at first, merely changing its habit earlier than most of its allies.

CATFISH FAMILY.

Numerous specimens of the young of this family show that, notwithstanding its many peculiarities of structure and habit, it is no exception to the general rule respecting the food of the young. The smallest of these specimens were from a little school of minute fry, taken in June from the friendly protection of an old oyster can in the Illinois River. These little creatures were colourless and seemingly almost helpless, and only three eighths of an inch in length. They had already begun to eat, however, and their stomachs were filled with entomostraca and chironomus larvæ. These were certainly *Amiurus*, but it was, of course, impossible to tell the species.

Other specimens of this genus, making thirteen in all, none longer than an inch and five-eighths, were obtained from various places in the Illinois, and from mud holes in the Mississippi bottoms in Union County. These thirteen individuals were feeding almost wholly on entomostraca and larvæ of chironomus, the latter composing 74 per cent. and the former 18 per cent. of their food. A few young amphipoda and a few unknown insects' eggs account for the remainder of the food.

No specimens of *Noturus sialis*, varying in length from seven-eighths of an inch to an inch and a quarter, differed from the foregoing in the much larger proportion of chironomus larvæ (41 per cent.) and in the 26 per cent. of young *Allorchestes dentata* (a very abundant small amphipod), eaten by the larger specimens. These had also taken 7 per cent. larvæ of May flies. Those under an inch in length were peculiar only in the large ratio of chironomus larvæ (65 per cent.), a fact probably indicating that this species seeks its food chiefly on the muddy bottoms.

Six specimens of the other genera of catfishes were taken small enough to show their earliest food, but as far as can be judged from the food of four specimens of *icialurus*, from two and a half to three and a half inches long, the other genera will not be found to differ especially from the foregoing.

DOGFISH FAMILY.

A single dogfish (*Amia*), one and three fourths inches long, taken in June, had eaten 70 per cent. of entomostraca and 2 per cent. of larvæ and pulpæ of chrinomos. A few young allorchestes and some water bugs (*corixes*) complete the brief list.

Several specimens of *amia* under one inch in length, whose anatomy I studied three years ago, I remember to have had their intestines packed with entomostraca.

CORRESPONDENCE.

We do not hold ourselves responsible for opinions expressed by our Correspondents.

WHO MAKES CUPS FOR CLUB PRIZES?

SIR,—In reply to Mr. John Hargrave's question for the above I beg to say that Mr. W. B. Payne, of Castle Street, Bristol, is the best place to obtain a silver cup, or any other present suitable for a prize.—I am, &c.,

LEWIS WRIDE
Secretary to the Bristol Golden Carp Angling Association.

FOSTER FUND.

SIR,—I beg to acknowledge, with thanks, receipt of following sums towards the above fund:—Marylebone, 14s. 6d.; Duke of Norfolk, 10s. 6d.; Bostonian, 10s. 6d. The list is now closed.—I am, &c.,

T. HOOLE, hon. sec.

THE ALEXANDRA FLY.

SIR,—I should feel obliged if you, or any of your correspondents would kindly give me their experience of the Alexandra fly as a trout killer. My attention has been called to it several times in your *Gazette*. Where can it be obtained?—I am, &c.,

A TWO YEARS' SUBSCRIBER.

Gloucester.

[We believe that several of the London fishing-tackle makers, whose advertisements will be found in our paper, keep this deadly fly for trout; and we know for certain that Mr. Bowness, of the Strand, London, keeps a very good pattern in various sizes. The method of using the fly is to throw across and down stream, and then to draw the fly in a series of gentle jerks against the current. As we have before said, we are certain that the fly is taken for a minnow, and it looks exactly like one in the water. It will also kill if worked like a salmon fly.—ED.]

FISHING AT DAGENHAM.

SIR,—Will you kindly allow me space to ask your readers the following questions?

- (1) Is fishing allowed at Dagenham during the fence season?
- (2) Which fish are likely to be in the best condition?

—I am, &c.,

A.

EDITORIAL CORRECTION.—In last week's article, "Flam on the Dove," should have been "Ilam on the Dove."

CLUB REPORTS.

THE BERMONDSEY BROTHERS ANGLING CLUB.

The above club have their third annual supper at the Club House, Alscot Arms, Alscot Road, Bermondsey, on Tuesday, April 12.—I am, &c.,

WM. ALLEN, sec.

BOUGHTON ANGLING CLUB.

The members of this club held their annual dinner at the Portobello Inn, St. John's, on Monday evening, when Mr. J. Gillam presided, and the company included, amongst others, Mr. T. Davis (vice-chairman), Messrs. W. Tandy, C. Newman, Hopkins, A. Bosward, J. A. Griffin, J. R. Pool, J. Deakin, A. Shaw, J. R. Bunn, H. W. Carey, J. R. Bosward, and J. Chambers. The capital repast prepared by Host Griffin having been done justice to, the loyal and patriotic toasts were proposed by the Chairman, who next gave "Success to the Boughton Angling Club." He congratulated them on having enrolled so many efficient members during the short time the club had been in existence, and hoped that during the coming season their ranks would be further augmented. Mr. J. R. Pool responded, and said the club started very prosperously, and was going on in the same way. The number of members was nearly 30, and as there was a prospect of others joining, he had no doubt but that they would have a good season. He hoped next year that the prize list would be a more lengthy one. The Vice-Chairman proposed "The Presidents," a toast to which Mr. Griffin said it gave him very great pleasure to respond. When he accepted the post of president, he did so with a determination to see whether it was not possible, with all the good anglers in St. John's, to have a club in connection with the parish which should be second to none in Worcester. His friends had rallied round him, and he was pleased to be able to say that their united efforts had met with success. They had not had many fish weighed in, as the rivers had been all against angling, and for the last six months he did not think they had had a nine days' water. The object of the club was the furthering of the interests of all anglers, and the protection of fish. It behoved all anglers to do all they could to protect the salmon, though in doing this they should not ignore other fish. To the working classes angling was both a profitable and enjoyable pastime. Last year 4000 licenses to fish in the waters of the Worcestershire and Shropshire fishery district were taken out, and he thought the Severn Fishery Board might well do something towards providing enjoyment for those who paid license money. (Hear, hear). Mr. Deakin proposed "The donors of prizes," which was acknowledged by Mr. Bunn. "The Committee" was proposed by the Vice-Chairman, and responded to by Mr. Hopkins, who said the club was in a good financial condition. He hoped the members would do all they could to further the interests of the club. The other toasts were "The visitors" and the "Host and Hostess." Songs were given by Messrs. Gillam, Pool, Miles and Bosward; Mr. J. J. Bateman presided at the piano, and Mr. W. Wainwright played the piccolo. Mr. Caldicott's new "Sleigh Race Galop" was given, with the accompaniment of bells. The prize for the heaviest aggregate weight of fish taken up to the commencement of the close season was awarded to Mr. Hopkins, and the prize for the heaviest one day's catch to Mr. Deakin, of Malvern, who weighed in 10½ brace of trout and grayling.

THE CADOGAN ANGLING SOCIETY.

The first annual supper of the above society was held on Thursday last at the Prince of Wales, Exeter Street, Sloane Street, when a most excellent bill of fare was provided by our hostess, and thoroughly done justice to by thirty

members and friends, including Mr. Bonvoisin, of the W.C.A. After the removal of the cloth, the distribution of prizes having unfortunately to be postponed, a most pleasant evening was spent. Some pleasant harmony, in which Messrs. Rickets, Heads, Smale, Olliver and Fawcus were most prominent. Also a recitation by Mr. Bonvoisin, whose company we were very sorry to lose so early, he having promised to attend the Hammersmith Angling Club's return visit, which took place the same evening. It is intended to distribute the prizes on Thursday, the 14th, when all members are requested to attend. The principal winners are Messrs. Smale, Spring, Pike, Seeley, Goodger, Hemson and Tilley. We have had a fairly prosperous season, and, with several new members joining, look forward to a better one next. Some handsome prizes standing over to commence the season with.—April 11. W. ROBSON.

NORWICH PISCATORIAL SOCIETY.

On Tuesday evening last a general meeting of the above was held, about forty members being present. After the election of fresh members had taken place, the Rev. W. H. Matthews, B.D., Chairman of the Club, gave a short but deeply-interesting lecture, the subject being "Life Amongst the Red Indians," this being a sequel to his former one, "The North American Indians; the Modes of Fishing, and Various Species of Fish." The rev. Chairman having had considerable experience with many tribes during his missionary course, and during which he must evidently have studied and watched their habits most minutely, made many interesting statements in reference to their peculiar customs, habits, and legends. Speaking of the Arthabascans, or Chippewas, who live between Slave Lake, Bear Lake, to the Arctic Circle, they are divided into many branches, some—for instance, the Hare or Slave tribes—are in condition wretched, have no huts, live principally in open air, and dress in hare skins; and their chief diet is fish, mostly speckled trout, which abound there in abundance, also the cat fish (Songas), lump fish (Canamas), and salmon (Meugos). Also the Dog Kill Indians, who dress in reindeer hides, anything but active in their habits; their territory is from Nelson River to Deer Lake, fish also forms a considerable portion of their food. The Tahkali, or Carrier Indians, are tall even to grossness, especially the women, lazy and filthy. These Indians often make attempts to destroy their children, even before birth. They used to burn the corpse of a man upon a wooden pyre, then place the wife upon it until she was burned in many parts and nearly suffocated; after the man's body was consumed the wife would have a bag made from skin given her, filled with ashes from the remains, these she carried with her for three years, at the end of which a pole daubed over with dark clay and ochre was erected, on its top the bag of ashes was placed, and there lay until the pole rotted away. The woman is then free to marry again, having been treated rudely and severely by her relatives, and made to do the most menial duties they could enforce upon her. Other Indians living in Oregon territory regard the spirit of a man as living separate from the body, and the Salish tribe holds that it can be so parted for a short time without death. Salmon abounds much in this district, and the Indian reason for such is this:—The Salish always considered the wolf to have supernatural powers. This animal came to their tribe and asked for a wife, and in return would give them salmon; they assented. The wolf went to another tribe with the same demand, they also agreed; but when he reached the Arthabascas they refused; the wolf told them they should have no salmon in their territory, and raised the Spokane Falls across the river, thus preventing the fish leaping over them. The Arthabascas are a yellow, swarthy class, with high cheek bones, small grey eyes, dark brown hair, some have grey eyes tinged with red. Speckled trout is there in abundance with the white fish, similar to the bream. The Chippewas are very expert fishermen, diving into the vast rapids with a small wicker net upon a pole, and rarely failing to bring up fish from the deep parts of the boiling stream. Pickerel, or pike, are also to be found in great numbers around this Manitoba territory, as are also the lucker, a grovelling fish, always caught upon the bottom, attaining a weight up to 8 lb. White herrings are caught in the vicinity, and in the great lakes of Huron and Erie by shoals. The Sioux Indian inhabit the parts chiefly at the foot of the Rocky Mountains and the prairies, and are divided into various breeds; one band, the Mandans, are similar to half-breeds, especially the women, of pleasing symmetry and proportion of figure, large grey, blue or brown eyes, with a mildness and sweetness of expression, blended with an excessive modesty of demeanour. To this tribe there is a peculiar freak of nature, nearly one out of every ten have grey or white hair. The men are so ashamed of it that they disguise the colour by mixing ochre or clay with it, whereas the women are proud of the same; frequently it hangs below the knees. The other tribes of Sioux are a warlike class, and are ever and anon engaged in plunder with other tribes, principally the Blackfeet and settlers. The Chinuks are most deserving of notice as fishermen. They possess rather a peculiar aspect, from the fact that when young they have a pad bound tightly across their foreheads, in consequence of which their heads are almost flat. Living as they do contiguous to the Pacific Ocean (north), after daubing their faces with soot and red clay in peculiar patterns and designs, together with the bone ring worn through the septum of the nose, they put out from shore on their fishing exploits in their canoes, and oftentimes catch the whale, which they bring to shore, and make use of nearly the whole of it. From such daring exploits they are the best fishermen amongst the whole race of Indians. After having given a most graphic account of the Blackfeet, Creeks, Iroquois, and other tribes, the rev. Chairman concluded. His peculiar humour kept the members spellbound until he terminated, when an unanimous vote of thanks was accorded to him, one and all heartily sorry he could not exhaust his subject, hoping he will give them another lecture when his numerous engagements will permit. We might add this Club augurs well to be the first in the Eastern counties.—ANGLER.

TUNBRIDGE ANGLING CLUB.

A committee meeting of the above club was held in the Bull Hotel on Monday evening, under the presidency of Mr. T. Ellicott, of Tunbridge Wells. A large amount of business was done, the secretary reporting that the consignment of 1000 carp presented by Edward Canzalet, Esq., of Fairlawn, was placed in the river, and were doing well. It was determined to appoint a sub-committee to confer with the secretary and draw up a code of rules to form a weighing-in club in connection with the society.—YE MEDWAY WATER RAT. April 12.

UNITED LONDON ANGLERS.

The Midland Railway Company have granted to the United London Anglers' Association, on the production of cards of membership, tickets from Moorgate Street, Kentish Town and St. Pancras to the following stations:—Elstree, Radlet, St. Alban's, Harpenden, Chilton Green, Seagrave, Harlington, Flit-

wick, Amptill, Bedford, Oakley and Sharnbrook. Available for return on the day of issue or either of the two following days. The tickets originally were granted only from St Pancras.—R. GHURNEY.
April 12.

WEST CENTRAL ASSOCIATION—No. 1 DISTRICT.

The return visit of angling societies was held at the Golden Barbel on Tuesday evening, April 5th. Mr. L. Bonvoison occupied the chair, faced in the vice by Mr. W. Packman. Considering the exceedingly short notice given, the attendance was exceedingly fair, and when the roll was called, shortly after eleven, by Mr. Osmond, the district officer, it was found that ten societies were represented, viz:—Cambridge, Duke of Cornwall, Golden Barbel, Hammersmith, Norfolk, North Western, Prince of Wales, Waltonians, Cavendish and St. John's Wood Piscatorial. Some capital songs and recitations from Messrs. Dixie, Packman, Penney, Chambers, Harrison, Shergold, Smart, Lumley, Robson, Staples, Blackmore, Lane, Sanson, together with some spirited operatic selections by that clever little instrumentalist, J. Stanton, made the evening pass agreeably. A vote of thanks to the chairman and vice terminated the proceedings.—L. B.

THE WOOLWICH PISCATORIALS.

On Monday last the members of the above had their annual dinner at their club house, the Cricketers' Arms, Sand Street, Woolwich. The room was nicely decorated with flags, cases of fish, pictures, &c., some of which were lent by the members and their friends. The tables were ornamented with very choice flowers, &c. A splendid dinner was served up by our worthy host, Mr. Thomas Howlett, and it was done justice to by all present. A private band played the whole time. After grace Mr. Page took the chair; Mr. C. Howlett vice. After the loyal toast, the "East, West, and Central Associations" were given, followed by the toast of the evening, by Mr. Jones, "Success to the Woolwich Piscatorials," which was responded to by Mr. H. J. Belstead, the secretary, who said that it gave him very great pleasure to be able to inform them that the society is in a very prosperous state, that the number of members has greatly increased, and that there are sufficient funds in hand to meet every claim, and to give some prizes for the coming season. "The Visitors" was given by Mr. Bowles, and responded to by Mr. Biggs in a very praiseworthy manner. "Our Worthy Host" was given by Mr. C. Howlett, and responded to by Mr. T. H. in his usual good-humoured style. Mr. Blakeborough of the Hoxton Brothers presented the prizes. The first, an armchair, given by Mr. T. Howlett, and won by Mr. H. J. Belstead; second, a dozen ivory-handle table knives and forks, given by Mr. C. Howlett, and won by himself. The honorary member's prize, a carving knife and fork and cruet, given by Mr. C. Howlett, won by Mr. Page. Three prizes, given by Messrs. Bowles, Jones, and Belstead, were not taken; they will be fished for on the 19th June, at Dagenham. During the evening several prizes were given for the ensuing season. Some excellent singing by Messrs. Page, Lewis, C. Howlett, Franks, Summers, Barber, Jones, Belstead, Neale, Biggs, and others enlivened the evening, which closed with a vote of thanks to the chairman.

SOUTH-EASTERN RAILWAY EASTER ARRANGEMENTS.—On the South-Eastern Railway all express and ordinary return tickets for distances over 10 and under 50 miles, including those between London and Beckenham Junction, the cheap return tickets between London and Westenhanger, Hythe, Sandgate, Shorncliffe, Folkestone and Dover, issued on April 14th, 15th and 16th, will be available up to April 20th. Return tickets for distances under ten miles, and those for distances over fifty miles, will be available for the usual time. The cheap Saturday to Monday return tickets to the seaside, issued on April 16, will also be available to return up to and including the following April 20th. On Good Friday and Easter Monday special excursion trains will run from London and New Cross to Dover, Folkestone, Shorncliffe, Sandgate, Hythe, Westenhanger, Ashford, Margate, Ramsgate, Canterbury, Minster, Sandwich, Deal, Hastings, St. Leonards, Tunbridge Wells, &c.

THE CLOSE TIME FOR FISHING.—The committee and some of the members of the Birmingham Piscatorial Society met at the Grand Hotel, Birmingham, on Monday evening—the two local conservators of the river Trent, Mr. Allan Bagot and Captain Willoughby Wood, being present—to consult as to the close time to be observed on that portion of the river, Trent at Alrewas rented by the society. Mr. Oliver Pemberton presided. Last year, the Conservancy Board, under the powers vested in them by the Freshwater Fisheries Act, granted an extension of the close time to May 14, but this year they refuse any concession, and therefore the Act must be adhered to. It is the desire of the club to abide by the wishes of Lord Lichfield, the proprietor of the water, as well as those of the conservators, but they feel that they are by an arbitrary Act being deprived of their fishing at one of the best periods of the year, as the spawning season for roach, dace, and chub in the Trent will certainly not commence for another month. The opinions of some of the best anglers throughout the Trent district, obtained very recently, is that a general close season is not applicable to all rivers, and that in this respect the Mundella Act is a mistake. In so far as the prevention of the sale or exposure for sale of freshwater fish during the close time is concerned, the Act has worked beneficially, as it has stopped the netting by poachers, which did more mischief than the rods of all the anglers put together. No doubt the Trent Conservators are right in their desire to see the Act carried out in its strict integrity, but some allowance should be made for climatic influences in different localities, so that the legitimate sport of true anglers who have no desire to infringe the law may not unduly be interfered with.—*Birmingham Daily Post*.

THE COCKSPUR WORM.—This noted bait is found in old rotten manure and is about 1½ inch long; it has a small ring half a inch from the head, and a gilt tail, with no stripes whatever, but when well scoured in damp moss for a few days is of a perfectly pink colour. The brandling and another blood red worm are to be frequently found in the same manure, but neither of these is to be compared with the cockspur, or, in fact, nothing like it, for, as I have said, the cockspur has a gilt tail. For the information of your correspondent last week I will inform him that so far as trout fishing goes it is the best bait we have for winter fishing, and will kill in any depth of water where the places can be fished with a quill float.

GRESHAM ANGLING SOCIETY.—The general meeting of this society, of which Lord George Hamilton, M.P., is president, has been announced for seven o'clock on Thursday, May 5th, at the City Larder, 19, Throgmorton Street. We are sure our readers will wish success to a society so important to anglers as this seems likely to become.

STOUR FISHERY ASSOCIATION.

The general annual meeting of this Association was held at the Fountain Hotel, Canterbury, on Saturday, March 26th, under the presidency of the Rev. Cyril Randolph.

The accounts showed that after discharging an extra outlay upon the fish preserves, the balance in hand of last year was nearly maintained; and it was resolved that the subscription of last year, namely, three guineas for members fishing above Canterbury, and one guinea for those fishing below Fordwich be continued, and that each member be allowed to issue six visitors' day tickets during the ensuing season.

Captain Lambert, the Honorary Secretary to the Association, reported that he had been in communication with George Bowdler Gipps, Esq. (now in Egypt), who had agreed to continue to members of the association the same privilege which his late father had granted of fishing through the Tnannington Estate on payment to the funds of the association of an extra subscription of two guineas.

It was unanimously resolved that the number of fishing members subscribing three guineas per annum be limited to 40, so that there is only opportunity for three vacancies to be filled during the present year.

After some conversation upon the loss of Mr. Frank Buckland as a member of the association, Captain Lambert proposed and Mr. Benjamin C. Bush seconded—

"That the members of this Association desire to record their deep regret at the loss this and kindred associations have sustained through the lamented death of Mr. Frank Buckland, whose untiring zeal and devoted exertions, both practical and scientific, have tended greatly to improve the fisheries of Great Britain."

The resolution was unanimously carried, and the Honorary Secretary was requested to forward a copy of it to Her Majesty's Inspectors of Fisheries at the Home Office.

The Honorary Secretary reported that the alterations and additions to the fish nurseries had proved very successful, and that the trout eggs in the fish-house were hatching out in a most prosperous manner.

This choice fly-fishing river opens to members on the 18th April, but visitors' tickets are not permitted to be used until the middle of June, after the "rise and fall" of the May fly, which is the "par excellence" of the season. The May fly, as is the case with other streams where it is indigenous, is more or less prolific according to seasons, coming out in large quantities during a mild spring, and of an exceptionally large and yellow colour. There are two distinct species to be met with in the river Stour, viz., those emanating from the cadis enclosed in a short incrustated hollow house, composed of minute shells, stones, &c., being the flattest and handsomest, whilst those produced from the locally-named "stick-bait," consisting of a soft piece of reed or flag, are generally of a sickly grey, and of undeveloped proportions.

There is no better period of the year to determine and judge for yourself as to whether there are trout in the river or not, than to walk along the banks during the time the May fly is out, the fish invariably feeding during the time the fly is on.

Many of the flies are demolished during their transition state, particularly those inhabiting the main stream; but there are a great many brought into existence from the tributary streams and ditches; which love to disport themselves in their full plumage, dancing on the river surface until captured by the swallows, who dart after them with avidity, or are snapped up by the wary trout, which is never in real condition until after the "May-fly is over."

Fishing is only allowed with the artificial fly, a restriction comparatively unnecessary, since the majority of the subscribers, who are real artistic anglers, are content with throwing the artificial and securing a brace or two a day from 1½ lb. to 3 lb. each fish.

The trout will rise in this water either to a wet or dry fly, much depending on the manner in which the bait is offered, and which can only be known to such men as "know every inch of the water." Evening tide has always been the most successful time for getting the big fish where no one even thought of; but letting the fly fall as it might, wet or dry, near the enchanting circle, and allowing it to drift over the extending rings towards the centre of the focus, and challenging the fish in such a way that a rise is only omitted by the clumsy manipulation of the thrower.

The cow dung and red hackle, with peacock body, not too large, are taking flies all the year round, and in the early part of the season the March brown is a sure killer, more particularly in the lower reaches of the Stour, where the water is deeper and with a stiff south or westerly breeze.—A. H. CLARIS.

CAPTURE OF A HUGE PIKE.—A short time back, as Mr. Arthur Nash was fishing on Oulton Broad, he hooked a monster pike, weighing 21½ lb., and measuring 3 feet 4 inches. The fish was exceedingly well formed, and created quite an excitement as it lay exhibited in Mr. B. Mummery's window. It was afterwards sent to Norwich for preservation, and it is believed it will be shown at the forthcoming Fisheries Exhibition.

A FORGETFUL SWAIN.—Some of our readers may possibly have read about the eccentric, but forgetful, Rev. George Harvest, who lived in the latter half of the last century. Mr. Harvest had a partiality for the then Bishop of London's (Dr. Compton) daughter. The wedding day, in short, had been fixed, but, unluckily, he (Mr. H.) forgot all about it, and went out fishing instead. The bishop's daughter, highly incensed, broke off the engagement.—RUS.

THE "CLOSE" TIME FOR THE THAMES.—Cannot something be done to acquaint Mr. Mundella, M.P., of the mistake that has been made in the recent Act in reference to the "close" time for coarse fish in the Thames and other rivers? It is too late now for this season, but communications ought certainly to be addressed to the right hon. gentleman before next spring, upon the subject. Probably an Order in Council could alter the times for "closing" our rivers. It is a sin and a shame to kill roach, &c., in March, heavy in spawn. Jack are not properly in season before Michaelmas. By delaying jack fishing until the autumn, many small things would be spared from being hooked. Perch too are all the better in autumn and winter. The angler who strives to capture a nice Thames trout will, when successful, be amply rewarded for his patience.—SPORTS.

Mrs. F. Y. BROCAS, Artificial Fly Dresser, 4, Mill-street, Conduit-street, Hanover-square, London, W. A stock of best flies always on hand. Flies made to pattern. Lessons in fly making given.—[ADVT.]

FRANK BUCKLAND'S "PORTRAIT AT HOME."

The following article, written by Frank Buckland, appeared on August 2, 1879, in *Land and Water*.

I HAVE frequently been asked by photographers to sit for my portrait. I have hitherto invariably refused, as I have the greatest possible objection to be put up in the shop windows and sold for a shilling. My friend Mr. Sam Walker, of 230, Regent Street, has at last induced me, after much persuasion, to allow him to point his photographic lenses at my phiz. At first I steadfastly refused. He then told me that he had just introduced a new process by which he could save his clients the trouble of calling at his studio, inasmuch as he could bring up all his apparatus and photograph me "at home."

Wishing to see how this novel plan would succeed, and also to encourage a new idea, Mr. Walker came to my house and arranged myself and the groupings in the "monkey room," as the servants call my working place. From the specimens hanging on the wall Mr. Walker selected a cast of a very fine "rod fish"—a salmon, 45 lb weight. By the fish's side he placed an oyster attached to a whelk, from the bottom of the North Sea. Behind the head is the cast of the largest British octopus known, and a very beautiful horn of a narwhal, the owner whereof was harpooned by my friend, Captain David Gray, of the whaler, *Eclipse*, Peterhead, among the ice considerably to the north of Jan Mayan Island, north of Greenland. Behind the monkey's cage is the fore arm of the extinct Irish elk, and in the cage the monkeys Tiny and Jenny. Tiny's outline can just be seen in the corner of the cage, and Jenny's tail can just be made out among the hay at the bottom of the cage. Under the monkey's cage is the tame rat's house, but the monkeys would not keep quiet, or the rat come out. This is not the fault of either Mr. Walker or myself. The background is formed by the shelf containing the bound volumes of *Land and Water*, the weekly "over-matter," &c. I mention all these particulars not out of swagger, but to show what the meaning of a "portrait at home" is. It signifies the portrait of an individual surrounded by his or her favourite belongings,

be they china, furniture, pictures, salmon, oysters, or monkeys. When a person goes to a photographer's studio, it is, of course, impossible to carry about the immediate belongings, surrounded by which we generally associate our friends and neighbours. By ladies especially this new idea of taking portraits "at home" will be appreciated, as a lady, when dressed for presentation to Court, a ball, a wedding, christening, opera, garden party, &c., has simply to stand still and remain quiet while Mr. Walker instantly transfers every detail of feature and dress on to a glass plate.

To the friends of invalids who have not health enough to visit the studio, the knowledge that a portrait can be taken without fatigue, and in the ordinary position, cannot fail to be on many occasions welcome.

In order to test Mr. Walker's skill, I requested a friend of mine, who has a very smart drawing-room, and whose wife is very proud of her "Fixings," to be kind enough to allow Mr. Walker to photograph them in their own room. Although the sun was not polite enough to show his face, yet the general group was admirable, and I recognised my friends "at home" in a moment.

In Sir Joshua Reynolds' time photographers were unknown. Mr. Walker's grandfather, Mr. S. W. Reynolds, engraved most of Sir Joshua's pictures, while his father is also known as the engraver of the "Literary Party at Sir Joshua Reynolds's," "Passing the First Reform Bill," as well as many other works. The grandson, Mr. Sam Walker, keeping pace with modern times, has, while deserting the graving tool and the copper-plate, devoted his whole mind to the perfecting the idea of bringing up photography to a point as nearly equal as possible to engraving. To this he has added the capital idea of not requiring his sitter to come to him, inasmuch as he can bring up his apparatus and finish an artistic portrait of them "at home."

Mr. Farini, wishing to have as good portraits as possible of his "Friendly Zulus," has entrusted the task of photographing them to Mr. Walker. He has brought me proof of these portraits; they are most admirably done and very life-like.

FRANK BUCKLAND.

[Mr. Walker has sent us a copy of this portrait. It ought to be in every angler's album.—ED.]

THE IMPERIAL LONDON BISCUIT COMPANY

(LIMITED).

The Directors have the pleasure to announce that

T. H. FREAN, Esq.,

has joined the Board of the above Company.

Applications for Shares to be made to the Bankers, Messrs. MARTIN & Co., 68, Lombard Street, E.C.;

OR TO THE OFFICES OF THE COMPANY,

9, GRACECHURCH STREET, E.C.

ON THE BORDERS OF ESSEX.

GREAT CONRAD, SUDBURY, SUFFOLK.

MR. G. CARDINALL has received instructions from the Trustees of the late Mr. S. Hartley, to SELL by AUCTION, at the Rose and Crown Hotel, Sudbury, on MONDAY, April 25th, 1881, at Six o'clock in the evening, a superior Freehold Brick-built FAMILY RESIDENCE, known as the "Great House," containing Entrance Hall, Breakfast, Dining, and Drawing-rooms, seven Bedrooms and domestic offices, Stabling, Chaise-house, Groom's Cottage, extensive Pleasure and Kitchen-gardens, with Greenhouse. The property is within a short distance of Sudbury, and covers an area of an acre and a half, within the meet of three packs of foxhounds. There is capital fishing in the preserved river Stour, and good shooting and private coursing to be obtained in the neighbourhood. By rail two hours from London. Further particulars may be obtained of the Auctioneer, Sudbury, Suffolk.

CHERRY TREE COTTAGE, HARBOTTLE, NEAR ROTHBURY.

PRIVATE AND FAMILY BOARDING HOUSE.

EXCELLENT accommodation may be had at the above establishment, situated in the beautiful and romantic village of Harbottle, which is now allowed to be the healthiest district in the kingdom. The beauty of the scenery is not surpassed in the northern counties. Excellent Fishing may be had in the far-famed river "Coquet" and the many adjoining streams. Postal accommodation daily.

N.B.—A conveyance from Harbottle to Rothbury on Mondays and Fridays. Conveyances on hire. Good stabling.

GEORGE R. TURNBULL, Proprietor.

WARNER'S

REGISTERED

SEAT

See "FISHING GAZETTE," August 28th, 1880.

	Med. Size.	Large do.
Without Pockets	3s. 6d.	6s. 6d.
Complete with 2 waterproof pockets	4s. 6d.	7s. 6d.
Complete with 2 solid leather pockets	5s. 6d.	8s. 6d.

Where may also be had "WARNER'S INVINCIBLE BLUE UPRIGHT." See "FISHING GAZETTE," April 2nd, 1881, and other perfectly dressed trout flies. A sample dozen on finest selected drawn gut, 2s. Salmon flies from 4s. per doz.

WARNER'S PATENT NEEDLE-EYED HOOKS, which for neatness, strength, and security are acknowledged by some of the best anglers to be unapproachable. A sample doz. to gut, post-free, 13 stamps.

THE MIDLAND COUNTIES ANGLING REPOSITORY.

A. W. WARNER, Proprietor.

121 and 122, BROAD STREET, BIRMINGHAM.

TROUT AND GRAYLING FLIES.

J. A. GRIFFIN, Practical Fly-maker, begs to inform Anglers that he has in stock some of the best FLIES, both for natural colours and fineness, combined with strength, at 2s. per dozen. Best Gut Casts, all warranted to lift 4lb., 9d. each. J. A. G. calls attention to his £1 1s. 6-joint Pocket Fly Rod. Flies and all other Tackle made to order, and Forwarded to any part of the kingdom, Post Free, WITH ALL HASTE.

S. BIGG,

FISHING ROD AND TACKLE MANUFACTURER, 33, RUSSELL STREET, COVENT GARDEN (Private door).

Buy of the Maker, and save 25 per cent. All Rods and Tackle warranted the best Quality and Make.

Superior Fly Rods, Spinning Rods, Flies, Winches, Paniers, and Tapered Gut Casting Lines. The American Braided Silk Waterproof level and tapered lines and double tapered Fly Lines, the strongest and best lines ever invented.

WANDLE TROUT FOR SALE.—Some Thousands of the Young Fry of these Celebrated Fish. Will be ready for removal about the end of April, at £4 per thousand. Apply to H.N.G., Hon. Sec., The Cottage, Mitcham, Surrey.

TROUT FRY.

THE SALTAIRE ANGLING ASSOCIATION have a few thousand healthy Lake and River TROUT to dispose of. 50s. per 1000. Apply G. BOLTON, Sec.

GOOD FISHING WANTED TO RENT, within Moderate Distance of London, easily accessible and adapted to the general requirements of an Angling Society. Send particulars to THE GRESHAM ANGLING SOCIETY, 19, Throgmorton Street Bank, E.C.

NOTICE.

Communications relating to the Literary Department, Fishing Tackle for Notice, Books for Review, &c., must be addressed to the Editor of THE FISHING GAZETTE, No. 12, Fetter Lane, London, E.C. and should reach the office not later than Tuesday morning.

Contributions are solicited, but the Editor will not undertake to return rejected MSS., unless accompanied with a stamped addressed envelope.

Correspondents are requested to write on one side of the paper only and give their real names and addresses, not necessarily as signatures to their letters, but as a guarantee of good faith. Unless this rule be adhered to no notice will be taken of such communications.

THE FISHING GAZETTE is published every Saturday, and can be obtained at Messrs. W. H. Smith and Son's Railway Bookstalls, and of the following, amongst other Fishing Tackle Dealers in London and the Provinces:—

Messrs. Alfred and Son, Moorgate-street.
Messrs. Price and Co., 8, Seymour-street, Euston-square, N.W.
Messrs. Williams and Co., Great Queen-street.

THE NATIONAL FISHERIES EXHIBITION.

THE opening of the National Fisheries Exhibition at Norwich, on Easter Monday, was in every way a brilliant success. The Prince and Princess of Wales, Prince Leopold, and the Royal party, were favoured with lovely weather, the sun shining through

the clouded sky and tempering the cold north-easter. The old city fairly arrayed itself for the occasion, and wore a profuse drapery of flags and flowers, the quaint and winding line of streets—in which the new is everywhere striving for mastery with the old—presented a wonderfully picturesque appearance. The ceremony has been very fully described in the columns of various contemporaries. It will be sufficient to note that the original programme was fulfilled to the letter, and that in the day's proceedings pleasure and work were agreeably mingled. The Prince showed himself gracious and attentive as is his wont, the Princess was charming as ever, and the citizens exhibited every sign of loyalty and respect. The visit to the exhibition occupied some considerable time, and was anything but perfunctory in character. The interest of the Royal party never flagged, and no noticeable feature was passed over. The sections devoted to our marine fisheries, and the objects associated with the fisherman's calling and social condition, came in for special observation. Anglers will be pleased to observe that their interests were not forgotten: Mr. Jardine's grand collection of preserved fish was favoured with a minute inspection, and the exhibitor was able to unfold their merits and beauties to the Royal visitors. It need only be added that the decorations of the hall were handsome and appropriate, and that the public interest has so far been admirably sustained. The great importance of the exhibition, its marvellous variety and its extent, and the illustrations it supplies of a delightful and popular sport, are the best guarantees of its success. It is only reasonable to anticipate that the results will be such as to ensure to the Committee, and especially to the energetic president (E. Birkbeck, Esq., M.P.), a full reward for their labours.

A glance round the Drill Hall and its spacious *annexe* shows how wide is the ground covered by the exhibition. The exhibits are divided into six classes, and nearly every one of these opens up a fresh line of study and source of attraction. There are to be seen representations of well-nigh every kind of fishing vessel in existence—from a Yarmouth trawler to an Indian canoe—and illustrations of every branch of industry that may be said to have the remotest connection with the "fishing interest." From the fish to the fisherman, from the live to the dead specimens, from fishing tackle to fish culture—whether the end in view be useful or recreative, to preserve or to destroy—the method of illustration is as full and complete as can well be desired. For the convenience of the readers of the FISHING GAZETTE, it may be well to disregard the classification in the catalogue. We propose, therefore, to treat exhibits which relate to the "rod and the angle" in the present article, and to reserve the great subjects of pisciculture and marine fisheries for a future paper.

The sides of the hall itself are occupied by a number of cases of preserved fish and fish-eating birds, forming a very fine and complete collection of the aquatic *fauna*. The exhibits are arranged in separate bays, lined with red cloth and surmounted with trophies of heraldic devices. The gems of the collection are, beyond question, the group of shore and fish-eating birds lent by H. Stephenson, Esq., the splendid contribution of the Piscatorial Society, and Mr. A. G. Jardine's magnificent exhibits. Many of the specimens have interesting little bits of history attached to them. A goodly number are in the nature of "trophies," testifying to the prowess of some local angler, who has been careful to record the particulars of his triumph. Thus Mr. Fred. Thorns, of Norwich, shows a pike weighing 36 lb., caught by him in February last—a tremendous fellow, but neither particularly elegant nor very neatly preserved. The Hon. J. de Grey, Mr. R. Rising, of Horsey, Mr. R. Blake-Humphrey, and others, have some fine specimens, and altogether the collection of pike is a feature of the exhibition. Let us turn to the cases in the order in which they are ranged, beginning at the

right-hand side of the dais erected for the reception of the Royal party. Mr. D. Houghton, of Norwich, sends a nice collection of local fish, and W. A. T. Amherst, Esq., M.P., exhibits a sturgeon, preserved, by the bye, in a fashion that is more ingenious than natural; and Mr. W. Howlett, of Newmarket, has a number of pike, bream, roach, perch, chub, &c., caught in the river Lark. In the next few bays angling associations are well represented, the Portsmouth Waltonian Angling Society contributing a nice museum of freshwater fish, neatly mounted and preserved. The Silver Trout Angling Club occupies two bays with a fine collection, the specimens of tench being especially remarkable for size and weight. One of the "curios" is a case containing a 4 lb. pike in the act of swallowing another pike weighing about 2 lb. The proverbial voracity of the species could not be more neatly illustrated. Mr. Mason, of the Wherry Hotel, Mutford, shows a variety of coarse fish and aquatic birds shot on the Oulton waters, one of the most charming of the Norfolk Broads and a favourite angling resort. Colonel Leathes exhibits a grand otter, and other objects not especially interesting to the freshwater fisherman. Two curiosities in this part of the exhibition are the skull of an angler fish, and the sun-dried head of a pike measuring no less than four inches between the eyes. The Waverley and Oulton Fisheries Protection Society have, in addition to an excellent assortment of fish, some fine water-colour drawings of Suffolk fishing stations, by Harrison, of Yarmouth. H. M. Upcher, Esq., shows a good collection of birds, somewhat indifferently preserved. We come now to Mr. Stevenson's unequalled collection of Norfolk aquatic birds, which include tits, terns, sandpipers, bitterns, and other species, many of which are great rarities, while others are practically extinct. All of these, be it observed, have been shot in local waters, the great confluence at Breydon, off Yarmouth, supplying a large proportion of the specimens. Among the rarest are a pectoral sandpiper, green-backed gallinule—the only authenticated wild specimen ever secured—different varieties of the crake, and other treasures of the naturalist and collector. The collection also includes a case representing a charming little picture from nature—a tern, hovering and lamenting over the dead body of one of its mates. Mr. Cole, a local stuffer of considerable skill, fills the next two bays with some fine cases of fish-eating birds, admirably mounted and preserved. The specialty is a large case representing a pair of herons in water, a picture of Surlingham Broad being painted in the background. Mr. Perelli-Rocco exhibits some casts of fish done in *papier maché*—a novel and interesting process—and Mr. W. Loughrin, of Cornwall, some cases of stuffed marine fish, including sturgeon, &c. The Piscatorial Society are worthily represented by forty splendid cases of preserved fish caught by members of the society. The whole collection is beautifully mounted, and many of the specimens are remarkable for size, weight, and beauty. They include Thames and Wandle trout—a great feature—pike, chub, a specimen of the flying-fish caught in Brazilian waters, &c. There is also a cast of a pike finely modelled by the late Frank Buckland, Esq., and painted by Mr. H. S. Rolfe. The loving cup of the society—quaintly formed out of a pike's head—and a carved oak chair with appropriate devices—make up a truly magnificent collection. Mr. Jardine is next to the front with a splendid set of cases, comprising no less than ten pike of extraordinary size and weight, and most of them caught by the exhibitor. A couple of monsters in one case weigh together 73 lb. The veteran fisherman also shows some of Mr. Buckland's exquisite modellings of pike, a lake trout weighing 26 lb., and a number of splendid Thames trout, barbel, tench, carp, perch, chub, &c. The cases on the left-hand side of the dais may be briefly summed up. Mr. Gunner, a local naturalist, has a great collection of fish and aquatic birds, the largest and finest case

representing an otter with young. There is also a curiosity in the shape of a heron being throttled by an eel. Messrs. Tomkins, of Yarmouth, show some casts of sea-fish captured off the coast, and also a cast of a silver eel by the late Mr. Frank Buckland, and painted by Mr. Rolfe. Mr. C. J. Greene, a keen local angler, and secretary to the Yare Preservation Society, exhibits a splendid specimen of bream, weighing 9 lb. caught in the Wensum, and believed to be one of the fish originally turned into the river by the late Nicholas Bacon, Esq. The others have nearly all been captured, and many of them have been preserved by the successful anglers. S. G. Buxton, Esq., of Calton Hall, and J. D. Berney, Esq. (the High Sheriff of Norfolk), and Mr. J. De Grey, and other gentlemen, send some remarkable specimens, including a salmon caught at Fakenham, near Norwich; and there is also a stuffed carp, captured at Cantley by Mr. Brett of Norwich. It is supposed that this "Mr. Carp" has other brethren in the same waters, and that many an "ugly rush," carrying away the hooks and tackle of the astonished angler, is to be attributed, not to huge bream or mighty perch, but to the big carp which lurk in the unknown depths. We give the tradition for what it is worth, and pass on to the "feast of tackle" which is temptingly disposed on one of the lines of central stands in the hall.

It is truly a wonderful assortment. Rods, lines, hooks, reels, artificial baits, flies, gaffs, fishing baskets, bait cans—every conceivable appliance to meet the angler's necessity, or to gratify his taste for luxuries—are set forth in bewildering variety and profusion. The exquisite finish of the rods, and the fineness and delicacy of the tackle are greatly to be admired. The Editor of this journal has a neat "basket," made up of the various specialties to which he has given the name of the "FISHING GAZETTE."

Among these is the celebrated spinner, leads, knife, pliers, pannier straps for fishing basket, and other novelties. The chief London and Nottingham makers are exceptionally well represented. Messrs. Alfred and Sons, of London, show complete anglers' outfits for all kinds of sport, "*Bell's Life*" spinners, improved winches, extra-strong salmon gut, and two splendid frames, one containing every description of artificial flies—from the gorgeous salmon-fly to the modest black hackle—and the other a complete assortment of artificial baits, specimens, &c. Messrs. Alfred also exhibit a "thermal" roach rod, for testing the temperature of the river when the fish are off the feed. Mr. Greene, of Norwich, referred to above, has an assortment of tackle, &c., of great variety, which commands deserved attention.

We have left ourselves small space to notice the aquaria which occupy a corner in the *annexe*, and which contain most of the local varieties of fish and some rarities. Lord Walsingham, Lord Henniker, and the Norfolk and Suffolk Fish Acclimatisation Society, are the principal exhibitors in this section. The specimens shown include several sorts of sticklebacks (including the rare four-spined variety), trout, English and American brook trout, golden tench and perch, turbot, and nearly all the commoner sorts. The little prisoners all look thoroughly healthy, and the whole collection makes one of the prettiest features in the exhibition. We may note that the gallery above the dais contains an admirable series of fish pictures, with contributions by Mr. Rolfe—exquisite both for form and colour—and by painters of the Dutch school. The history of fishing is also illustrated by a few works on angling, &c. We have said enough, we believe, to commend this unique exhibition to the attention and support of the country, and in a subsequent notice we shall deal with other objects of interest now unmentioned, and with the various models and essays entered for competition in an admirably-filled prize-list. We may, however, further state that the Yare Preservation Society held a gloriously successful dinner on Tuesday evening in

St. Andrew's Hall, the scene of a most hospitable reception on the previous day, when the worthy mayor (S. Grimmer, Esq.), entertained the royal party and a select number of the *élite* of the city and county.

A DAY ON THE DERBYSHIRE WYE.

A FINE morning in the autumn of last year found me on the banks of the Wye at Rowsley, just above its junction with its sister stream the Derwent, armed with fly-fishing paraphernalia, and fully prepared to do great execution amongst its finny inhabitants. I could write pages about the beauties and charms of this, my favourite and native stream, in whose clear and limpid waters I love to cast my fly; but in this brief note I have not space, and if I had, perhaps I might tire my readers' patience with the eulogies and praises I could bestow on this beautiful river. To return, however, to my original subject. I soon put my rod together, which consisted of three joints, the whole length being nine feet, and after adjusting my cast to the line, I commenced operations. The water was in pretty good condition, but the sun shone brightly, nor was there much prospect of the sky clouding over, and thus favouring my pursuit. Not a single rise did I see until the afternoon, during which time I flogged the water perseveringly; but then a slight wind arose, some welcome clouds hid the sun from view, and the trout at last began to feed, though sparingly, of the numberless flies floating on the surface of the stream. I soon basketed my first fish, a handsome trout of $\frac{1}{2}$ -lb. I saw him rising in some still water, close to the bank, and threw over him a good many times before he allowed himself to be hooked and landed. Soon after this I hooked and landed three more trout of about $\frac{1}{2}$ -lb. each, in the rapids, one of which fought hard for his life and liberty before I lifted him out of his native element and transferred him to my creel. By this time it was about four o'clock, and I had only two hours' more fishing before me, having to return home at six. The next two fish I captured were grayling, which I returned to the stream, although I might have lawfully retained them. However, I always think it a pity to catch grayling in the summer, and I sincerely wish the Duke of Rutland would see the necessity of setting apart say three months of the year as a close time for this scarce and pretty fish. As it is, the poor grayling are allowed to be taken all the year round on this river; though, I am glad to say, the month of April is set apart as a close time on the Derwent. This, though not much, is better than nothing, and I hope that this fish will, in future, have a close time as well as the trout. They are getting scarcer and fewer in number every year on the Wye, which is probably owing to this reason, though there certainly was a disease among them a little time ago, which committed sad havoc in their ranks.

The next fish I caught was a splendid trout, and I was very proud of its capture. I saw it rising, and threw over it about twenty times, but with no result. I was giving it up in disgust, when, just as I raised my line to move further on, I felt a tug—tug! at my line, and struck instantly. I thought at first I was fast in some obstruction in the stream, but my delusions were quickly dispelled, and I soon found out that a noble trout was fighting hard for his freedom. As I mentioned before, I use a small light rod and the finest tackle, which one must use to catch trout in Derbyshire streams, so I had hard work to prevent my quarry from breaking away altogether, and he certainly tried his hardest to do this. Now up, now down stream he dragged me, nor could I stop his first mad rushes. Then, like a log of wood he sulked at the bottom of the river, and remained motionless. His next move filled me with horror, and it was to dart straight down stream under some large branches of a tree hanging down within a few feet of the water, under which I should have to pass if I let my wilful fish have his

way, and, indeed, I had to acquiesce in his wishes if I did not want to lose him. During the next few minutes, my breast was the scene of a struggle between hope and fear, as I carefully crept under the overhanging boughs, and guided my rod past them as best I could. I reached the other side in triumph, and after a few more minutes' play I landed my fish—a splendid trout of 1 lb.—after which I sat down beside it and gloated over my handsome capture for at least five minutes. Ifancy I hear some swell south-country anglers, who are wont to catch the giant trout of Hampshire streams, pooh-poohing this simple tale of the capture of a mere pound fish as not worth the trouble of talking about, and much less of writing about. But let such as they know that Derbyshire anglers are well contented with their basket if it contain a trout of a pound weight; the fish usually running from $\frac{1}{4}$ lb. to $\frac{3}{4}$ lb. Minnow-fishers and bottom-fishers sometimes boast of capturing trout of $1\frac{1}{2}$ lb. and 2 lb., but those who prefer the more scientific and gentlemanly way of filling their baskets by throwing the fly (and, indeed, there is no other way permissible on the Wye), are seldom able to boast of taking larger fish than those of 1 lb.

After this little episode I lost a couple of fish through their not taking my fly eagerly enough to have it firmly fixed in their jaws, and caught a few undersized ones, which I carefully returned to their native element, sadder, if not wiser youngsters, to increase in size, and in after years, to afford better sport to some fortunate angler. Just before leaving off I caught three more decent trout, one nearly reaching $\frac{3}{4}$ lb., making a total of four brace of handsome fish, which is considered a pretty good day's sport on the Wye.

The flies I used were the blue and yellow duns, and I consider them better than any others for all times and weathers, and in any stream. Of course they must be dressed small, as the trout here are highly educated, and, moreover, very shy. Add to these the down-hooker, or, as it is sometimes called, the oak fly, and the black gnat; if he use these only, the angler will do well, and save much time and trouble.

BLUE DUN.

THE FISH OF THE TRENT, AND HOW TO CATCH THEM.

PLAIN PAPERS FOR PLAIN ANGLERS.*—No. 10.

BY THE TRENT OTTER.

THE CHUB, *continued*.

VARIOUS methods are employed for the capture of the chub; and, in the first place, I will commence with float-fishing. The rod and reel described in barbel-fishing will be just the things for chub, as also will the line; and your bottom tackle should be as fine as you like, the finer the better consistent with strength, for remember you have to deal with a very shy and cautious fish. Your tackle for bottom-fishing for chub should be about five feet long, but, of course, it will be as well to have one or two that are not so long—say about three or four feet—in case you should want to fish in water that is not so deep. Pale-blue gut, or stained of a brown colour, is, in my eye, the very best to make your tackle of, and for a float, if you can help it, never have one any larger than a goose quill, that will carry eight or ten split shots. For summer-fishing, when the water is low and bright, don't have one of your split shots less than eighteen inches from your hook. For successful chub-fishing your tackle, &c., should be as neat as possible, for it is a downright insult to the intelligence of a chub to drop a lot of big split shots and heavy leads, on coarse tackle, over his nose. Hooks may be of the following sizes: Nos. 6, 7, or 8, according to the bait you use. Chub may be ground-baited

* All rights reserved.

for beforehand, the same as I have mentioned for barbel if you like, but I don't think it pays very well, for, as a general rule, the most chub may be caught by rowing about for them—half-an-hour in a place is quite sufficient in my idea—and keep throwing a little ground-bait in as you go along, or just before you fish another place. If the water runs tolerably fast, throw your ground-bait in a dozen yards above where you are going to stand, or the stream will carry it clean out of your reach; but if the stream only glides along more slowly; you need only throw the ground bait in a yard or two above you. If you are fishing with worms, a nice lively well scoured maiden lob worm is as good as any, on a No. 6 or 7 hook; and for this bait fish as near the bottom as you can. If you notice an eddy under old roots or an overhanging bank, with a sharpish stream outside; and there should happen to be six feet of water, don't pass a place like that, but take about half-a-dozen coarse worms, and clip them up in little pieces and throw them in; and then take a nice red maiden lob, and thread it carefully on your hook, and throw in; and ten to one in about ten minutes you will have caught a brace of nice fish. I should then leave that place, but before going I should cut up and throw another half-dozen worms in; and then look for another shop and treat it just the same. Of course gentles, or scratchings can be used in the same way as worms, only when you are using gentles on the hook; throw a few gentles in, and when you are using scratchings on the hook throw scratchings in for ground bait; a few pieces at once in my idea is quite sufficient. I know of no other sort of fishing that I like so well as chub-fishing; wandering along the bank for a mile or two; drawing a brace of chub out of this hole, and another brace out of that hole. A bit of a bush, or the roots I might say, will sometimes hold a good fish or two, and ought never to be passed by. Sometimes you may drop your bait in a very unpretending looking spot, and your float has hardly time to steady before it goes down with a rush; and after a few minutes a three pounder, perhaps, lies gasping on the grass. I think August and September are the best months to use worms for chub, and September or October for scratchings; and gentles anytime, about then, for a change. Put about half-a-dozen gentles on your hook as carefully as you can, and let your bait be very near the bottom.

An old friend of mine was once fishing with some very primitive tackle. The rod was a long stick—an osier, if I recollect aright—and he had only a yard or two of line tied on the top, and a short gut tackle on the end of the line. He was fishing for roach with gentles; and the bank was very high and steep—about eight feet from the top to the water. He had been fishing some time without any success, when all at once his float went down with a bang. He at once struck, and, by the way the fish pulled, he found that it was something unusual, and as he had no reel or running tackle, he was in a bit of a fix. “Happy thought!” he at once threw the rod in the water, and let the fish tow it about for a time. This was rather a risky proceeding, but the weather being warm, he pulled off his clothes, and waded for him; and at last, after a bit of trouble, succeeded in tossing him high and dry on the bank. I myself, when roach fishing (but I must say that the chub just mentioned weighed over four pounds), have very often caught chub with gentles, but mostly at the extreme end of the swim; and if you think there is a chub about, a swim of a few yards further will very often fetch him.

Brandlings, cockspurs, and blood-worms may all be used with effect in chub-fishing, and to enable the tyro to recognise these worms, I might say that the brandling is a very nice-looking worm, marked from head to tail with alternate bars of red and yellow; they are found in old tan heaps, old manure heaps, or any old heap of decaying vegetable matter; and in the same heaps you will find

a worm of a nice pink, or rather red colour, rather short and thick; with a light-coloured knob round the middle; these are cockspurs, and the bloodworms are found in the excrement of horned cattle. They are a small worm of a deep red colour. Two, three, or four of these sort of worms, according to the size of them on your hook is a capital bait for chub, especially in the spring of the year.

(To be continued.)

HOW TO CATCH EELS.

SNIGGLING.

THIS is a mode of capturing eels which at the first blush appears wholly unworthy to be termed sport; nevertheless, those who have once practised it are ever ready to continue it, and we have known those who have, after looking upon the pursuit with contempt, become its most inveterate followers.

We cannot better describe the *modus operandi* than by copying a manuscript letter written some years ago by our friend the late Mr. Edward Jesse, then Her Majesty's keeper of the Royal parks, and an ardent angler.

In a quiet mill head or clear pond, or in any other place where there are eels, and where the ground is soft and easily seen, there are commonly to be observed upon the surface of the mud a number of round and cup-shaped holes. Now the fresh-water mussels (*Mya ovalis*), are wont to bury themselves in the mud, and will lie at the bottom of the same kind of holes, which they make by opening and then forcibly closing their large shells, and so repeatedly throwing out the water with the mud that it contains to a certain distance, until at length the latter subsides round the place and leaves a cavity in the surface. Whether this be exactly so or no, it is well known to naturalists that the same effect is produced by the bull head, who operates in a similar manner with his mouth. The holes alluded to are not made by the *Mya*, but by eels, who, after burying themselves, make them, no doubt by the same mode of proceeding as that of the bull-head.

Most certain it is, that when we see such a cavity, of about two inches or more in diameter, which appears to be fresh and evenly formed, if we are able to get close enough to it, we shall also be likely to see the lips of a large eel just barely protruding from the bottom of it, and slowly performing the process of respiration, whilst the rest of the head is invisible.

Moreover, if we carefully let down a lob-worm, and hold it so that it may gently touch its nose, the consequences will, as probably, be such that the fisher will not soon forget them; for the eel will, most likely, seize the worm, and if he does so, he will seize it like a tiger, or with such a desperate or sudden snap, and plunge away with it at the same moment so far into the mud, that if the fisher's nerves are tenderly strung, it may go hard with him for awhile; the effect in such a case being often little less than that which is produced by the bang of a pistol, when it is fired close behind a man who is alone and unconscious that such a thing is going to be done.

Consequently, when such holes abound, there arises the following method of fishing for eels, which is both scientific and exciting:—

A strong line is tied to the middle of a short and thick needle—in other words, the angler makes a “sniggling needle,” but shorter and stronger than such a needle is commonly made, because it is commonly made too long, and with much too thin a needle—and having killed a lobworm, by throwing it with sufficient force upon hard ground, and dividing it and taking the head part, into the other end of that part of it he inserts a needle, as in a case of sniggling, or so that the head of the worm may be presented to the eel. Such a bait—or suppose a minnow, though we

never tried one—the head of the needle being pointed towards the minnow's head, is let down to the holes from the end of a stiff rod, which has tied at the top a piece of cork to slightly insert the point of the needle in so that it may be easily detached.

When the worm is seized, line enough is given to let the eel run and gorge the lure. After a few minutes have expired the line is tightened, the action of which is to draw the needle across the gullet of the eel, and then it is "pull devil, pull baker," the power of the eel being exerted, to an extent, beyond belief, particularly if it has taken a course in its run which affords any roots by way of fulcrum, with the assistance of which it can the better exercise its strength. We have used the word pull on the part of the fisher, but by this must be understood a continuous strain; all the pulling for a time being done by the eel, which, when exhausted, will surrender and permit itself to be drawn out with but very little resistance.

Blain, in the last and more copious edition of the "Encyclopædia of Rural Sports," speaking of sniggling for eels, tells us it is a practice so ingenious and full of artifice, that it might reconcile the sportsman even to eel-fishing. Every boy, almost, who lives within sight of an eel river, can sniggle, which ill accords with this account of it; but let any one accompany the true eel sniggler in search of his material to the fishing-tackle shops, where the fisher is fitted to his mind with a well-contrived set of machinery, expressly adapted for this hole and corner work; let him finish by witnessing the application of it to the taking of a few eels, by a writ served on them within the recesses of their dwelling, and we will then agree that this, like every other pursuit, however trifling, can be made interesting when improved by art.

Mr. Salter, with the professional ardour of a true London angler, has entered into an elaborate description of the most improved apparatus for the purpose, which he has done with a minuteness of detail that not only evinces his own proficiency as a sniggler, but shows how much he was interested in making others equally so; and we should be robbing this excellent practical writer of his just due if we did not own that any success which has awaited upon our own eeling adventures is traceable to this source.

The more common country practice of sniggling is thus characterised: a stick a yard long with a cleft at each end, a strong needle whipped to a small whip-cord line from the eye to the middle, which, with a lob-worm stuck on the needle leaving the point to be inserted in the cleft of the stick, constitutes the simple apparatus. The art consists in putting the worm, needle and line, softly into the mouth of eel holes, which are suffered to remain until taken by the eel, when the line and hook are again reclaimed, but accompanied by the eel also. This outline forms the boyish practice we have hinted at, and we now proceed to the more improved methods pursued by the regular eel-fisher.

The sniggling-rod, instead of being one yard long, ought to be two or two and a half in length. Two joints of the hazel rod, commonly made up for the purchase of youths, form one of the best roots, being light and tough, but Salter's recommendation is two yards of stiff bamboo. To such a root, or rod, a top must be fixed; and it is essential that it must be flexible, and that it remains flexed or bent at any angle or segment desired. In the common method this is imperfectly fulfilled by means of a branch of willow or hazel, which, being first bent to the required position, is then tied by means of a cord extending from the point to the middle of the rod. An improvement is now made in this by substituting for this top half a yard of stout bell wire, which requires no tying, and can be bent and unbent at pleasure. The crack fisher, however, is often furnished with a top expressly manufactured for

this purpose by the best rod-makers from three pieces of hickory, each of five inches length, the sides of which are united to each other by two hinges, similar to those used in the making of carpenters' rules, by which they can be bent to any angle required. It must be notorious to those acquainted with London anglers that great pains are taken by them, and other piscatory amateurs of metropolitan towns, to make their tackle portable as well as effective; and if it can be hidden, that too is a greater recommendation. The sniggling apparatus, be it observed, may be readily formed on these principles. The rod may be made of two telescope joints, one of which may slide into the other, leaving room to receive the wire also, if the top be of that material. If it be the folding brass-jointed article just described, that will enter the pocket, or even the pocket-book, and the whole may then appear as a walking-stick only, and go into the bag with the other joints of an ordinary rod.

A few eels in addition to the contents of your bag are also acceptable, and often more welcomed upon reaching home than most fresh-water fish. Thus the occasional employment of the sniggle, say when other fish are not on the feed, or as an agreeable variety to a day's fishing is here ready at hand. The line, for convenience, may be held in folds in the hand or wound round a common thumb winder.

It must be obvious that the strength of the rod does not enter into our consideration, as its only duty is to guide the bait into the hole, and that when this is snatched off by the ravenous eel it is no longer required, but placed aside for the next essay. Still, there are those who would assimilate the pursuit more to the higher branches of angling, and for this purpose so contrive that, by the line passing through a ring at the top of the rod, the eel after capture may be the better played in its natural element, and lifted out rather than dragging it ingloriously ashore through weeds and other impediments which may more or less jeopardise its certain capture.

Sniggling appears to us to suggest the question, as the eel lies in its hole with its mouth uppermost, how it enters its retreat. We know that the power of an eel's tail is very great, and that being prehensile, it uses it to escape out of the closest bags made of fabric, as well as to reach the tops and sides of tubs and buckets to pull themselves over. But we have never heard it suggested that an eel enters its hole tail foremost. The only way we can account for their position is, that they lie *perdu* in either a perpendicular position beneath the surface of the soil or enter at some other opening. But if this were the case their retirement and re-appearance elsewhere would, we imagine, have been noticed; and moreover, the purchase thus gained upon the line of the fisher would be so considerably augmented as to test the best line, or drag out at times the contents of the stomach of the eel.

The way to kill the eel and to take out the needle (although the fisher should be supplied with a few, to save time in this operation) is to throw over it enough dry earth or sand to cover it—but earth we think is better, because it will more immediately absorb the moisture of the skin—which being done, it will be still, and therefore enable you to give it a crack with the butt end of your rod on its tail which at once paralyses it. It is then to have the *coup de grace* by dividing the spine at the juncture with the head, which puts all doubt at rest. The needle being forced to show itself under the fish's throat, may afterwards be drawn out by the head, together with the line to which it is tied through a small slit made in it at that part with a sharp pen-knife.

CREELE.

Mrs. F. Y. BROCKAS, Artificial Fly Dresser, 4, Mill-street, Conduit-street, Hanover-square, London, W. A stock of best flies always on hand. Flies made to pattern. Lessons in fly making given.—[ADVT.]

RIVER REPORTS

MID-THAMES.

"Will fortune never come with both hands full."

—SHAKESPEARE.

Fortune does not shine on piscators just now, nor even come with one handful of comfort to the almost despairing Thames tourists. A ray or two of sunshine did fall upon the river last week, but the cruel east and north-east wind is again upon the face of the waters, and kicksome, light-finned trout no longer flash their beauty before envious eyes, but have sunk away in dudgeon into the deepest recesses of their winter quarters. At Maidenhead some few foolish little fish have been tempted to wing their flight from their mother element, but the captors, I believe, in every case have returned them to their parent. At Marlow, Mr. Huggett, Mr. Bedford and Mr. Ritchie have been tempting beauty with glittering baits, the former gentleman being the most favoured, with four fish, but the largest was under 4 lb. At Hargrave I hear that Wm. Wyatt has spotted several thumping beauties on the feed not many miles from his comfortable hotel. Piscators should make a memorandum of this, and remember if the trout do not feed, humanity does, and to perfection at Wyatt's well-known hostelry.

THURSDAY EVENING.—The river is progressing about as usual, but the distressing attacks of wind remain unaltered. If these symptoms continue the prospects are decidedly fishy, but the advent of a little sun would change affairs immensely, and for no one more so than—MARLOW BUZZ.

Barle and Exe (Dulverton).

Anglers who have come for the Easter holidays to spend a few days in fishing these streams must have experienced some disappointment, as since the beautiful change we had the beginning of last week, when everything looked favourable for fishing, the wind veered once more round to that anything but friendly quarter to the angler, N.E.—very cold, accompanied with sharp frosts. These rivers have run down, and are now very low, so that until rain comes and thy wind changes the prospects for the next few days are not rosy. A great many anglers have been out during the week, but I think if all the trout that were caught were put together they would not muster many more than the number of fishermen. I do hope we may get a change within the next day or so. The barometer here is falling this afternoon.—W.

Dove (Derbyshire).

At Uttoxeter, Rocester, Hartington, Ilam, and in Dovedale, the Dove's banks have this week been daily lined with roadsters in pursuit of master speckle. The weather, however, has been about the severest I ever remember for mid-April. There have been abominable east winds blowing ever since Good Friday, and they have driven every fly off the water. However, some fair dishes of trout have been secured, the best one of six and a half brace, which were killed in Dovedale. The yellow dun of April and the March brown have been killing as well as anything. A roadster in Bently Brook caught three fish with the artificial minnow, weighing over 4 lb. Your readers will no doubt have heard of the death of Mr. David Foster, the well-known naturalist angler of Ashbourn. I sent you word last week, but my report may not have arrived in time. The deceased was highly respected by all who knew him. His remains have been interred in Ashbourn churchyard. The business he had for nearly fifty years carried on as a manufacturer of fishing materials will be carried on as usual by his eldest son, Mr. David Foster, junr.—THE SPODGER.

Exe (Exeter).

We are in the enjoyment of splendid angling weather. The river is all that can be wished. The cuckoo has been heard and "Mackerel" have at last been cried through the city, although it is some four weeks later than last year when they were first cried. They have been anxiously waited for by the fishermen, who have suffered much during the past inclement weather, owing to the lateness of their arrival; and had it not been for the long continuance of the herring with us, the distress would have been very considerable. Salmon fishing is not quite so good this week, but trout and peal are showing up in goodly quantities. Roach and dace are looking well and bright, but the gravelling are more numerous than ever; hundreds are taken daily, and supposed to be returned. Eels are more plentiful, but small lobsters and crabs, from the "Exeters" (rocks near Budleigh Satterton), are coming very fine, but prawns are still scarce. A fine otter of 16 lb. weight was taken at Salmon Pool last week, which is to be preserved and placed alongside the sturgeon taken some few years since near the same spot, at host Husson's, Salmon Pool Gardens, where Messrs. Martyn, Pearson, G. Lee and others have done so well this season. Mr. G. Lee took the first peal of the season last week, weighing 3½ lb. weight.—FRANK GOSDEN.

Exe (Tiverton).

Fly-fishing—trout. The river is very low and clear, and little is being done. Good Friday and Easter Monday are looked upon here as fishing days, when almost everyone who can fish takes the advantage of the holidays. Very few fish were killed, the largest basket I heard of was twenty-five, taken principally with small half-stone, blue upright, and allerbud. There is no chance of good sport until we have had rain and the wind shifted from north to south or west. Snow fell here this morning.—WILLIAM MUDFORD.

Ilfracombe.

There is very little doing at present either in fresh water or sea fishing; in fact there have been no catches worth reporting since Christmas, owing to so

much north-east wind, which makes this place a lee shore. All hands are busy here getting their tackle ready for bass, pout and bream fishing. We generally get fair catches of these fish commencing in the month of May; heavy catches commence in June, and last up to October. We know the fish are here, for when one can get a chance to put out, if only for an hour, we all get a few pounds of fish. All that is wanted is a south wind and fine weather, when I hope to be able to make a better report.—HENRY COMER.

Lee (Co. Cork).

With the exception of a few days, during which easterly winds prevailed, there was good sport daily during the fortnight. Mr. Barter, on Tuesday, took seven with the shrimp, and a gentleman who accompanied him got three. Among the other successful anglers were, Captain Abbot, four; H. Dale, six; Sir Augustus Warren, five; Geo. Haynes, three; D. Riordan, two; Mr. Angler, two; Dr. Taylor, one; Capt. Ducrot, one; Mr. T. Lyons, one; W. Haynes, two. Several nets belonging to poachers were seized during the past fortnight.

Severn and Teme (Worcestershire).

These streams are low and fine, all that is wanting to give the fly-fisher a chance of taking a basket of trout is twenty-four hours warm weather and a few April showers. The few days' fine weather we got last week gave many the opportunity of trying their skill, and but few landed the spotted beauty, for the streams are as fine as can be, and the novice cannot get near the fish. Those who go angling now must be careful to keep out of sight, and throw their bait up stream, in fact keep behind the fish. Mr. Fowler landed 3½ brace weighing 6½ lb. with the early dun and spinner, Mr. Guillam caught and weighed in 3½ pound, one fish a pounder, myself bagging 2½ brace with the minnow. I saw eleven trout more, but three brace run short and got back to their holt.—J. A. GRIFFIN.

Suir and its Tributaries. Clonmel, (Ireland).

The fishing here was splendid all last week until Saturday when the wind again changed to the east, and since then very few salmon were taken. Mr. Stewart (20th Hussars), killed two at Molough, Paddy Huffe, one of 25 lb. at Newcastle, and Tom Russel one at Dudley's weighing 11 lb.; we have not heard that the Cahir Club had any sport. The cotmen only got 12 salmon at Clonmel last week. I did very little those few days. I saw them killing two fish together last evening, and lower down the river, at Kilsheelan, the cotmen there got seven fine salmon also in the one draw. Notwithstanding the easterly wind the trout fishing has been very good. Mr. W. Bagwell and Captain Morton killed 24 trout on Marlfield pond. Major Chambers, 22 on the stream called the Lenawn; Mr. W. Riall and Mr. Park (18th inst) two dozen on the Anner. Tom Rower has been very successful, killing large trout down the river, when he caught some white trout, which very seldom come up near Clonmel. Tim Kelcher and Tom Neil got 57 trout on the Nire. The fish on that stream seldom exceed half a pound in weight, but one of 7 lb. was got there some time ago on a night-line. On Good Friday Mr. Bradford had some good sport at Grove stream, filling the largest sized basket, and on the same stream Mr. Newman and friend killed a few dozen each of very large trout, and on the Anner Mr. Haines had some good fishing where he hooked a salmon on a small trout fly which ran out all his line, and even after breaking the top of his rod, still gave great play, but ultimately broke away. Mr. Frank Wayland killed some fine trout on the Suir, and killed one at Dudley's weighing 1 lb., which was in splendid condition. The silver black hackle hare's-car and gold wren are best flies for present fishing.—DORA.

There is a change in the wind this evening; it is inclined for the north.

Swale.

In my notes of last week I forgot to add that visitors to this stream must go well up the Dale, as the fish below Gunnerside were last season nearly exterminated by the bursting of Moss Dam. Monkey, Thwaite, or Keld should be the headquarters. The latter place is the best for sport, but the fish at present are in somewhat indifferent condition. After the glat of the stone fly (locally called May fly) they soon get into prime order. Suitable lodgings will be rather difficult to get, but the landlord of the Miners' Arms, Keld, will probably be the most likely person to apply to.—THOMAS FORD.

Waveney (Beccles).

Since writing last week the aspect of affairs has changed materially; and the water, which then was nicely clear, is now muddled and turbid. Winter has come upon us again in full force; and, as I write, the snow is falling heavily, and, with the wind in the north-east, all prospects of sport are at an end for the present. On Good Friday a great number of anglers took advantage of a nice day, and some very good takes were the result. Mr. Chase, angling in the middle of the day, took 11 lb. 5 oz. of roach; Mr. W. Gill, whilst angling with worm for perch, hooked and landed a jack of nearly 2 lb. weight, besides securing a nice basket of perch and roach; Messrs. Saul and Lee also had a nice basket of 44 roach, but they were not weighed. A great number of trailers have been out trying for pike during the Easter holidays, but with very little success. I understand, from a letter in a local paper, that liggering, although illegal, has been carried on here, and the attention of the water-bailiff has been called to the fact; so that the "gentleman" had better beware.—C. B.

Wye and Derwent (Derbyshire).

The Easter holiday piscators have had a very middling time of it during the week, owing to the sudden change in the weather again; all the week the weather has been bitter cold, with a piercing north-east wind and frequent snow-storms, which have quite taken the trout off the rise. We have had a very great number of anglers down here in Derbyshire from most of the manufacturing towns, trying their skill amongst the trout and grayling on both the Wye and Derwent, and their takes, as a rule, have been only a few brace. The best take was on the Derwent, last Monday, with the artificial fly—4½ brace of good-sized trout, three of the fish nearly 1 lb. a-piece. There have been a few brace of both trout and grayling killed on the Wye, between Rowsley and Bakewell. The killing flies have been the bumble claret body, furnace and spider flies. Trolling with the Derby trout-killer has been followed with fair success on the Derwent; one gentleman having two brace of good-sized trout, one of the fish weighing 2 lb. 6 oz. The worm fishers have killed very few fish during the past week. Sport on the ponds has been much better than on the river during the week, and some fine baskets of trout have been killed with both fly and bottom fishing. The killing flies for pond or brook fishing have been the bumble, red spinner and spider flies.—GEORGE JAMES EATON.

Yore (Yorkshire).

My joy last week at the welcome change in the weather, which I believed had just come in time for the Easter anglers, was short-lived, for on Monday the wind had veered round into the old quarter, with a running accompaniment of sleet and hail by way of variety. On Friday I made up a fair dish of trout with minnow, but it is full early yet for that bait, and the fish come very short at it. Saturday was rather warmer, and on that day I caught ten nice fish with fly, the blue dun being the favourite fly. Sunday was a glorious day, with lots of natural flies on the water. I saw a few March browns, and any quantity of blue duns and little browns. I know my fingers itched to be at them when I saw an extra good fish sucking them down. Monday and Tuesday were awful days. I braved the elements, but after two hours of it gave up in disgust. A worse season than this has been, so far, would be difficult to conceive, only another month being left for spring fly-fishing. I expect it will be the end of May almost before the stone fly comes on the water. It is a very killing bait on the Yore, and takes the place of the green drake, which is very little known on that river. At the time of writing the water is very low and clear, and a north-east wind fit to cut you in two prevails, so that until some further change in the weather takes place it will be merely waste of time to attempt anything at fly-fishing.—FRANCIS M. WALBRAN.

NORWICH FISHERIES EXHIBITION.—Messrs. Little and Co., Fetter Lane, Fleet Street, London, have been awarded the gold medal and diploma of honour for general excellence in fishing tackle at the above exhibition.

GREGORY'S SPINNING BAITS.—"The Gregory," the "Flexible Cleopatra," the "Oxford," and the "Colorado," pronounced by all Anglers and the Press the best baits invented for salmon, trout, pike, and perch. To be obtained from all respectable fishing-tackle shops in the world, and wholesale from Messrs. S. Allcock and Co., Standard Works, Redditch. Flattering testimonials speaking of the efficiency of the baits have been received from the Right Hon. John Bright, M.P.; Mr. William Bailey, Nottingham; the Rev. E. C. Holt, Teddington; Sir William Calder, Kingston-on-Thames, &c. Gregory's registered Archimedean spinning tackle for pike and trout, now ready, is pronounced by the press the best ever invented. For use with dead bait. The tackle is complete in every respect, and can be adjusted to suit bait of any size. Has been tried with remarkable success.—See that the name "Gregory" is impressed on the Archimedean fins, as inferior imitations are offered for sale, and people are thereby disappointed and deceived. Address, James Gregory, Vyse-street, Birmingham.—[ADVT.]

FISH-CULTURE AT CHERTSEY.

THE remarks of "Consistent" on this interesting subject dovetail so closely with my own experience that I trouble you with a few lines by way of illustration.

For the last five years I have been endeavouring to stock a small beck in this neighbourhood with trout. I brought the first instalment from Derbyshire in 1876, since which time I have put in fry of my own hatching as well as supplies from Mr. Capel's, of Foot's Cray, Kent. In 1879, a friend of mine also added a contingent of 60 full-grown fish, which he placed two or three miles down the stream, where the bottom is chiefly sand. Now, what do we find? Not a single trout remains on the lower reaches of the stream. They have all gone upwards to the gravelly swims in which they so much delight; and, depend upon it, if Mr. Forbes turns his trout adrift at Chertsey, as soon as the water of Father Thames wets their gills, the race for Gloucestershire will commence. Comparatively few will run the gauntlet of the many enemies on the way, and but fewer still will return to the neighbourhood in which they were hatched.

We cannot speak too highly of the commendable efforts Mr. Forbes is making, but natural laws will ever prove stronger than our hopes. I always place my fry at the fountain-head, and am gratified to find that, as I expected, the fish drop down lower as they grow in size. In this way, when the upper parts of the stream are stocked, I also hope that the lower runs will likewise be reached by the fish.

Strange though it may seem, I believe that the nearer Mr. Forbes puts his fry to the Cotswolds, the better it will prove in the long run for Chertsey.

THOMAS FORD.

Caistor, Lincolnshire.

THE CLASSIC ISIS.

THIRTY years ago the Isis and tributary streams within the City boundaries at Oxford were almost exclusively fished by the Beesleys. The "city stone" eastwards is reached by barge from Christ Church meadow, at about perhaps a third of the distance to Iffley and is placed on the Berkshire bank of the Classic Isis. A bottle of port wine is broken upon this stone on "perambulating" days. Some of the upper-class 'Varsity servants, and a few other freemen anglers never thought of trying their own city waters—they mostly repaired to certain portions of the Cherwell, in which they had permission to angle, or paid for the privilege. And there is excellent water not only at, but above Oxford, for the preservation of trout, &c. Among the numbers of pike and other common fish exhibited by the Beesleys for sale in the public market, I never saw a single trout! I knew there were trout in the water—by Osney Mill, for instance; but probably when the above well-known "freemen" family got hold of an Isis trout in their nets they had no difficulty in "placing" it at a tolerably high figure.

The Oxford anglers have, I believe, since altered that unsatisfactory state of things; and the city waters are happily no longer the monopoly of one or two netting families. From the city "stone" right away to Godstow, just beyond Port Meadow, is a fine stretch of the "freemen's" water, in every way suited for a large stock of fish. Unfortunately, Oxford is often flooded; and how any Parliamentary legislation can alleviate this state of things hereabouts it is difficult to conceive.

Don't blame the "upland" farmer for his drains,
Nor tax "the early or the latter rains."

The local anglers in these better days must know that a large number of fish get flooded out of the Isis and tributaries, and when the floods subside many fish get into the deeper ditches and the railway dykes, and these ought to be put back into the main

river. Besides, there is the Canal, affording additional water for the angler. From Sandford to Nuneham and Abingdon, good perch, &c., fishing, could always be got; and the Cherwell, too, might possibly be open here and there at a nominal charge? The crayfish in some small watercourses at Oxford run very fine and numerous, for I have myself caught as many as 250 to 300 sizeable crayfish in a single evening, say from dusk till 11 o'clock p.m.

In Worcester College gardens (how the bare mention of this delightful spot calls up sunny memories of "Commemoration" week, when so many of the youth and beauty of our land meet in the open air amidst this loved retreat!) In these gardens is a spacious lake, and it doubtless holds a lot of fish. I don't know whether any of the Fellows or Undergraduates ever angle in this water? If not, permission might possibly be got of the College authorities to net the lake for the benefit of the Isis and the city anglers. A visit to Oxford at any time is pleasant. It might be made doubly so, if the angler, after making a loving pilgrimage among the ancient and beautiful Collegiate establishments, the libraries and "schools," the Sheldonian Theatre, the Martyrs' Memorial, the Taylor Gallery, and the churches, he could repair to the Isis and ply his angle for awhile. The readers of the FISHING GAZETTE would, I feel certain, be greatly interested if any brother angler at Oxford would send a few notes as to probabilities in the way of trout and the "close season," &c., in the "city waters." The concessions made by the railway companies will enable London and other anglers to indulge in the luxury of visiting this notable city and University, and to ramble about her classic precincts.

The famous "High" hath many graceful bends,
And all that ancient Art to beauty ever lends!
Fair Italy sent forth that true "Rasonic" band,
That reared a wealth of Gothic fanes in our lov'd land.

W. F.

THE GRESHAM ANGLING SOCIETY.

AMONGST the one hundred and thirty-five London and suburban angling clubs, this new society has already attained a high and satisfactory position. With the Right Hon. Lord George Hamilton, M.P., as President, a substantial committee of nine City gentlemen, Mr. J. G. Thompson as treasurer, and Mr. J. Crumplen as honorary secretary, it cannot fail to take a leading place as a representative angling society. The Committee has just issued the rules and regulations under which the Gresham Club is to be governed, its object being for the purpose of fraternal intercourse among anglers, and strictly promoting the advancement of the art of angling." The present quarters are at the City of London Larder, 19, Throgmorton Street. The subscription is one guinea per annum, the Committee having power to elect as honorary members distinguished anglers or persons who may have rendered important services relative to fish and fishing. In all competitions for gross weights the following standard is given for weights and measurement: Jack, 3 lb.; barbel, 2 lb.; Thames trout, 3 lb.; brook trout, $\frac{1}{2}$ lb.; roach and rudd, 4 oz.; chub, 8 oz.; bream, $1\frac{1}{2}$ lb.; carp, $1\frac{1}{2}$ lb.; tench, 1 lb.; perch, 6 oz.; dace, 3 oz.; gudgeon, 4 inches. In other respects the standards of the Lower and Upper Thames are to be strictly enforced. The society has become affiliated to the West Central Association so as to enjoy the advantages of privilege tickets. The members are respectfully requested to give the Committee notice of any incivility or overcharge on the part of boatmen, and a list of trustworthy men is to be kept at the Society's rooms. Arrangements are in progress by which the Society will, if possible, rent water and possess exceptional rights in other cases. The latest information as to the state of the

ivers, fishing prospects, &c., are to be posted at the Society's committee-room during the season. The Society is to possess a library of standard works on angling and kindred subjects for the use of the members. It is therefore evident from these practical arrangements the members of the Committee will not be an inactive body; that whilst encouraging angling on true and sportsmanlike principles, they intend to obtain all the privileges they can for those associated with them. There can be no doubt such a first-class society was needed in the City, and that it will embrace amongst its members some of the best London anglers, such names as Messrs. Alfred Jardine, Thomas Spreckley, John Knechtli, H. L. Rolfe, Benjamin Slater, E. Frost, J. O. Chubb, H. J. Alfred, E. Blank, T. S. Davy, F. H. Lemann, C. Bentley, R. King, &c. &c., being prominent as leading City Thames anglers, and likely to join its ranks. All must wish the Gresham Angling Society every possible success!

DESTROYING SALMON FRY.

AT the Christchurch Petty Sessions on Monday, Charles Harrison, fisherman, of Mudeford, and George Scott, fisherman, Bournemouth, were charged, under the 14th section of the Salmon Fisheries Act, with selling, and exposing for sale, the young of salmon, at Bournemouth, on the 17th March. The proceedings were taken by the Conservators of the Avon and Stour fishery district, at the instance of Mr. Thomas J. Mann, of Fulton Hall, Norfolk, who saw three fish exposed for sale in Scott's shop at Bournemouth. When questioned respecting them Scott said they were "budge," and that he bought them of Harrison as such. Mr. Trevanion, who appeared for the prosecution, explained that budge was the local name for sea-trout, and belonged to the genus salmon. The proceedings were taken in the interests of local fishermen, and not from any feeling of animosity towards them. He quoted from the fourth annual report on salmon fisheries by the late Mr. Frank Buckland, who said the fishermen in the neighbourhood of Christchurch were acting directly against their own interest, inasmuch as they destroyed large quantities of young salmon every year in nets, which they used for catching flounders. By this means, he added, they were seriously injuring their own pockets; it was as "foolish an act as slaughtering and throwing away chickens with their feathers just appearing, instead of allowing them to grow into poultry worth seven shillings a couple." Mr. Mann, in giving evidence, said he had never met with a body of men more ignorant of their best interests than the Christchurch river fishermen, who, if not checked would as surely bring themselves to poverty as the Poole fishermen did with regard to the oysters.—The magistrates fined the defendants in a nominal penalty, but cautioned them against the disastrous consequences of the practice.

THE TROUBLE THAT BIG TROUT BROUGHT.

WE were rolling along comfortably on the Mid-Wales Railway; there had been but three of us to tenant the smoking carriage for some time, and, although all strangers to each other, we had grown very chatty and companionable, but now as the train drew up and admitted a fourth, the conversation flagged—grew less and less—and finally came to a dead stop.

It might have been that we were absorbed in the contemplation of the scenery, and truly, although the writer has travelled far and wide, he knows no line of rail so fraught with beauty, no district so charming, as lies all around Llanidloes, Builth, and Rhayader.

We may well have ceased our "palaver" to gaze forth in rapt admiration upon the undulating hills, just beginning to show

pink and purple with the earliest blooms of heather, with here and there a patch of golden gorse; whilst ever and anon the grey rock comes cropping through, its stern outlines softened down by masses of waving ferns. And amidst it all runs the "devious Wye," following the line for miles. Now it is lost for awhile amidst dense, hanging woods—now it comes forth again into the open, rolling along so smoothly that the white clouds sailing lazily far overhead are mirrored on its placid current—now chafing and brawling amidst the rocks and boulders which impede its course, as if impatient at the obstruction—now rippling along, chequered with foam-flecks from the last struggle, or forming deep, dark pools, in which the merest tyro in the gentle art must long to cast his fly.

It is all very beautiful, but I do not think it was this alone which held us silent. It was rather the advent of the new-comer. And yet there was no tangible ground of offence about this personage, if we except the pair of well-worn leather cases which he carried, one in each hand; and speaking very forcibly of the traveller in the "book line."

I think this made us rather shy; for, I suppose, we all have me more than once in our lives, the very plausible individual who, no matter what the topic of conversation may be, invariably leads it round to one point.

You may be talking of Russian politics—the last amiable deeds of the Irish Land League—the High Church revival, or what not—yet still he contrives to lead up to the good fortune of the present age, an age in which literature, by the enterprise of sundry publishers—literature of the very best and most instructive kind has been placed at a nominal price within the reach of all. Whilst the nimble tongue has run over this invariable preamble, the equally nimble fingers have opened the samples; and, unless very strong-minded indeed, you find yourself committed to "Fussell's People's Educator," in two hundred parts at sevenpence a month.

He may not have been a book agent, but I am sure we put him down for that; and, on the assumption, he was favoured with a scowl from the most talkative of the party, a short, thick-set man, with a red face fringed with iron-grey hair, a portentous shirt-collar, a pompous manner, and coarse, strident voice, fond of oratorical sentences, and whom I had set down in my own mind for a country solicitor or an auctioneer and the terror of the vestry.

The new comer did not mind the frown much, as he took his seat opposite. He did not even seem to see it, and, as he proceeded to charge his pipe, I had leisure to observe him.

A small, meek man; with a general air of dejection—a poor man, undeniably. That was evident in his coat, which had seen its best days a long time ago—in his carefully-brushed hat, with the tell-tale white marks about the brim; and, most of all, in the boots, where the ravages of time set Day and Martin at defiance; and in one of them a yawning crack had been artistically treated with a splash of mud. Yet there was something about the man which spoke of a better time. He might have been a gentleman once—nay, despite the frown of fortune, might in all save wealth, be a gentleman still. His hands were clean and well-tended, and his pipe—it was merely a cheap "briar"—and he smoked exceedingly bad tobacco—was, perhaps with some reminiscence of the ease of other days, exhumed from a little bag, evidently home-manufactured from a scrap of an old macintosh coat. He had given us a mild smile on entering, and had mentioned the fact that it was a fine day; and, more shame for us, no one had responded; unless the auctioneer's grim look counted for anything. So, after this, he smoked in silence, and with the slow, gentle puff of one who gets all he can out of a pipe.

We rolled on, and, still in silence, until the stranger broke it with, "Ah! Well landed; and a nice fish too" and, following

his glance through the window, we saw an angler just transferring a speckled trout to his creel.

A trifling incident in itself, but enough to change the entire man before us. His eyes seemed to brighten, his subdued manner to vanish as he watched the fisherman until the trees shut him from view. He appeared for the nonce to forget all his troubles, and surely they were not a few. As the thought came forcibly to my mind: "Here is a born disciple of old Izaak, if ever there were one."

"I do not angle myself."

It was our friend the auctioneer who spoke; and he commenced with a loud portentous "Hem!" which I had already learned to interpret as a prelude to a few of those long polysyllables he was so fond of. "I do not angle myself. My occupations are too multifarious to afford leisure for such relaxation. But it seems to be a pleasure-bestowing pastime—an agreeable and health-giving recreation—least to be condemned, perhaps, of any field sports, and it has often occurred to me that it would be a good thing if people in general, especially the rising generation, took more interest in fishing."

"The saints forbid!"

The voice of the last comer uttered this aspiration, and in something very like a tone of horror. He had, perhaps, intended to say more; but his fervent ejaculation had brought him into such prominent notoriety that, being a shy man, he shuffled uneasily in his seat and murmured, "I beg your pardon!"

The auctioneer was not going to let him off in silence. His brow contracted in an ominous frown, and he gave one or two gulps in his throat, as though swallowing sundry lumps of indignation.

"You beg pardon, sir, and not unnaturally. But let that pass. Only, I must say, that when any one utters his opinion, for another a—a—gentleman" (he blurted out the word sorely against the grain, evidently) "to controvert it so very abruptly, and with an expression which, excuse me, savours somewhat of Papistical idolatry, seems, to say the least of it, somewhat in bad taste."

"You are quite right," answered the other, "and I apologise again. I meant no offence. I was thinking only of myself. I am passionately fond of fishing, and—and—I curse the day I ever took a rod in my hand. Fishing—successful fishing, understand me—has been my ruin. I wrecked all my prospects, brought myself to what I am, by the capture of one wretched trout. But there," and he smiled sadly—a smile sufficient to disarm all resentment, "there, I am growing egotistical. Why should I bore you with my troubles?"

"Pardon me, but, I think, in the name of our fellow-travellers, I must ask you to continue now. You have excited our curiosity, it would be unfair to refuse to gratify it.

The speaker was opposite the writer of this narrative. A very portly gentleman, say of about fifty years of age, and a commanding presence. There was an air of wealth and dignity about him which had struck me from the first. If he had proclaimed himself the owner of one of the many splendid seats on the river's banks, or of half-a-dozen of them, it would not have been surprising. But I had settled him in my mind for something connected with the Church and State, and that kind of thing—possibly a bishop travelling incognito. I am well aware that high dignitaries of the Church are not often found in the third-class smoking compartment, but there was a sort of consciousness of power about the man which seemed to dwell in each crease of his fine black broadcloth and snowy linen, and upon the very curly brim of his extra glossy hat—the evident air of one accustomed to speak and be obeyed—that rather favoured the bishop theory, and made me so loath to relinquish it, that the reader must please to let me hold this fancy in speaking of him,"

"I am sure that there must be a story behind. Will you not favour us?"

The book-agent, for such he really was, looked at the speaker with a glance which was half surprise. Perhaps it was so long since any one had taken an interest in aught belonging to himself that he suspected a jest. But the bishop's face only beamed kindness, and a grave, old-fashioned courtesy, which set the other at his ease at once.

"You are right, sir," he answered. "There is a tale, and a sad one. I fear it is not very entertaining, but, at your wish, it is yours. I will commence by asking if you think it possible that a man's destiny can take an actual concrete form? Because all my evil genius came to me in the shape of a two-pound trout."

The bishop shook his head, as one who gave up a hard conundrum. The auctioneer, only half appeased, muttered something about "hating metaphysics," and the writer kept his eye on this strange man, with some growing suspicions of his sanity.

"Well, then, let me explain," he continued. "So, to begin at the beginning, my name is Reginald Fitz-Eustace Fipps—a peculiar combination, I admit," for we could not hide a half-smile, "but I cannot help that. My respected parents are responsible for the one part, and the other rests with antiquity. Reginald Fipps is an unlucky man.

"About eight years ago, at twenty-one, I found myself very much like Job at the lowest stage of his memorable career, about as badly off as possible. A series of disasters, with which I will not bore you, had left me with a widowed mother, very little money, and no visible means of getting more.

"I had been destined for the Church, but my college career was bought to an abrupt termination, and there was an end of that. Of course, I was in love, and engaged to be married, as every woe-begone wretch always is; equally there was an end of that. Although," and his face grew more hopelessly sad; "heaven bless her! she waits for me still."

He paused a moment to steady his voice, and then went on in quick defiance of our sympathy.

"It was but little I could do. My classical education was at a discount in the jostling, money-getting world, and, bit by bit, things grew worse. There came a gleam of hope in an invitation from my mother's brother, and a confirmed bachelor, for me to visit him. I was at first inclined to refuse. I had never seen this uncle of mine. He had always held himself aloof from us, and, despite his wealth—he was very rich—had proffered us no assistance. But my mother would not hear of it. With all of a woman's hopefulness, she at once decided that this was the prelude to making me his heir, and go I must. I yielded. Perhaps the knowledge that he had a capital trout-stream on his estate near Carmarthen, had something to do with it; for I was always passionately fond of angling. At all events, I went. He received me well, and made me very welcome, and we found a genial topic at once in our mutual taste for fishing. I had not been in the house half-an-hour before he commenced showing me all his tackle, and although he had enough to stock a moderate shop, I was not slow to perceive he possessed but a small knowledge of how to use it all. However, I was wise enough to keep this to myself. Alas! that my wisdom did not suffice to also hide my own superior skill. After dinner he took me in the calm of the summer's evening to see his water, and a charming stream it certainly was. A rapid dashing brook, almost large enough to be styled a river. Full of nice rippling runs and swirling eddies. Wooded in places, but not enough so to be troublesome, with there and there a deep dark rock pool. Every yard of it, and he owned more than two miles, had its history, and he never wearied of the recital. By his own account he had done great marvels; but I did not intend to offend him, and listened

with a fair share of credulity to the most astounding angling exploits it has ever been my luck to hear. But as we wended home again approaching one spot his voice lowered to a whisper, and his step grew slow and solemn. An expression came over his face akin to that of a great picture connoisseur, as he drew aside the curtain protecting the cherished old master, or the enthusiast in china producing the rarest bit of Buen Petiro or exquisite Meissen. 'There,' said my uncle, and his hand laid on my shoulder drew me behind a sheltering bush, 'You do not see a fish like that every day.'

(To be continued.)

WORCESTER ANGLING SOCIETY.

THE seventh annual dinner of the Worcester Angling Society was held at the Bull's Head Inn, High Street, on the 8th inst. Mr. B. Smith occupied the chair, and Mr. A. E. Davis the vice-chair. The company present included Messrs. G. Dyer, E. D. Davies, J. A. Griffin, J. Hodnet, A. George, H. Tyler, A. Barrs, W. Philipps, C. Price, J. Shaw, J. Jeff, W. Roberts, T. Roberts, J. Wayne, W. Pugh, W. Prosser, W. Handley, J. Phillips, and J. R. Pool (secretary).

"The Queen" having been proposed and honoured, The Chairman gave "Success to the Worcester Angling Society." The society had now been established over seven years, and, although it had had its ups and downs since its formation, it was at present in a very satisfactory condition. The season was about to commence, and he hoped the members would pull together. He would like to see the club meetings better attended. (Hear, hear.)

The Secretary responded, and read the prize list for the past year. This was the first year he had been secretary, and since entering upon his duties he had done his best to look after the interests of the society. (Hear, hear.) With such advantages as they had in the Severn, Teme, and their various tributaries, he saw no reason why the Worcester Angling Society should not become one of the best in the country. They had at present 62 members on the books, and a good balance in hand to commence the season with.

The following was the prize list:—For the greatest aggregate weight of fish caught during the season—1st, silver cup and fishing stockings, Mr. Barrs, weight 250 lb. 3 oz.; 2nd, £1, Mr. E. D. Davies, 94 lb. 1 oz.; 3rd, 15s., Mr. A. E. Davis, 52 lb. 10½ oz.; 4th, Mr. C. Price, 29 lb. 5 oz. For the greatest aggregate weight of game fish (trout or grayling) caught during the season—1st, Mr. E. D. Davies, 69 lb. 13 oz.; 2nd, Mr. Barrs, 65 lb. 12 oz. For the best brace of trout, Mr. J. A. Griffin; 2nd, Mr. Gillham. Heaviest brace of trout caught with any other bait, a tie between Mr. E. D. Davies and Mr. A. E. Davis. For the heaviest basket of perch taken in one day—1st, Mr. Barrs, weight 21 lb. 4 oz. Heaviest pike, Mr. C. Price.

It was mentioned that the quantity of fish weighed in during the past year was very satisfactory, considering the extent of water the society had the right to fish over.

The Secretary said that some dissatisfaction existed with regard to the discontinuance of prizes for the destruction of otters. There could be no doubt that the destroying of otters was an advantage to anglers, but it was unreasonable to ask a club numbering sixty members to give prizes to an object which would benefit the 4800 anglers who took out licenses to fish last year.

The Chairman mentioned that the funds which were set aside for these prizes were now exhausted.

Mr. George referred to the fact that the club had not been assisted in this matter by either the Severn Fishery Board or other angling clubs.

Mr. H. Tyler, in proposing "The donors of prizes," said that the giving of prizes was a great incentive to anglers. He hoped the club would be able to show a better prize list next year. (Hear, hear.)

Mr. G. Dyer responded.

The Vice-Chairman proposed "The Health of the Chairman," observing that Mr. Smith had been president of the society ever since its formation, and the success of the club was in a great measure due to the energy he had displayed in its affairs. They all hoped he would long continue to occupy the post he had so worthily filled.

The Chairman replied, and thanked Mr. Davis for his complimentary remarks. Ever since he first became a member of the society he had done his best to keep the club together, and to increase the number of members. Although he had not weighed-in during the past season he had not been idle. He had caught 153½ brace of grayling, weighing over 200 lb.—(hear, hear)—and over 100 lb. of white fish. (Hear, hear.) He might mention that the reason he had not weighed-in as usual was that he wished to give the younger members of the club a chance of becoming prize winners. (Applause.)

The Chairman next gave the health of the late secretary, Mr. Albert George, who had for some years acted as secretary to the club, without any reward, but on account of other duties was obliged to give up the position. He had always worked hard in the interests of the society, and the members were much indebted to him for his services. (Hear, hear.)

Mr. George thanked them for the very kind manner in which they had received the toast, and said it had always been his desire to further the interests of the club, and he hoped it would long continue in its present flourishing condition. Although no longer secretary, he should continue to be a member of the club, and to look after its interests.

The Chairman announced that the officers for the ensuing year would be elected at the next club meeting, and the season would commence on the 15th inst.

"The Vice-Chairman," proposed by Mr. J. Jeff, and "The Host and Hostess," concluded the toast list, and the remainder of the evening was spent in singing and conviviality.—*Worcester Journal*.

TO ANGLERS.—W. J. Cummins, Fishing Tackle Maker, Bishop Auckland, is now prepared to forward to anglers his Illustrated Catalogue, which is not only a Trade List but is interspersed with practical hints, useful directions, and valuable information gathered by the river-side from twenty years' experience. The stock consists of his unrivalled Salmon, Trout, Grayling, and Pike Rods, Lines, Reels, Baskets, Artificial Baits, Fly-books, Landing Nets, Gaffs, and last, but not least, his celebrated Trout Flies, which for killing powers stand unequalled. Every article kept in stock is of the very best description.—[Any.]

CORRESPONDENCE.

[We do not hold ourselves responsible for opinions expressed by our Correspondents.]

SINGULAR CAPTURE.

SIR,—I was fishing in the Fareham Stream, near Boarhunt, on Good Friday, and had killed two and a half brace of trout, when a moor hen flew out from some bushes near me. Giving the rod a twitch, I hooked her by the

She gave me some good play for about ten minutes, but by keeping a gentle pressure on her, I at last brought her to bank, and a friend who was with me got her out.—I am, &c.,
JAMES TAYLOR.

ANOTHER CURIOUS INCIDENT.

SIR,—Mr. Wesley Warner's letter about the resurrected frog, reminds me of a somewhat similar incident. When fishing with James Rogers sen., for whiting pout—here called "Blains"—one evening last summer, Rogers hauled a fish to about mid-water, when he lost him. On examining his hook he found on it a garden snail minus the shell. When we got ashore we found on enquiry that two men had been out at the same place early in the morning, who, having no mussels, had used snails—deprived of their shells—for bait.

As the snail looked quite fresh after having done Jonah for so many hours, it seems probable that they are not so easy of digestion as they are generally supposed to be.—I am, &c.,
E. GOSLING.

Budleigh Salterton, April 11, 1880.

THE GRAND JUNCTION CANAL.

SIR,—Could you inform me through your paper whether it is really true that the West Central Association has given up the preserving of the Grand Junction Canal.—I am, &c.,
H. GREENWAY.

The Firs, Cricklewood, April 9, 1881.

[We believe the Association had to give up the idea of preserving, as the Company would not prohibit netting.—ED.]

FISHING NEAR TUNBRIDGE WELLS.

SIR,—In answer to your correspondent of last week I may state that there is very good pike fishing in the Medway, at Tunbridge, which is four miles from Tunbridge Wells; that is the nearest. The Medway affords good sport and the water is directly under the auspices of the Tunbridge Angling Club.—I am, &c.,
EDWARD HOLLOMBY.

THE CLOSE SEASON.

SIR,—A number of your correspondents, Thames, Trent, and other rivers (practical anglers), are now convinced the close season (against the rods) for coarse fish, is much too long.

Your correspondent "B" makes a capital suggestion. I trust the heads of the three associations will take the hint.

I wish to point out unless anglers are able to follow their favourite pastime through March, April and May, the clubs, as well as tackle makers and others must in the end suffer; they cannot expect many anglers to attend club rooms merely for harmony or card parties. If another meeting were held it would be found a great alteration of ideas has taken place.

I, for one, feel certain a plan might be found to answer to shorten the close season, say, for instance, fish that are caught with a live bait, as jack, etc., might be fenced a month earlier than bream or roach, and no harm would be done. If it answers for trout, why not for other fish?—I am, &c.,
F. M.

"FOSTER FUND."

SIR,—I beg to acknowledge with thanks receipt of 10s. from Clapham Junction, 19s. City of London, 9s. Sir Hugh Middleton, £2 11s. 6d. Good Intent (20s. given from the funds of their society, remainder subscribed by the members). Secretaries are respectfully requested to send in their collections at once.—I am, &c.,
T. HOOLE, hon. sec.
7, King's Road, Mortlake.

SIR,—I beg to acknowledge the receipt of 10s. 6d. from the Canonbury Angling Society, and 12s. from the Hoxton Brothers with thanks. Those secretaries who have not yet sent in their lists for the above fund will oblige by forwarding them forthwith.—I am, &c.,
R. GHURNEY.

FEEDING OF SPAWNING FISH.

SIR,—I quite agree with your correspondent "Fish and Sportsman's Friend" referring to your correspondent Mr. William Bailly respecting "Feeding of Spawning Fish."

It was only yesterday, April 9th, that I was out fishing. The only fish I got were grayling, and they took my fly which was a "small red spinner," most freely. In about an hour I had caught four brace, but of course had to put them back as this is their spawning time.

Has Mr. Bailly ever tried fishing for grayling when they are spawning? If so I am sure he will find that this fish will bite during spawning season.—I am, &c.,
ANOTHER "FISH AND SPORTSMAN'S FRIEND."

April 10th.

FISH-HATCHING AT CHERTSEY.

SIR,—Had B.'s first letter held one quarter of the qualified statements and equivocal admissions which does that in your last issue, there would have been no occasion for me, in the cause of scientific truth, to have taken exception to its contents. The assertion so boldly made in the former, that "after many years of exertion to materially advantage the Thames by fish breeding," the worthy and enterprising Chertsey pisciculturist had, hey presto!—marvellous—attained that object, was of too extraordinary a nature to pass without surprise and protest. Indeed, so firmly therein is B. presumably assured of this stupendous achievement, that he declares emphatically that "there is nothing in the way of speculation as to this result being realised." "I am sure," he adds, again taking, figuratively, to the trowel, "that Mr. F." (I would avoid if possible

mentioning that gentleman's name) "must feel he has now arrived at perfection in fish hatching." This, I maintained, was a presumptuous assertion, as it was alone founded upon the fact that the eyes of the ova of the Thames trout were plainly visible, and the eggs looked strong. Had the writer of a leader in the *Standard* of to-day, the 19th inst., upon the opening of the Norwich Fish Exhibition been thus enlightened, he would surely not have written that "we still understand rather less of the culture of salmonidæ than about the electric light or the geography of Central Africa, and the craft is yet in its tentative or experimental stage, &c." And again, "Our nets are still very much what nets were at the time of the Pharaohs, whilst in pisciculture we have done strangely little."

I may here venture to state that our Chertsey friend, thus invested with the celestial attribute of Perfection, doubtless feels what a censure is thus cast upon his fellow labourers, and that he would be the first to reprove the flatterer, as no man is more ready to acknowledge that science is progressive, art long, and perfection unattainable, than he. But we shall see that the redundancy of superlatives in B.'s first letter was not altogether meant, although addressed, to that gentleman.

B. has obviously now learned that he had gone too far in hyperbole, although it seems, as we shall see, it was not altogether intended for the individual named, and thus present trimming may be accounted for. "Every one knows," he writes, "that there exist great risks in the raising of the fry, and great care is needful in bringing them up." While, further on, he steps more gingerly along a path of which he is so little acquainted, and says, with still more cautious reserve, "If we can only get through the period of infancy—I do not anticipate—neither will I anticipate—the difficulty of raising a goodly proportion of youthful stock." But why should B. "if" it thus? why should he even raise the ghost of anticipation having already announced perfection? and why, "if every one knows" this, did B. rest the certainty of success, inspired by perfection, upon the initial fact that the eyes of the ova were cynically winking at his credulity?

By comparing B.'s two effusions it will be observed that, since my remarks, there is no longer that tone of confidence, of certainty, and of perfection, which characterised his first prophetic outpourings. His last letter is dotted throughout with "ifs" and "hopes," and has therein this singularly speculative sentence, all speculation having been previously eschewed: "If only one-sixth of the young fry are raised." Is it possible that B. is so profoundly ignorant upon a subject upon which he hazards his pen, that he is not aware that there exist pisciculturists who would not consider they had reached perfection if they had lost 10 per cent. of ova and fry? Yet here does B. admit there may be a possibility of a sacrifice of fish-life to the extent of more than eighty out of the hundred—and yet he has no speculative doubt that perfection will not result!

But is there no personal reason for all this gushing homage in the Chertsey Fish Temple? Let us read the lines and between them:—"I have all along considered it a mistake to propagate the different species of salmonidæ which was first taken up by Mr. Frank Buckland, and at all times I have strongly advocated instead the increase of our own native fish, and particularly what is known as the Thames trout."

So, so—then it is not our esteemed friend at Chertsey that is reserved for the honour of the inception of this idea, but B.; in other words, the former is but working B.'s discovery (if it be his?), and, further on, B. alludes to "the duties in which we are engaged."

Let me here ask where and when B. has either expressed a conviction that Messrs. Francis Francis, Buckland, Ponder, Lowe, Lord, and others, were pursuing a wrong course, or, that he had "advocated the increase of our native fish, particularly what is known as the Thames trout"? As B. is, in general, his own reporter, he can have no difficulty of substantiating this claim, by a reference to time, place, and publication.—I am, &c.,
CONSISTENT.

CLUB REPORTS.

ANGLERS' BENEVOLENT SOCIETY.

The adjourned general meeting of the above society will take place on Friday next, April 22, 1881, at 9 p.m. Secretaries will oblige by forwarding to the general secretary the names of their members wishing to join the Anglers' Benevolent Society for the ensuing year, which will commence on May 1st.—R. GHURNEY.

April 19.

CLAPHAM JUNCTION ANGLING CLUB.

A special meeting was held on Monday last, and it was decided that the annual dinner take place on April 26. Among the new members that were made on Thursday I have much pleasure in stating that Mr. Willoughby, late chairman of the Battersea Piscatorial Society rejoined his old club again. Members are requested to attend on Thursday next for settlement of prizes and other important questions. Our two cases of beautiful bream will be on view then.—E. WILSON, sec.

CLAPHAM JUNCTION ANGLING SOCIETY.

The annual dinner will take place on Tuesday next, 26th inst., at the club house. I have much pleasure to inform our members that our two cases of bream has just arrived, which makes a great improvement to our club room. The fish, six in number, were taken by Mr. E. Withers, at Shepperton, one fish weighing 5 lb. 13½ oz., the other five, in one case, weighing 10 lb. 14½ oz., which makes two handsome cases. Among the new members that were made last Thursday was Mr. Willoughby, late Chairman of Battersea Piscatorial Society, who rejoins us again.—E. WILSON, hon. sec.
April 19.

HAMMERSMITH UNITED.

Our district visit took place on Thursday, April 7th, and which I am pleased to say was a complete success, the following clubs being represented:—Cambridge, Duke of Cornwall, Duke of Norfolk, Golden Barbel, Hammersmith Club, Maylebone, Norfolk, North-Western, Waltonians, Westbourne Park, Knights of Knightsbridge, Clapham Junction, Clerkenwell Piscatorials, Alexandra, Hampstead Club. The chair was taken by Mr. Dixon, of the Golden Barbel, faced by Mr. Hoole, of the Hammersmith United. The proceedings were opened with harmony, which was continued to a late hour. Among the gentlemen who took part in the proceedings were the following:—Messrs. Dixon, Hoole, Morris, Sutton, Starr, Penny, Franklin, Burgess (who was vociferously applauded), Lumby, Toms, Roberts and friend (in a burlesque), and last, but not least, the worthy host of The Rent Day, where the

Cambridge is held, wound up the evening with "Joe in the Copper." Among others, we were glad to welcome Mr. Lerner, of the York Minster, and Mr. Galloway, of the Norfolk Arms.—VORTEX.

THE LARKHALL ANGLING SOCIETY.

The series of musical evenings that have so substantially characterised the success of the Larkhall Anglers, and were inaugurated by the energetic president of the club, Mr. G. F. Spencer, were brought to a grand termination on Wednesday evening in last week, at the Larkhall, Larkhall Lane, Clapham. It was also made the occasion of presenting to those present—and the room was filled to an overflow—a copy of the annual report and balance-sheet, the publication of which is also a new feature in the history of the Society, and affording further evidence of the business-like character of the president. In the report the committee congratulate the members on the prosperity of the society during the past season, and its recent flourishing condition both in numbers and standing, no fewer than 21 new members having been enrolled. The annual subscription has been raised from twelve to sixteen shillings, and the entrance fee to ten shillings. An appreciation is accorded to the talented vocalists and instrumentalists whose distinguished and gratuitous services have enabled the worthy president to bring the musical evenings to so successful an issue. The committee invite the members to an inspection of the society's books to see how the money has been expended, although the balance-sheet details in full the various items of receipts and expenditure. The report, which is signed by Messrs. Charles Davison, Frederick Croutel, Benjamin Boyce, James W. Green, George Nicholson, F. Kerry and W. W. Westley, as members of the committee, and countersigned by Mr. W. Tucker, as honorary secretary, concludes with a renewal of their hearty good wishes on the success of the society. The balance-sheet exhibits a balance in hand of £16 19s. 6d.; since the occasion of the annual dinner when the sum of £50 was raised for prizes, the amount has been doubled, and everything therefore appears in the most prosperous condition. It only shows how courage and perseverance can be stimulated under an active and energetic president. If there is a noble and valorous leader, the committee, honorary secretary and treasurer become stimulated and more spirited in their work. The Larkhall Anglers will ever have cause to be thankful in their selection of Mr. G. F. Spencer to the office of president, and one and all must hope in perfect sincerity that he may long be spared to conduct the affairs of the society. As regards "the last musical evening," it was a grand success, and at the particular request of the president, Mr. W. H. Brougham, of the Thames Angling Preservation Society, was present on the occasion. There were also Messrs. J. M. Brougham (Piscatorial Society), B. Boyce, J. H. Morris, C. Davison, F. Croutel, J. W. Green, G. Nicholson, W. Tucker, W. Owen, J. Edmondson, F. Boyce, W. Spencer, Grumbridge, English, W. Creek (Union Hotel, Clapham), A. Creek, Watkins, Wise, Goode, Gordon-Laurie, Mallett, Burgess, G. Moore, Thoma, C. Broadlake, Silvester, &c., &c. The noble president, after transacting the ordinary business of the evening, became the musical director, and certainly Mr. J. F. Spencer feels equal for any emergency. Although there was no programme of musical arrangements, which has been customary on previous occasions, he was at no loss in making his calls. There were no delays in the response; all came cheerfully forward, and with unflinching interest the musical element was kept spiritedly up to the final close. Mr. W. H. Brougham was called upon to make some remarks about the Thames, but instead of making a speech or singing a song he entertained the audience with a scenic description of the recent conviction for fishing during the close season, commencing with the arrival of the anglers in the village at one of the Thames fishing stations, and ending with the trial scene before the magistrates, where the piscators pleaded guilty, paid the fines, and afterwards expressed their regret to the prosecutors. Mr. Brougham concluded, after giving an account of a couple of roach having survived after being imprisoned in a solid block of ice during the last heavy frost, by proposing, in highly but deservedly complimentary terms, the health of the president, to whom he felt much indebted for the thorough enjoyment of several very pleasant evenings. Mr. J. F. Spencer briefly but heartily acknowledged the toast, which, it is needless to add, was drank with great enthusiasm and with musical honours. It is impossible to give a full account of the musical portion of the proceedings, especially where all were so good. The first piece was "Turkish Patrol," which Mr. J. Hallé, of the Royal Aquarium, Westminster, performed on the piano with exquisite taste and effect. Mr. C. Broadlake displayed a sweet tenor voice to advantage in Archer's "Alice, where art thou?" and in the hearty encore which followed in "Limerick." Mr. G. Bruce, who is possessed of a capital voice, gave a tasteful rendering of "Down by the river side," and on being encored gave Loder's "Martin, the man-at-arms." Mr. Gordon-Laurie, who is a great favourite, sang several buffo songs with great success, the one of "Gracious, Good Gracious," being loudly applauded. Mr. Tucker in "The Stirrup Cup," Mr. J. Edmondson, in "The Four Jolly Smiths," and Mr. J. M. Brougham in "Jack's Yarn," were all well received. Several glees and part-songs were admirably rendered, and Mr. J. Hallé presided with his usual ability. Last, but not least, Mr. W. Spencer recited Aytoun's "Execution of Montrose" in a truly excellent manner, and with wonderful effect. His rhetorical powers are of no mean order, and his powers of elocution of a masterly character. When the closing hour arrived and "God save the Queen" gave the signal for breaking up, the large assemblage regretted so pleasant and delightful an evening had come to a termination, and that it was "the last of the season." A parting glass with the worthy host and treasurer sent all to their respective homes in the best of humour, and abundant evidence was afforded of the happy union and good brotherly feeling that exists amongst the Larkhall Anglers.—B.

LITTLE INDEPENDENT ANGLING SOCIETY.

The annual supper of the above society was held on Wednesday evening, April 13th, at the Russell Arms, Bedford Amphill Square—Mr. Pipe in the chair. A most substantial repast was provided, after which a very enjoyable evening was spent, the harmony being contributed to by several members of this society, and by members of the Odds and Evens Society, Great Northern Brothers, and other clubs, the rendering of several of the songs being especially good. In the course of the evening the chairman distributed the prizes won by the members during the past season, and amongst them being a handsome silver cup, the gift of Mr. Castle (a member of the society), and won by Mr. J. Blenheim. The health of Mr. Castle having been proposed and drunk in champagne, a vote of thanks to the chairman who had so ably fulfilled his duties, terminated a most pleasant evening.

UNITED LONDON ANGLERS.

The meeting of the United Committees of the Angling Associations will meet at the New Forester's Hall, Clerkenwell Road, E.C., on Friday evening,

April 29, 1881, at 9 o'clock, to consider the question of the ensuing yearage and other important matters for the benefit of the London anglers.—R. GHURNEY, secretary.

April 19.

WEST CENTRAL ASSOCIATION OF LONDON AND PROVINCIAL ANGLING SOCIETIES.

A special meeting was held on Friday the 8th inst., P. Geen, Esq., hon president, in the chair. The minutes of the previous meeting having been read and confirmed, it was proposed by Mr. Murphy, seconded by Mr. West, that the Gresham Angling Society be enrolled carried unanimously. Proposed by Mr. West, seconded by Mr. Star, that the St. John's Wood Piscatorial Society be enrolled; carried unanimously. Letter read from Mr. Rush of Goring, asking for remuneration for getting fish out of the ditches, near Reading, and putting them into the Thames. Letter ordered to be sent to the Reading and Bray Association, asking for further particulars. The case of wiring fish was referred to a select committee. The following gentlemen were unanimously re-elected to their respective offices, viz., Mr. Bonvoisin, chairman; Mr. Becket, vice-chairman; Mr. Hoole, secretary; Messrs. Townsend, Humphrey, and Fiddes, trustees; Messrs. Murphy, Field, Vincent, Ghurney, Welch, West, Star, and Castell, committeemen. Messrs. Giles, Fowler Noble, and Marshall were duly elected, to fill the vacancies, upon the committee, Mr. T. Osman, tiler. Messrs. Bonvoisin, Osman, and Becket, re-elected to represent the association at the meetings of the East Central Committee, and Messrs. Field and Fowler elected to fill vacancies upon same. Secretary was instructed to write to the Central Association asking them if they will appoint a committee of 12 to meet the same number from this association and also the East Central Committee in reference to the yearage be charged for the privilege tickets for coming season. Owing to the large amount of business brought forward it was impossible to get through the whole of it, so it was decided that the next meeting (May the 20th) should be a special one for the elections of auditors and other important matters. A cordial vote of thanks was accorded to the president and vice president for the able manner in which they had conducted the business. The following societies were represented:—Anglers' Pride, Bostonians, Bloomsbury Brothers, Cadogan, City of London, Clapham Junction, Cambridge Friendly, Cobden, Duke of Norfolk, Duke of Cornwall, Golden Barbel, Good Intent, Gresham, Hammersmith United, King's Cross United, Metropolitan, Marylebone, Norfolk, North Western, Penge Prince of Wales, Peckham Brothers, Royal George, St. John's, Savoy Brothers, Sir Hugh Myddleton, South London, Stanley Anglers, St. John's Wood, Trafalgar, United Marlborough Brothers, Waltonians, Westbourne Park. Mr. Ghurney representing the East Central Committee. A new list, containing the names and addresses of 125 angling societies, will be sent to those societies not represented, and it is requested that complaints be made to the secretary of the association in any case of non-delivery.

THE HUNGERFORD TROUT FISHERY.—The fly-fishing season opens on this noted water on Monday, the 2nd of May. The fishery extends for about five miles, and the "commoners" also possess certain rights of pasturage, besides the shooting of wild fowl bred within the area of their fishery. The old town of Hungerford was a well-known coaching and posting place over forty years ago. The Hungerford fishery, &c., were bestowed upon the town by John o' Gaunt. The very select club of gentlemen fly-fishers have done much to improve the fishery, without detracting anything from the ancient rights of the commoners to fish on certain days mutually agreed upon by the club and themselves. Grayling were tried here, but the experiment failed. But what freshwater fish can possibly compare with a Kennet trout?—SPOTS.

THEORY v. PRACTICE.—A Board schoolmaster the other day set up a black board, and chalked certain fishes thereon, so as to give his boys a notion of the sizes of fish. If the hopefuls went, however, to the canal side in some country towns they would soon learn the difference in fishes, and very likely hear a local sing out, "Jack! I kotched wun," and a bright dace or roach would be seen dangling on the hook like a lobe of burnished silver. Presently another hopeful would exclaim, "Bill! I got annuner! Don't they jest bite this arternoon?"—F.

ORMESBY AND ROLLESBY BROADS.—The season has fairly begun here. There has been some good sport of late both in pike and bottom fishing. A London gentleman on Saturday caught 110 fish consisting of roach, bream and perch, one perch weighing 3 lb.

GEORGE JAMES EATON, of Starkholmes Matlock-Bath, Derbyshire, respectfully invites Noblemen and Gentlemen to try his standard FLIES for the present season. No flies sent or made up but what he himself has proved sure killers. A trial is all that is required from gentlemen who can fish to prove whether they may be genuine or not. Patronised by some of the best fishermen of the day. All flies dressed on the best Kendal hooks. Prices: Point Flies, 2s. 6d. per Dozen; Dropper Flies, 2s. per Dozen. Orders punctually attended to.—[ADVT.]

DAY, SON AND HEWITT'S STOCKBREEDERS' MEDICINE CHEST.

FOR ALL DISORDERS IN HORSES, CATTLE, CALVES, SHEEP AND LAMBS.

In this chest are the following matchless and world-renowned remedies, all that a Farmer can require to cure disease amongst his Stock and keep them in fine, healthy, and buoyant condition:—

"CHEMICAL EXTRACT," for Wounds, Swollen Udders, and Ewes Lambing.
"GASEOUS FLUID," for Colic, Scour, and Debility.
"RED DRENCH," for Cleansing Cows and Ewes, &c.
"RED PASTIE BALLS," for Conditioning Horses.
"BRONCHOLINE," for Husk, Hoarse, or Cough.
"GASEOLINE," for Heaving or Paining.
"ALCOHOLIC ETHER," for Colds and Chills.
"CARMINATIVE CHALK," for Diarrhoea in Lambs and Calves.
Price of Chest, with "Key to Farriery," £2 16s. 6d., carriage paid. Each article can be had separately.

Patronised by Royalty, and used for over 40 years by the Leading Agriculturists of the British Empire.

CAUTION.—See that the Name of DAY, SON and HEWITT is on all Bottles and Packets.

DAY, SON AND HEWITT,
22, DORSET ST., BAKER ST., LONDON, W.,
AND WANTAGE, BERKS.

NOTICE.

Communications relating to the Literary Department, Fishing Tackle for Notice, Books for Review, &c., must be addressed to the Editor of THE FISHING GAZETTE, No. 12, Fetter Lane, London, E.C. and should reach the office not later than Tuesday morning.

Contributions are solicited, but the Editor will not undertake to return rejected MSS., unless accompanied with a stamped addressed envelope.

Correspondents are requested to write on one side of the paper only and give their real names and addresses, not necessarily as signatures to their letters, but as a guarantee of good faith. Unless this rule be adhered to no notice will be taken of such communications.

THE FISHING GAZETTE is published every Saturday, and can be obtained at Messrs. W. H. Smith and Son's Railway Bookstalls, and of the following, amongst other Fishing Tackle Dealers in London and the Provinces:—

Messrs. Alfred and Son, Moorgate-street.
Messrs. Price and Co., 8, Seymour-street, Euston-square, N.W.
Messrs. Williams and Co., Great Queen-street.
Messrs. Gee and Co., St. Andrew's-street, St. Martin's-lane.
Messrs. Gee and Co., Gray's Inn-lane (near Holborn end).
Messrs. Little and Co., Fetter-lane, E.C.
Messrs. C. Kewell and Sons, 197, St. John-street-road, E.C.
Messrs. Kewell and Co., 1A, Conduit-street, Regent-street, W.
Mr. J. Richards, 97, Church-street, Paddington.
Mr. W. Leader, 30, Upper Marylebone-street, Portland-place, W.
Mr. — Clark, 35, Wells-street, Camberwell.
Mr. Geo. Read, 91, Goldsmith's-row, Hackney-road, E.
Mr. A. Bulmer, 62, Wandsworth-road.
Mr. F. Oliver, 184, Great College-street, Camden Town.
Mr. J. E. Gold, 284, Waterloo-road.
Mr. D. W. Willoughby, 21, Lombard-market, Battersea, S.W.
Mrs. F. Y. Brocas, 4, Mill-street, Conduit-street, Hanover-square, W.
Messrs. Gillett and Co., 40, Fetter-lane, London.
Mr. Alfred Young, "The Golden Perch," 174B, Oxford-street, W.
Mr. T. Barnett, 26, Church Street, Lisson Grove, N.W.
Mr. J. Smith, 7, Tottenham Court Road, London.
Mr. Edwin Stevens, Newsagent, 220, Kentish Town Road.

Mr. S. Dale, 7, St. John Street, Nottingham.
Mr. H. Booth, 88, Prospect Street, Hull.
A. W. Warner, 121, Broad Street, Birmingham.

Newsvendors can obtain the journal through their London Agents.

*• The "FISHING GAZETTE" SPINNER (Registered) is sold by all the above firms.

ANNUAL SUBSCRIPTION.

The Annual Subscription, payable in advance, for the United Kingdom is 8s. ; or post free, 10s. 6d.

To any part of Europe, the United States, and Canada, the Annual Subscription, including postage, is twelve shillings and sixpence.

ADVERTISEMENTS.

All communications respecting advertisements must be addressed to the Manager of THE FISHING GAZETTE, No. 12, Fetter Lane, London, E.C.

N.B.—All Remittances must be sent, and all Cheques and Money Orders must be made payable to ROBERT B. MARSTON.

The Fishing Gazette.

SATURDAY, APRIL 30, 1881.

THE NATIONAL FISHERIES EXHIBITION.

THE success of the Fisheries Exhibition may now be said to be established beyond dispute. During the first week nearly 15,000 persons visited the Drill Hall, and over £1,000 was taken in the shape of gate money and by the sale of visitors'

tickets. As we write, the stream of sight-seers seems to be as great as ever, and we understand that the committee have determined to extend the exhibition for one week longer than was originally intended. The local and general public will therefore have a full opportunity of inspecting this remarkable collection of objects. It is interesting to observe that all classes have been represented among the visitors. Practical fishermen from Yarmouth and Lowestoft, and devoted anglers—to whom the exhibition and its contents are a continual feast—mingle with the throng of pleasure-seekers, who come for the music and the electric light and the thousand and one curiosities and rarities of the show. The occasion, moreover, has been one of profit as well as of amusement. During the week Professor Huxley has delivered one of his charming and popular lectures, and has treated the Norwich public to a new "lay sermon" with the "Herring" for a text. Mr. E. Jex, C.C., has discussed the vexed question of the destruction of small fish through under-sized nets in an exhaustive lecture on our "Deep Sea Fisheries." Last, but not least, Mr. R. B. Sharpe, of the British Museum has described the fish-eating birds for which the local waters are famous, and which constitute a striking feature of the exhibition. Meanwhile, the jurors have not been idle, and with the exception of the prize essays, &c., the list of awards is well-nigh complete. We are glad to believe that their decisions have been satisfactory, and we congratulate them on the manner in which they have completed a very onerous task. Another word of praise is due to the secretary, Mr. W. Oldham Chambers, whose management of the affair has resulted in so complete a success, and to the unwearying efforts of the president and committee. It may be worth noting that the exhibits which were specially mentioned by us last week occupy for the most part an honourable place in the prize list. Mr. Jardine's splendid collection of stuffed fresh-water fish has won for him a prize of £15, and one of £5 for a single specimen caught by the exhibitor, and the Piscatorial Society also carry off a £15 prize and diploma. Messrs. Cole and Gunn, the local stuffers, are also extensive prize-takers, and there are several awards for single specimens of fish taken in local waters. Mr. Rolfe—foremost of modern fish-painters—obtains a gold medal for his famous picture, entitled "Fishes from Old Father Thames," and a diploma for his unequalled collection. All things considered, the angling community deserve credit for a very handsome and varied display.

Before proceeding in our notice of the exhibits at the point where we left them last week, there are one or two general features of the exhibition which deserve attention. Among the objects of interest in the *annexe* is the magnificent collection of casts of fish made by the late Mr. Frank Buckland, and taken from the South Kensington Museum. It includes some splendid casts of salmon—one of 70 lb.—salmon with ova, and, as a curiosity, an angler fish in the act of swallowing a 4 lb. bass. Close to this interesting exhibit stands a model cottage by Messrs. Ihlee and Horne, of Aldermanbury, within which is shown Balmain's luminous paint—one of the most charming of modern scientific inventions. Its virtues have already been described in these columns, and the beautiful luminous glow which it gives out in the dark is something to be seen and remembered. It was much admired by the Royal party; and Mr. Colman, M.P., and other local yachtsmen have decided to have their yachts, buoys, &c., painted after this fashion. Anglers, too, will find it to be of special service, when, as so frequently happens, the fish "come on to feed" with the twilight, and the straining eye can no longer discern the tip of the float. It is very durable, and only a small quantity is needed to produce a beautiful light. Messrs. Ihlee and Horne—who are acting as Mr. Balmain's agents—have received a silver medal for their exhibit. We must

not omit to notice what is called the A B C process for the cleansing of streams polluted by sewage, and rendering them innocuous to fish life. This is invented by Mr. W. C. Sillar, shown by the Native Guano Company (Limited), Aylesbury, and the inventors claim to have solved one of the most difficult problems of the day—viz., the purification of our rivers. The sewage is received in tanks, and, having been purified, runs directly into the river. The purification is effected by chemical agency—viz., by a mixture of blood, charcoal, clay, and salt of alumina—and the result is that a perfectly clear and innocuous stream of water is produced. The deposit is dried and sold as manure, a fact which adds, of course, to the practical value of the invention. The entire experiment has been tried on an extensive scale at Aylesbury, and has proved a striking success. The exhibitors give the best proof of the genuineness of the process by showing a number of fish living and thriving in water which consists entirely of purified sewage. They have been awarded the £20 prize given by the Mayor of Norwich for the best “process for rendering innocuous to fish-life streams polluted by sewage and chemical or other works,” and also a silver medal. We may add that the benefits of an invention of this kind would be nowhere more appreciated than at Norwich, where the destruction of fish life through the pollution of the principal stream is very great. There is no more pitiable sight than that which is often presented in the summer season, when the surface of the water is strewn with the dead bodies of the fish which stock the local waters. We cannot refrain from noticing the exquisite little silver-mounted models of lifeboats presented to the Duke and Duchess of Edinburgh, on their marriage, by the British residents of St. Petersburg. These occupy a place on one of the central stands in the Hall, and have been the object of general admiration. Other items interesting to anglers are the models of fishing boats adapted for use on local waters, and, in another part of the exhibition, the pocket fishing and shooting boat which is exhibited by Mr. W. W. Meiter and Company, of London, and has received a bronze medal, weighs only 30 lb., can be packed into a portable compass, and is fitted with air-tight chambers which render it uninkable. It is a wonderful little contrivance, and should simplify some of the inconveniences and difficulties attending a prolonged fishing excursion.

So much for casual “notes and jottings.” We proceed now with the exhibits of fishing-tackle at the point at which we dropped them last week. We do not pretend to exhaust the list, but simply aim at selecting the most noticeable features in the display. First of all, we observe that Messrs. Alfred, of London, whose splendid show we have commended to our readers, have been awarded a gold medal for their anglers’ outfits, a £2 prize for a rod with fittings, &c., complete, for use in Norfolk and Suffolk waters, and a diploma for their artificial baits, bait-can with strainer, &c. Mr. C. J. Greene, of local fame, has also been successful in more than one direction, taking a bronze medal for his show of rods, tackle, bait, &c., and a £10 prize for a collection of tackle used in local waters. Among Mr. Green’s specialties is a rod inlaid with no less than 240 separate pieces of wood, beautifully coloured and fitted together. Messrs. C. Farlow and Company, of London, have a fine collection of flies, baits, winches and rods specially adapted for trout and salmon fishing. They also exhibit a new method of fastening the joints of a rod in place of the ordinary “hitcher.” This consists of a screw joint which never gives way with the repeated throws necessitated in fly-fishing, and is a convenience which the angler will know well how to appreciate. Messrs. Farlow’s rewards are a silver medal and diploma. Messrs. F. J. Williams and Company, who also score a silver medal and diploma, have a case containing reels, baits, weights, traces, gaffs, hooks, &c., two special features

being a new method of hook-tying, and a handy contrivance consisting of a light rod with a short butt for the pocket, and a landing-net handle carrying a similar joint. Mr. D. Slater, of Newark-on-Trent, goes in for cheapness as well as excellence, and his capital show of rods is advertised at economical prices. In addition to the ordinary exhibits, he has a novel form of rings for the rods and metal runners at the top joint. He has deservedly been awarded £10 for his collection of inland fishing tackle. The FISHING GAZETTE exhibit has received a silver medal. Messrs. Allcock, of Redditch, have a fairly-bewildering display of inland and sea tackle, shown in handsome cases; and have made an addition to the honours they have earned at Paris, Berlin, Wurtzburg, Sydney, and elsewhere, in the shape of a silver medal for “general excellence.” The “features” of this display are almost too numerous to mention. Mr. J. J. Rice, a local seller, has a neat show of the cheaper and lighter sorts of tackle, including a new registered pike hook. Messrs. G. Little and Co., of London, have a handsome collection of fishing requisites, consisting of rods, lines, flies—one case containing about 150 varieties for trout-fishing—patent phantom minnows, a large number of artificial insects, and an aluminium reel weighing only three ounces. This last is an extremely neat little invention, although it strikes us as being slightly luxurious and costly. The grand feature in Messrs. Little’s exhibit is the beautiful rod which the firm had the honour of presenting through the president of the exhibition to H.R.H. the Princess of Wales. The rod is in six joints, is mounted in gold, and is fitted with carved ivory stoppers, showing the Prince of Wales’ feathers. It was presented to the Princess in a jewel case, and accepted by her in her usual graceful fashion. As notified in our issue of last week, Messrs. Little have been rewarded with a gold medal and a diploma for their patent “phantom.” Other exhibitors in this section are Messrs. Eaton and Dellar, London, whose splendid salmon rods have gained for them a silver medal and diploma; Mr. J. E. Gold, of London, who wins a bronze medal for trout, spinning and other rods; and Messrs. Hardy Brothers, of Alnwick, who show improved winch fasteners and other novelties are accredited with a silver medal and diploma. A specialty in the collection is the celebrated “Egeria” fishing basket, exhibited by Messrs. Braddell, of Belfast, which is a repository of all that the sea fisherman can require. The hand and drift lines, fitted with chop sticks, &c., are finely manufactured, and the invention will be found to be of great practical use and convenience. We must not omit to mention the exhibit of Mr. R. B. Hovell, a Norwich manufacturer, consisting of a fishing case, containing a complete set of inland fishing tackle, with—a most important addendum—a compartment for luncheon and, we presume, a corner for the brandy flask. It is a perfect marvel of compactness, and well deserves the £4 prize awarded.

We have now, we think, fully completed our task so far as the fishing tackle is concerned, and may pass on to another department of the exhibition. This is the section devoted to pisciculturists, occupying one side of the *annexe*, and forming one of the most important, as it is perhaps the most generally interesting, of the exhibition. The aquaria, which are included in this class, we have already referred to, but we have said but little of pisciculture proper, as displayed in the breeding ponds and hatching apparatus employed in cultivating the rarer and more delicate species. The department may be described as the scene of perpetual life and activity. Fish emerging from the ova, baby trout, juvenile salmon, oysters in their nurseries, and other curiosities of nature, are open to the inspection of the curious or the scientific observer. One of the most attractive sights in this department is the collection of hatching apparatus, &c., from the establishment of the Marquis of Exeter, at Stamford. It includes a hatching-box for salmon and

trout ova, models of a fish pass, spawning bed for salmon and trout, tanks containing live specimens of hybrid trout, and other features of interest. The prizes taken by Mr. Silk, the manager, are £5 and a silver medal. Mr. Oldham Chambers, the secretary, is also an exhibitor in this section, and shows what he terms a scheme for utilising a waste stream of water and turning it into a fish-culture establishment. The model of this is on a most minute and elaborate scale, and consists of a building containing engine, pump room, aquarium, &c., a stream for salmon culture, and ponds and tanks for carp, tench, and the coarser varieties of fish. Tenacres are supposed to be occupied by the establishment, and the idea is, we believe, as novel as it is ingenious. Mr. Chambers, who is a prize-taker in another class also, has been awarded a gold medal for this exhibit, which was favoured with special notice by the Royal party on Easter Monday. Mr. Chambers further shows an improved hatching-box containing several novelties, and his other exhibits display a fertility of design and readiness of adaptation which do him infinite credit. Among the other features in this department is the invention shown by Mr. R. Cail, of Newcastle, entitled "Cail's Loch Swimming Salmon Pass," the merits of which will be familiar to readers of the FISHING GAZETTE. The scheme—which is one enabling fish, when weak and laden with spawn, to swim from a low to a high level—is illustrated in an elaborate series of designs, and is carefully explained by the inventor. The fish passes by easy stages through a series of open locks, and thus experiences no appreciable fatigue. Mr. Cail has been awarded a prize of £10 for the model fish pass, and he seems to deserve the recognition. The systems of culture in use at the Howistun Fishery (Mr. J. R. Gay), and those of Mr. C. C. Capel, of Kent, have also their illustration in this part of the exhibition. Mr. J. Andrews, of Guildford, exhibits a model of his establishment in full working order, and has been justly awarded the £15 prize given by the president. Mr. Harding, of Lynn, receives a silver medal for his collection, which includes samples of mussel and oyster beds, and apparatus associated with fish culture. Oyster culture, a very important department, is further illustrated in some fine stands, the work of Messrs. Barnards, Bishop and Barnards, of Norwich, who have received a gold medal. Galvanised wire netting being employed for the nurseries, in which the oysters are comfortably ensconced. We may add that Mr. Pank, of Norwich, takes the silver medal for the aquaria, which he neatly and efficiently constructed.

THAMES TROUTING.

THE season for trout fishing in the Lower Thames has not as yet been very productive of sport, owing to the continued prevalence of an easterly wind and boisterous weather, which has been all against the feeding of the fish. If all the accounts are true which I have heard from gentlemen themselves, there are great quantities of trout in the vicinity of all the weirs. I am satisfied myself as to the accuracy of these reports, but there are those who are always inclined to cast a species of unbelief on statements which are made, even when those statements have had verification. I know of one angler who has lost two good fish. One got away after it was hooked, and the other broke the tackle, and this is by no means an isolated instance of the loss of fish. Another angler, fishing where a trout was feeding, could not tempt the fish to take his bait, although he persistently tried all he could. Only let there come a favourable change in the weather, and then the trout will exhibit their feeding capacities in all directions, but not, in all probability, with the angler's tempting bait. There are no restrictions as to any process of angling for them. There are some methods that are considered more sportsmanlike, and therefore, the rule of any angler doing as he likes cannot be interfered
